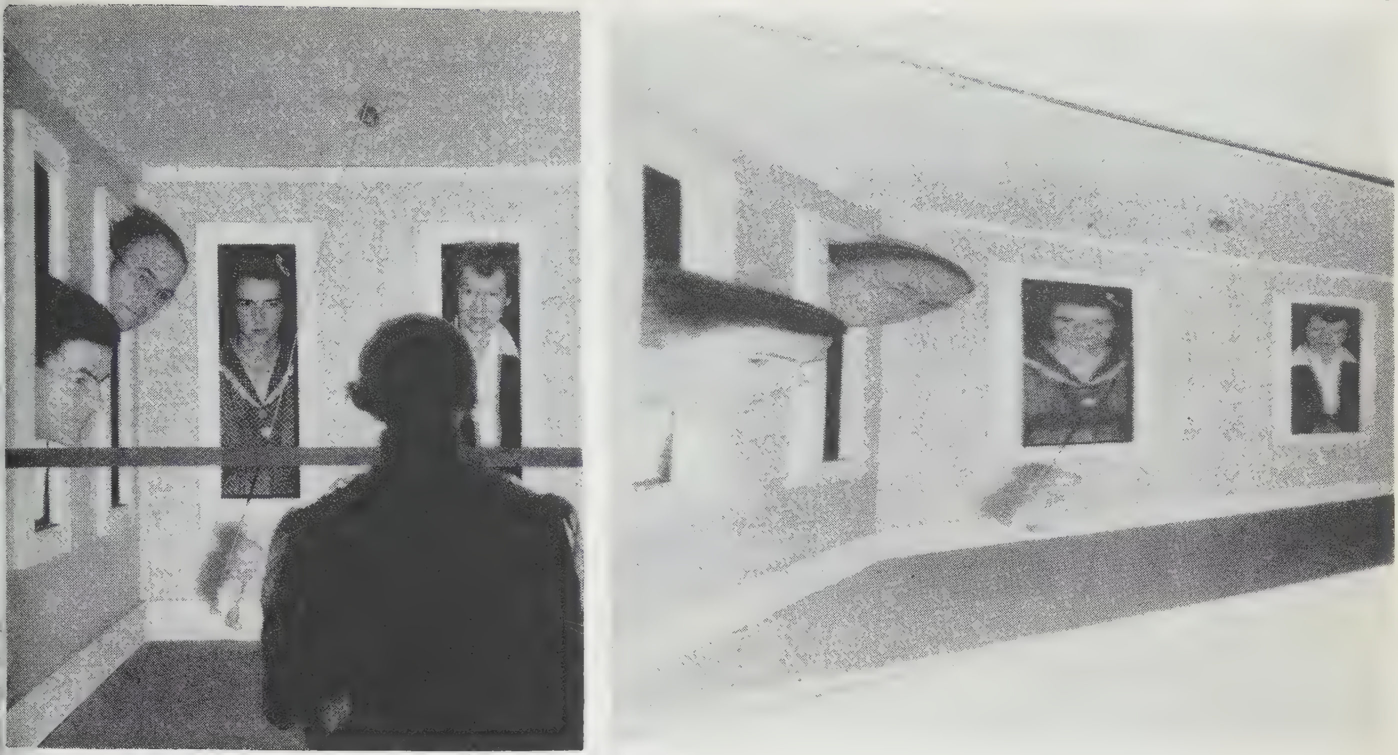
The first explanation for the epidemic was based on the p sumption that some industrial irritant was at fault, but that p sumption could not be substantiated. This theory was furt discounted when the disease was found to be contagious, ma non-shipyard workers becoming infected. The disease seemed m likely due to a virus type of infection, there being some exp mental evidences that this was the case. The disease tended be self-limited, the average case lasting about two weeks. Ea treatment with the sulphonamides and with X-rays seemed to beneficial in hastening recovery.

Syphilitic Optic Atrophy.—At least 8% of all persons suf ing from syphilis of the central nervous system have been fou to develop atrophy of the optic nerves. The incidence of bli ness in untreated cases of neurosyphilis has been high, up to 65 within three years from the time the disease was contracted. statistical study of the results of treatment of syphilitic op atrophy was reported from the Wilmer Ophthalmological in tute of Johns Hopkins university and hospital. The results w most satisfactory following induced malaria therapy by which incidence of blindness was reduced to 18% after three ye The authors of the report felt that malaria was the only efficaci method of treatment. Their studies showed progression of bli ness under other methods to parallel that in the untreated cases

Colour Vision in Industry.—In a study of the colour vision 7,000 workers in an Indiana industrial plant, it was found t those workers with deficiency in colour vision had in genera lower efficiency rating than those with more nearly normal col vision. There are various degrees of colour blindness rang



TEST CONDUCTED at the Dartmouth Eye institute for the study of aniseikonia, an eye affliction which produces distorted vision. At the left is a rectangular box as seen by a person with normal vision; at the right, the same box as seen through a pair of glasses ground to simulate aniseikonic vision

from inability to discriminate precisely between nearly related shades of colour to total colour blindness, a very rare condition. Plant efficiency was found to be increased by assigning workers to jobs requiring colour discrimination and acute vision on the basis of response to colour vision tests.

Night Vision in Aviation.—Study of the complete ocular functions of aviators in military aviation became increasingly important due to the visual problems associated with night flying. The problems of taking off from and landing on airfields with but dimly illuminated landmarks are quite different from those encountered in daylight flying. Careful studies of the dark adaptation, stereoscopic vision and depth perception in pilots and aviation cadets were leading to refined tests of these functions. The ophthalmic department of the royal air force devised three instruments called the rotating hexagon, the rotating stereogram and the rotating depth perception apparatus with which to study three of the principal ocular functions. From these studies, standards of efficiency were being established, which were increasing the safety of the air forces. (*See* also VITAMINS.)

Falk Foundation, The Maurice and Laura,

of Pittsburgh, Pa., continued its policy of financing economic research studies but with special emphasis in 1942 on the problem of postwar economic reconstruction. During the year the foundation appropriated to The Brookings Institution, Washington, D.C., $80,000 for a series of studies of significant phases of the problem of demobilization and economic reconstruction after the war, and $50,000 to finance the formulation of a postwar industrial program for the United States. Other grants by the foundation were $15,000 to the United War Fund and $2,500 to the American Red Cross. The Foundation also paid $50,000 on the principal of its grant of $300,000 to the Carnegie Institute of Technology for the endowment of the Maurice Falk Professorship of Social Relations and $8,333.33 for the expenses of the professorship 1942–43.

In 1942 the following publications were issued as reports on studies made under the foundation's grants: *Price-Making in a Democracy* (released by Brookings Institution as a series of pamphlets); *Refugee Settlement in the Dominican Republic* (Brookings Institution); *Output and Employment in Agriculture, 1899–1939* (National Bureau of Economic Research); *America's Factories Since 1899* (National Bureau of Economic Research); *Productivity of Labor in Peace and War* (Occasional Paper 7, National Bureau of Economic Research); and *Is There Enough Manpower?* (Brookings Institution). Farish, William Stamps

(1881–1942), U.S. oil executive, was born Feb. 23 in Mayersville, Miss. Three months after graduating from the University of Mississippi law school (1900), he went to Beaumont, Tex., as an oil prospector. By 1917, he was vice president of the Humble Oil company, which he helped to organize. During World War I, he served on the National Petroleum War Service committee, which handled oil supplies for the Allied nations. He later joined the Standard Oil Company of New Jersey, serving as chairman of the board, 1933–37, and president and chief executive officer, 1937–42. Farish died in Millbrook, N.Y., Nov. 29.

Fascism

The year 1942 marked in all probability the turning point in the fortunes of fascism as a movement of international importance. In Oct. 1942, the 20th anniversary of the march on Rome and of fascism's coming to power in Italy was celebrated. Yet the usual pomp and jubilation were conspicuously absent. It is true that in the 20 intervening years fascism had widely spread, not only in Europe but on all continents. The 20 years had witnessed the establishment of fascist governments in Germany, Hungary, Slovakia, Croatia, Rumania, Bulgaria, Spain, France and Japan; and semi-fascist governments had existed in Poland and Greece. In many other countries, especially in Latin America and the Union of South Africa, strong fascist parties existed. Practically no country was entirely free of them. Thus Signor Mussolini's proud forecast that fascism would be the political philosophy of the 20th century seemed on the road to realization. Yet the subdued mood reported from fascist Italy, as the year 1942 drew towards its end, cast heavy doubts on the ultimate fulfillment of fascist expectations. As against all the exaggerated claims of an alleged superiority of fascism as compared with "obsolete" and "decadent" democracy, of its higher efficiency and military invincibility, facts proved that fascism could reveal itself inefficient and that democracies could surpass it even in the art of warfare, which fascism acknowledged as its most proper domain.

The year 1942 saw an ever closer co-operation between the European brand of fascism represented by Germany and the Asiatic brand represented by Japan. On Feb. 4 the German radio broadcast to Asia that German and Japanese gods were symbols of the "same pure Aryanism," that Wotan, the leading god among the Germans, and Amaterasu, the Japanese sun goddess who is the ancestor of the Japanese imperial house, are "similar in character and meaning" and that "both gods are watching over their people to keep them in military and patriotic spirit." Japanese fascists under the leadership of Toyoma Nakano maintained that the Japanese emperor, as a descendant of the sun goddess, is destined to rule the earth as its ancestor rules heaven, and that Japan can never rest until the whole of mankind is one household under the paternal sway of the Japanese emperor. In spite of this glorification and deification of the emperor, the emperor had become a mere figurehead and the real power in fascist Japan was in 1942 in the hands of prime minister Hideki Tojo, who apparently wished to revive the days of the Shogunate. The needs of the war were made an excuse for converting Japan entirely into a one-party fascist state. The Imperial Rule Assistance association, founded by Prince Fumimaro Konoye, became the only political party in Japan with the prime minister as its leader. All resistance to Japanese policy and the Japanese war aims was viewed as resistance against the divine law which had singled out Japan for the unification of mankind. Though it was in no way certain whether this plan of global unification under the leadership of one of the two great fascist powers might not ultimately lead to a clash between Germany and Japan, should these two powers be victorious, nevertheless both of them stressed the close spiritual affinity and solidarity which doubtless existed between them.

While fascism gained strength in Japan and prepared itself and the country for a long struggle, the disintegration of the fascist party in Italy became manifest in the repeated removals from
the party of members "found guilty of unethical conduct in t
face of the war emergency." A meeting of the fascist par
directorate on May 26 decided to eliminate all those party me
bers who "do not deserve the honour" of being in the party, esp
cially all those who held very remunerative jobs in commerci
administrations and continued their speculations in the econom
field. By August 14, 1942, a meeting of the national directora
of the party reported an initial dismissal of 66,000 party membe
for different reasons including speculation and food traffic on t
black market, and these dismissals were soon to be followed
many others.

In the democratic countries and those of their allies fasci
movements and sympathizers were put under much closer supe
vision, and in some of them they had to abandon their activitie
In the United States, federal grand jury investigations accused
number of persons and publications of fascist propaganda or
co-operation with fascist countries. Some of the more extremi
pro-fascist publications ceased to appear, others had their post
privileges withdrawn, some of the leaders were arrested, and pr
ceedings of de-naturalization were instituted against persons fou
loyal to fascist countries, especially against members of t
German-American bund.

In those Latin-American countries which had either declar
war on or broken relations with the fascist powers, fascist prop
ganda, frequently supported by the Spanish Falange, was strict
supervised. But it was different in Argentina, where the "Allian
of Nationalistic Youth," the local counterpart of the Europe
fascist movement, enjoyed the protection of the governme
which showed openly some sympathy for the axis powers. Follo
ing the European example, the fascist youth of Argentina select
three "martyrs," Jacinta Lacebron Guzman, Julio Benito de Sa
tiago and Francisco Garcia Montano, who had been killed aft
fights with anti-fascist groups in 1934 and in 1938. The Allian
adopted an emblem, three upright lances in the form of t
tacuara, a native Argentina weapon consisting of a point of ste
lashed on with a rawhide to a shaft of bamboo. The leader of t
Argentinian fascist group in 1942 was Juan Bautista Molina,
retired general. The fascist movement in Chile was of much le
strength than that in Argentina.

Curbs were also placed on the fascist movement in Sou
Africa, the Ossewa-Brandag, or "covered wagon sentinels," a
extremist Boer organization, violently anti-British and pro-Ge
man. At the beginning of 1942 a subversive plot of dangero
dimensions was discovered among the police officers of Johanne
burg. On the other hand, the military successes of the Unite
Nations brought with them a weakening of fascist influences
the Arab countries and in India. Yet fascist propaganda co
tinued ceaselessly its activities for undermining the democrat
powers. Its main lines remained unchanged: they were directe
against British imperialism, against the Jews, and against co
munism. And by a dexterous use of insinuations, distortions a
emotional appeal to prejudices fascist propaganda remained to
certain degree successful in its efforts to confuse and disunite t
democracies. (*See* also ANTI-SEMITISM; COMMUNISM; DEMO
RACY; GERMANY; ITALY; JAPAN; RUMANIA; SPAIN.)

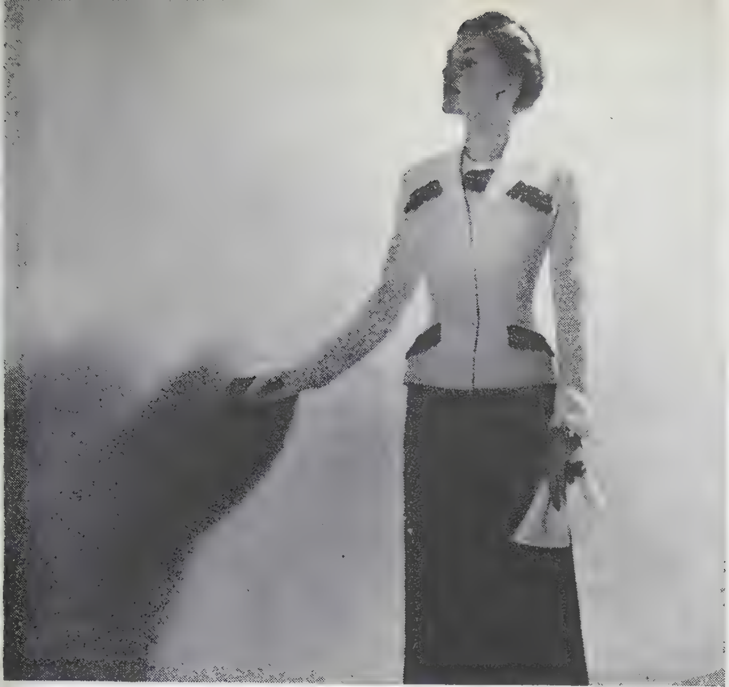
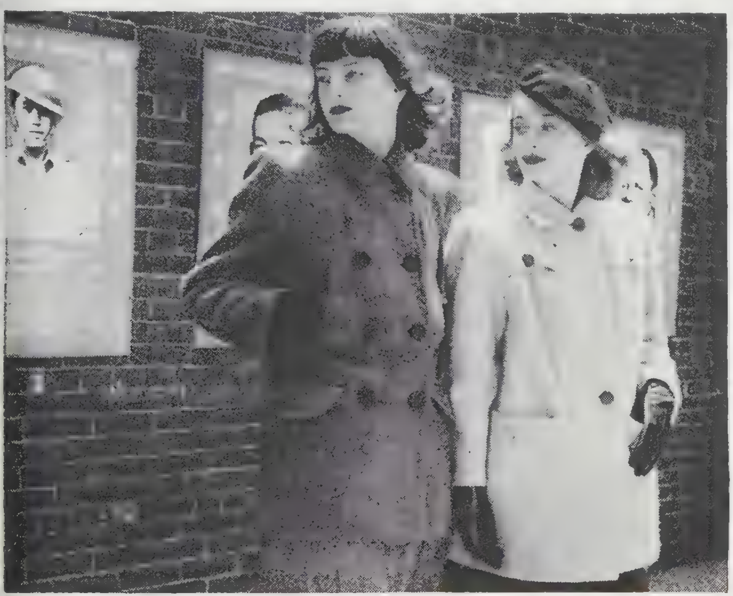
Fashion and Dress.

The war, psychologically and mat
rially, had an overwhelming infl
ence on the fashions of 1942. The common denominators in a
clothes were economy of cut, comfort, adaptability and a gre
simplicity.

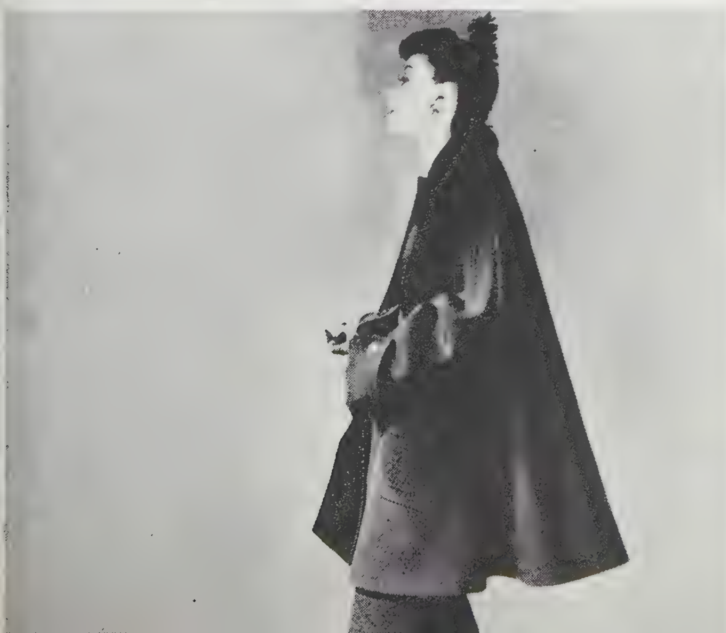


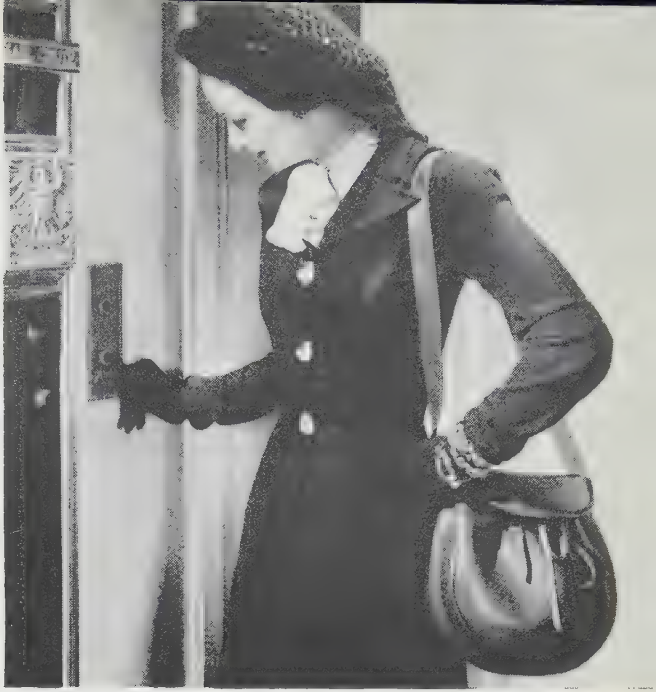
A DINING-OUT DRESS, summer of 1942, designed by Mainbocher. The skirt is of black linen, the short jacket of white linen trimmed with emerald green beads



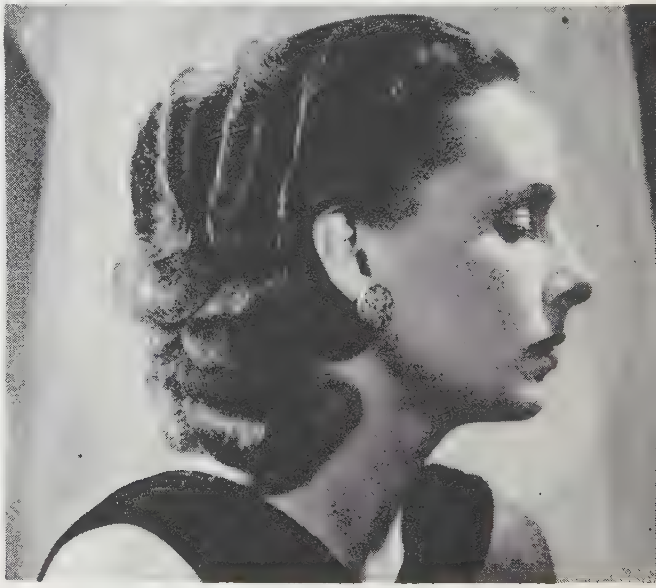
SHORT BULKY JACKETS, reminiscent of U.S. sailors' winter jackets, were worn by college girls in the autumn of 1942

SWING-BACK COAT, designed by Falkenstein, intended to look a little too big for the wearer. It is of black wool with a velvet collar





THE HANDBAG strung over the shoulder with a strap returned to favour in 1942



HAIRDRESS of 1942

"DIMOUT EVENING COAT" of 1942, of black wool studded with black paillettes, worn over a short evening dress. The net shawl is studded with the same paillettes

The U.S. government rulings directed at curtailing the use of materials urgently needed for the armed forces and their equipment, shortened dresses and jackets, banished over-full and accordion-pleated skirts, all unnecessary pockets, tabs and trimmings. These restrictions, plus woman's wartime instinct to intensify her femininity, forced manufacturers to a new virtuosity in designing and in cutting.

One outfit that could hold its own anywhere in the country—at a Texas airfield, an army camp in the Dakotas, or on the sidewalks of New York—was worth three with place limitations to women called upon to change their lives and their locales on short notice. Following a trend started by the uniforms of WAAC's, WAVES, Red Cross and A.W.V.S. workers, the suit—especially the gray flannel suit—became the personal daytime uniform of women out of uniform. Low-heeled shoes of polishable leathers, and shoulder-strap bags that left hands free for carrying bundles and getting out bus fares, had a sweeping popularity. The felt cloche hat—a memoir of the last war—suitable to debutante and dowager on the job or on the go, reappeared, and with it the inexhaustible beret. Based on the demands of trim-collared uniforms, and on the emphasis everywhere on neatness, hair was more and more swept up off the face, up off the neck.

Bright little ribbon bows, attached to clips or combs, were sold by the millions to tuck into the new coiffures.

After dark, in contrast to the daytime strictness, the eternal woman blossomed out in frilly blouses, and dresses with a flutter of ruffles. With an eye to unrehearsed evenings on dimmed-out and often taxiless streets, the short dinner dress almost entirely displaced the floor-length dress except for rare full-dress occasions and for cold country houses where legs were grateful for coverage. This short-skirted evening dress ran from the simplest long-sleeved black crepe to stiff formal satin with full decolletage—a fresh, underivative note in fashion. Satin evening suits that could be bought with both a long skirt and a short one to fill a variety of bills were a whole evening wardrobe in themselves. With all of these, the high-heeled, ankle-strap slipper, heightening the allure of legs and ankles, became a rage. The most important evening accessories were the crocheted wool shawl and the crocheted wool fascinator worn over the head—both usually spattered with bright-colored sequins.

The coat of the year was unquestionably the classic, velvet-collared Chesterfield in black or brown woollen, sometimes in fur. It even became an evening coat—in black tweed lined in white ermine or flecked with brilliant paillettes. The trench coat returned and went through almost as many transmutations. U.S. seamen's jackets, Winston Churchill jackets and a copy of a jacket worn by Gen. MacArthur were copiously adopted by the young.

Smartest of all the fingertip coats was one in black wool cut with a wide, circular back-swing.

The wool shortage, coupled with fuel rationing and the threat of heatless houses, hastened the development of revolutionary warm fabrics . . . notably aralac, made from skimmed milk, and nylon fleece. Cotton, which during the summer was handled with a sophistication that made it as city-bred as silk, was developed in new tweed-like textures and became a popular winter fabric as well. By November, the new rayon stockings and every conceivable mesh, rib and weave of cotton stocking solved the cold weather problem of women who spent the summer camouflaging their bare legs with make-up. The halted production of zippers and metal fastenings promoted a research into other methods of fastening that resulted in ingenious wrap-around, tied-on dresses and in the drawstring dress which became an easy favourite with the young. Fawcett, Edward (1867–1942), British anatomist, was born May 18, and received his medical training at Edinburgh university and the Edinburgh school of medicine. He remained at the latter school as demonstrator in anatomy and later did similar work for Yorkshire college. He was professor of anatomy at University college, Bristol, 1893–1909, dean of the faculty of medicine at the college, 1905–09, and dean of the faculty of medicine at the University of Bristol, 1909–34. He was president of the Anatomical Society of Great Britain and Ireland, 1927–29. Dr. Fawcett made important contributions to the literature of anatomy and embryology, particularly on the development of the human skeleton, and he was an authority on church architecture. He died in Bristol, England, Sept. 22.

Federal Bureau of Investigation. During the fiscal year 1942, 7,448 convictions were secured in cases investigated by the Federal Bureau of Investigation, with sentences imposed totalling 1 death, 8 life, 17,163 years, 6 months and 4 days. Of these convictions 1,473 were secured in cases involving espionage, sabotage, un-American activities, and violations of the Selective Service act, as against 412 such convictions during the fiscal year 1941.

Three thousand eight hundred twenty-seven federal fugitives from justice were located and apprehended by special agents of the FBI during the year 1942. When their fingerprints were identified by a search through the fingerprint files of the FBI 7,506 fugitives were located for state, county and municipal law enforcement agencies.

The attack on Pearl Harbor, Dec. 7, 1941, found the FBI completely mobilized on a wartime basis. Its trained personne was increased almost two-fold, and every facility of the FBI wa taxed to the utmost during this period. In the fiscal year ending June 30, 1942, 218,734 national security matters were reported t the FBI for investigative activity as against 68,368 for the fisca year 1941 and 16,885 for the fiscal year 1940.

From the outbreak of war on Dec. 7, 1941, until Nov. 18, 1942 12,023 aliens of enemy nationality were arrested by the FBI an co-operating peace officers. Of this number, 5,018 were Japanese 4,736 were Germans and 2,253 were Italians. There were als eight Hungarians, seven Rumanians and one Bulgarian. Thos not immediately released were held for hearings before the enem alien hearing boards, which make recommendations to the attorney general as to whether the aliens should be interned, released or released on parole. Large amounts of prohibited material wer seized in widespread spot searches of the homes of alien enemie held by them in violation of presidential proclamations. Thi contraband, as of Nov. 3, 1942, included 4,155 guns, 257,91 rounds of ammunition, 2,497 short-wave receiving sets and 1 short-wave transmitting sets, 3,664 cameras and enough camer equipment to stock a photographic supply house. Among explosives seized were 2,340 sticks of dynamite, 2,828 dynamite cap and 3,787 feet of dynamite fuse. In addition, hundreds of photographs, maps, charts and documents containing confidential information about U.S. defenses were seized.

Fifty-six persons were convicted of espionage activities or fo failure to register as foreign agents during the fiscal year 194 resulting in sentences totalling 442 years, 11 months and 1 day Fines, savings and recoveries amounted to $48,217.90. Two majo spy rings were broken during the year and members of other were in custody and awaiting trial as the year ended.

While 218 persons were convicted of sabotage in the fiscal yea

1942, there was no evidence of any single act of foreign-directed sabotage. Those who were prosecuted for this crime acted willfully and not as the result of axis direction. The industrial damage which occurred was the result of malicious mischief, industrial accidents, and was in part due to the efforts of disgruntled employees. The 218 convictions resulted in prison sentences of 396 years, 11 months and 29 days.

Two convictions for sedition were secured during the year, and other persons were under indictment as the year ended.

In Selective Service violations, from the first registration day on Oct. 16, 1940, through Oct. 31, 1942, 2,062 violators had been convicted and received sentences totalling 3,792 years, 2 months and 15 days. In many aggravated cases the maximum sentence of five years in prison was pronounced. The primary purpose of investigations under this act is to enforce the law and to furnish manpower for the army rather than to take prosecutive action. As a result of this policy, 59,614 delinquent registrants were located who later complied with the provisions of the act.

As a result of investigations performed by the FBI, 35 aliens were deported from the United States and its possessions during the fiscal year 1942. They were involved in violations ranging from Selective Service irregularities to espionage. Consular offices of the German and Italian governments in the United States were closed July 15, 1941, as a result of FBI investigation at the request of the state department.

Pertinent information gathered by the FBI and co-operating peace officers is forwarded to the military intelligence service and to the office of naval intelligence for the assistance of the army and the navy in carrying on their functions in the war. The FBI also co-operates in a similar manner with other government agencies. Through this liaison arrangement hundreds of thousands of names were searched through the FBI files for other government departments during the fiscal year 1942.

The plant survey work of the Federal Bureau of Investigation was discontinued Jan. 5, 1942, when the war and navy departments assumed the responsibility for the survey of factories working on war materials. During the fiscal year 1942, 928 surveys were completed by the FBI.

Bank Robbery and Kidnapping.—Although emphasis was placed upon wartime work, the regular criminal investigations performed by the FBI were pursued as usual. There were 94 federal convictions in bank robbery cases during the fiscal year 1942. Prison sentences amounted to 764 years, 11 months and 17 days. Fines amounted to $42,000 while loot recovered totalled $15,952.16. Seventy-three fugitive bank robbers were located during the year. Since the peak year 1932, when 606 bank robberies occurred, there has been a decline of 91.4% in bank robberies.

From the passage of the Federal Bank Robbery act in 1934 to June 30, 1942, a total of 953 bank robberies were investigated by the FBI, resulting in 659 convictions in federal courts with the imposition of sentences totalling 2 death, 14 life, and prison terms amounting to 10,828 years, 3 months and 24 days.

Thirty persons were convicted during the fiscal year 1942 in kidnapping cases investigated by the FBI, resulting in one life sentence and prison terms of 425 years. For the ten-year period since the enactment of the Federal Kidnapping statute, June 22, 1932, there were 225 kidnapping cases and all but two were completely solved.

Fingerprints.—The identification division experienced the greatest growth in its 18 years of existence during the fiscal year 1942. There were 22,031,370 fingerprint cards received in this single fiscal period, which more than doubled the number received in the preceding 17 years. There were 42,874,078 prints on file June 30, 1942. The average number of prints received daily throughout the year was 52,470 as against 17,200 for the previous year.

Law-abiding citizens continued to take advantage of the opportunity to afford themselves a positive means of identification in case of amnesia, accident, death or disaster by voluntarily placing their fingerprints on file in the civil section of the identification division.

The war emergency caused the increase in the number of prints received with the ever-expanding use of this means of identification by the armed services, federal civil service, law enforcement agencies, and industrial plants employing workers on war production. A total of 1,523,438 prints were received from the federal civil service, and the value thereof can best be judged by the fact that a check of these prints against FBI records revealed that one out of every 19 persons seeking a position of trust with the government through civil service had a prior arrest record.

Research and Training.—The heavy increase in work for the FBI technical laboratory kept pace with the wartime work of the nation. In the fiscal year 1942, a total of 51,475 scientific and technical examinations were conducted by the laboratory in contrast with 14,589 examinations made during the fiscal year 1941. The 51,475 examinations involved 93,009 specimens of evidence. Research continued in scientific crime detection to devise new and better methods to solve the many problems arising in the handling of espionage, sabotage and other related investigations.

It was necessary for the FBI to intensify and enlarge its training programs to thoroughly equip the newly appointed special agents as quickly as possible. Three sessions of the FBI national police academy are usually held each year, but due to the war emergency it was necessary to cancel the academy session scheduled to start in Jan. 1942. A total of 702 carefully selected local law enforcement officers were graduated from the 20 sessions which had been completed. Following their graduation these men returned to their home communities and established police training schools.

Conferences are held with local peace officers four times each year throughout the United States, Hawaii, Alaska and Puerto Rico to afford instruction to officers in the investigative techniques and problems arising out of espionage, sabotage and other national security cases. Two specialized schools were conducted for police in every section of the country. A series of civilian defense courses for police executives and police was instituted in the fall of 1941 designed to educate American officers in all problems of law enforcement under wartime conditions.

In Feb. 1942 a series of war traffic schools was inaugurated on a nationwide basis to give officers specialized training in the problems arising out of increased traffic caused by the war. A total of 438 civilian defense and war traffic schools was conducted, attended by 39,658 police executives and police officers representing over 7,000 agencies.

Since Sept. 1930 the FBI has acted as a central clearinghouse for crime statistics. Data concerning offenses committed, crimes cleared by arrest, persons arrested and the number found guilty are forwarded to the FBI by local law enforcement agencies throughout the U.S. in the form of monthly and annual reports. The data are tabulated on a calendar year basis and published in the *Uniform Crime Reports* bulletin. (*See* also CRIME; KIDNAPPING; POLICE; SECRET SERVICE.)

(J. E. H.)

Federal Communications Commission.

The regulatory agency of the federal government over interstate communications, by wire and radio, underwent a revision in its work program during 1942 as a result of the United States' participation in World

War II. Emphasis was put upon conservation and limitation of peacetime facilities, while expansion was organized for communications services in military and defense areas.

The monitoring branch of the FCC, which informed the government of the content of foreign broadcasts, and the intercepting branch, which policed the air to prevent its use within the nation by the enemy or subversive groups, were materially expanded.

According to the analysis of the monitoring branch—the foreign broadcast intelligence service—the principal objective of enemy propaganda during the year was to spread defeatism and the feeling of futility throughout the United Nations. German, Japanese and Italian broadcasters spoke continuously of real or fancied deficiencies in the U.S. and British war effort. Conversely, the strength of the axis was emphasized and exaggerated. Reports of broadcasts were furnished to all government officials active in the prosecution of the war. Considerable information from this source was released to the public press through the Office of War Information (*q.v.*).

The intercepting branch—the radio intelligence division—collaborated with the intelligence services of the armed forces and law enforcement agencies in their programs of counterespionage and studies of enemy movements. Its field forces were expanded considerably during 1942.

Expansion of telephone facilities and other wire services was authorized in congested defense production areas. To fulfil the needs of U.S. world-wide operations, many new telegraph and telephone circuits to overseas points were instituted. Steps were taken to expand short-wave facilities used in psychological warfare.

On the other hand, the commission authorized new domestic radio stations and changes in existing facilities involving the use of critical material only to meet military or vital public needs.

Litigation with the National Broadcasting company and the Columbia Broadcasting system, over the commission's regulations designed to foster competition in network operations, continued through 1942 as the companies sought to enjoin enforcement. A three-judge district court in New York city first ruled it was without jurisdiction but after reversal by the supreme court ruled in favour of the commission on the merits on Nov. 16, 1942. The supreme court of the United States was to review this decision early in 1943. (*See* also RADIO.)

Section 606 of the Communications Act of 1934, as amended, which contained war powers over communications, was expanded by the 77th congress to extend over wire line communications the same control previously written for radio. Under this section the president was empowered to cause the closing of communications apparatus or authorize the use or control of any equipment upon just compensation to the owner. The president delegated these powers to the Board of War Communications, headed by James Lawrence Fly, chairman of the Federal Communications commission.

Congress considered two other bills which would have had considerable importance. The first, H.R. 5497, introduced by Representative Sanders of Louisiana, proposed to alter the present structure of the commission and to amend many important procedural provisions. It was the subject of hearings before the house Interstate and Foreign Commerce committee but the bill died with the adjournment of congress before reaching the floor. The second, S. 2445, as passed by the senate on June 22, 1942, would have amended the Communications act in order to permit merger of domestic telegraph operations. This permissive legislation as reported out by the house committee on Nov. 30, 1942, extended merger provisions to international radiotelegraph and cable companies as a separate venture, but congress adjourned *sine die* before the bill was acted upon by the house.

On Nov. 21, 1942, the commission ordered the American Tel
phone and Telegraph company to show cause why its long-di
tance toll charges should not be substantially reduced. Hearing
were begun on Dec. 16, 1942. (*See* also WAR COMMUNICATION
BOARD OF.) (J. L. FY.)

Federal Council of the Churches of Christ in America.

In 1942 the council consisted of
national denominations; one add
tional body, the Ukrainian Orthodox Church of America, cam
into the membership of the council during the year. The memb
denominations of the council included most of the major Protes
ant bodies and two churches of the Eastern Catholic group (th
Syrian Orthodox and the Ukrainian Orthodox). The total mem
bership of the constituent denominations in 1942 was 25,076,56
with local congregations of approximately 140,000.

Through the general commission on army and navy chaplai
the recruiting of ministers for religious work in the army ar
navy was carried on. Through the Christian commission for cam
and defense communities guidance was given to local church
facing new responsibilities because of their proximity to cam
or wartime communities. The commission on aliens and prisone
of war launched a program for securing the co-operation of loc
churches in the resettlement of Japanese Americans as they we
released from the government camps. The committee on forei
relief appeals continued its work in co-ordinating the work of t
churches in securing support for refugees, prisoners of war, Chi
relief, missionaries cut off from their normal bases of suppo
and other wartime works of mercy. The commission to study t
bases of a just and durable peace held a national conference
Ohio Wesleyan university to formulate basic principles for whi
the churches could stand. A new commission of the churches
democracy in racial and cultural relations was appointed for t
purpose of making a co-operative approach to racial problems
the light of the experience of the war.

A plan for uniting the federal council and seven interdeno
national agencies working in more specialized fields, such as t
Foreign Missions Conference of North America and the Ho
Missions Council of North America, was put forward and a
proved at the biennial meeting of the federal council held
Cleveland, Ohio, Dec. 8–11. If endorsed by the other interd
nominational agencies the plan was expected to go to the offic
governing bodies of the churches of both the United States a
Canada for final ratification.

The council continued its work in the fields of evangelis
worship, family life and social service. Ten religious progra
over national radio networks were presented each week throug
out the year. The *Federal Council Bulletin* (monthly) and
formation Service (weekly) continued to be published.

Federal Crop Insurance Corporation: *see* AGRICULTU

Federal Deposit Insurance Corporation.

Insured banks of the United States continued during 1942
lend financial support to the country's war effort, meeting
financing needs of government and of industry as they arose.

Improvement in asset values and in earnings continued throu
out the year, with the result that only six insured banks fai
during 1942, the lowest number since the inception of depo
insurance on Jan. 1, 1934.

By the end of 1942 capital and surplus of Federal Depo

Insurance corporation had grown to more than $600,000,000. The corporation's income during the year amounted to about $60,000,000.

About $50,000,000 was derived from insurance assessments paid by banks and about $10,000,000 from income on investments.

From the beginning of deposit insurance through Dec. 31, 1942, there were 390 insured banks closed or merged with financial aid from FDIC.

These banks held deposits of $486,000,000, of which $477,000,000, or 98%, were made available promptly without loss to depositors. Of the 1,266,000 depositors in these banks, only 1,966, or less than one-fifth of 1%, held accounts in excess of $5,000 and were not fully protected.

These 390 cases involved outlays by the corporation totalling $251,000,000, of which it was estimated that 80% ultimately would be recovered.

There was no legislation during 1942 that altered the status, the functions, or the powers of Federal Deposit Insurance corporation. (*See* also BANKING.) (L. T. C.)

Federal Housing Administration: *see* NATIONAL HOUSING AGENCY.

Federal Land Banks.

The land banks and local national farm loan associations operated after 1933 under the supervision of the Farm Credit administration which also supervised other federally sponsored co-operative lending institutions. The 530 production credit associations made production credit loans to farmer members and the 13 banks for co-operatives made operating capital, commodity and facility loans to farmers' co-operatives. The 12 federal intermediate credit banks acted as banks of discount for production credit associations, banks for co-operatives, and other agricultural lending institutions.

Federal land bank operations in 1942 reflected a marked tendency on the part of farmers to reduce their indebtedness. Large repayments on the principal of federal land bank and commissioner loans, totalling $303,011,459 with many farmers paying off their entire loan, and a decreased demand for new loans, reduced the amount of federal land bank and commissioner loans outstanding to $2,115,043,460, the lowest since 1933. However, other farm mortgage lenders reported a similar trend. As a result, the total United States farm mortgage debt at the beginning of 1943 was estimated to be about $300,000,000 less than on Jan. 1, 1942. About 33% of the total farm mortgage debt, estimated at about $6,400,000,000, was held by the federal land banks and Federal Farm Mortgage corporation.

Large repayments on the principal of loans gave the land banks ample funds to make new loans without issuing any farm loan bonds, the usual source of land bank loan funds, in 1942. Farm loan bonds outstanding on Dec. 31, 1942, aggregated $1,532,687,140.

The interest rate paid by farmers with loans through national farm loan associations and by commissioner borrowers in 1942 was 3½%. This rate was effective temporarily by act of congress, and the United States government reimbursed the banks and Federal Farm Mortgage corporation, which finances commissioner loans, for the difference between the contract rates and the reduced rate. The contract interest rate on most federal land bank loans made during 1942 was 4% and on commissioner loans it was 5%.

The total capital of the 12 federal land banks on Dec. 31, 1942, was $217,506,257, of which 46.1% was owned by national farm loan associations and individual farmers borrowing directly from the banks. The remaining amount was provided by and was owned by the United States government.

Federal Reserve System.

Manifold requirements of the rapidly expanding war program of the United States in 1942 imposed unusual demands upon the federal reserve system. Emergency aid was given in the form of relief to the banks, financing production of war munitions, alleviation of essential civilian needs, and co-operation with the treasury in the sale and distribution of war bonds and other obligations.

Congress was called upon to amend the Federal Reserve act to facilitate broader participation by the federal reserve system in the U.S. war effort. The Second War Powers act, approved March 27, 1942, contained a provision authorizing the Federal Reserve banks, during the emergency period and within certain limitations, to purchase or sell obligations of the United States directly from or to the United States.

An important executive order (No. 9112) was issued March 26, 1942, by President Roosevelt, empowering the war department, navy department and Maritime commission to guarantee loans made by commercial banks and other institutions for war purposes and to use the facilities of the federal reserve banks as fiscal agents to expedite such transactions. Operating under Regulation V, adopted April 11 by the board of governors to implement the executive order, 2,646 loans aggregating $2,662,000,000 were authorized through federal reserve banks during 1942. About 57% of such loans were for amounts of $100,000 or less.

Bank deposits, following the upward tendency of the preceding year, increased by $16,000,000,000 during 1942 to a total for all banks in the United States of $85,000,000,000 on Dec. 31, largely attributable to heavy accumulations of government securities. Bank credit continued to expand rapidly. At the close of the year, commercial banks held about $39,000,000,000 of United States government securities, an increase during 1942 of 80%. Federal reserve bank holdings amounted to $6,000,000,000. Together these purchases represented two-thirds of the increase in all marketable issues.

Ascendancy of war expenditures over normal business transactions toward the close of 1942 resulted in an increasing percentage of bank loans going for war purposes. For the entire year, the volume of commercial loans declined, reversing the 1941 trend.

Restrictions on consumer credit, initiated in Sept. 1941, were extended in 1942 by the board of governors of the federal reserve system. Through a revision of Regulation W, monthly charge accounts were brought under regulation, more articles were added to the restricted list, down payments were increased, and maximum maturities reduced. During the first ten months of 1942, the volume of instalment debt declined from $5,900,000,000 to $3,300,000,000.

Liquidation of automobile debts and rationing rules affecting automobiles accounted for much of the decline. (*See* also CONSUMER CREDIT.)

The rapid rate of currency outflow into circulation during 1940 and 1941 was accelerated during 1942, attaining a record monthly average of $500,000,000 during the last few months of the year, compared with a rate of about $200,000,000 a month in the corresponding period of 1941. On Dec. 31, 1942, money in circulation totalled $15,400,000,000, compared with $11,200,000,000 at the end of 1941. Major factors in the unprecedented outflow of money into circulation were the expansion in wages and salaries, heavy purchases by consumers, failure of many families with increased incomes to make use of banking facilities, and hoarding by some.

Holding of a large reservoir of idle reserves by banks of the United States—a common practice in normal times—was discouraged during the war period by a federal reserve policy of assuring banks of ample reserves through various devices undertaken by the system. The abnormal amount of money in circulation and the large increases in required reserves on account of the security purchases by banks contributed to a marked decline in the volume of bank reserves in excess of legal requirements during 1942. In August the excess reserves of New York city and Chicago member banks were the lowest since 1937. To maintain orderly conditions in the government security market and to provide reserves needed by banks as a basis for purchases of United States securities, federal reserve bank holdings of government securities were increased from time to time.

On Aug. 18, 1942, in accordance with provisions of an act of congress approved July 7, authorizing the board to change reserve requirements of member banks in central reserve cities without changing requirements in other reserve cities, the governors announced a reduction from 26% to 24% in reserve requirements against net demand deposits for central reserve city banks in New York city and Chicago. This reduction of 2 points was followed by two others of similar size, on Sept. 14 and Oct. 3, bringing the reserve requirements in those cities down to 20%, thus providing about $1,300,000,000 of additional excess reserves.

Rediscount rates at all reserve banks were lowered to ½ of 1% on government securities maturing within one year, and rates on other paper were also reduced. The Federal Open Market Committee pursued a policy of buying treasury bills at a rate of ⅜ of 1%, with a repurchase option available to sellers.

The board of governors in 1942 was composed of Marriner S. Eccles, chairman; Ronald Ransom, vice-chairman; M. S. Szymczak, John K. McKee, Ernest G. Draper and R. M. Evans. (*See* also BANKING.)

Federal Works Agency.

In 1942 the Federal Works agency and its constituent units concentrated almost exclusively upon projects deemed to be essential to successful U.S. prosecution of the war.

In accordance with provisions of the Lanham act, under which $300,000,000 was appropriated to the agency for public works in defense communities unable themselves to supply such facilities, work was begun upon 1,700 projects approved by the president, costing approximately $275,000,000. Of this sum, about $65,000,000 was contributed by participating local communities. Included in the program were nearly 600 schools, 325 recreation facilities, 300 hospitals, 230 water systems, 210 sewer systems and a number of miscellaneous structures. Because of the scarcity of many materials essential to the primary war effort, the agency was forced to confine its activities largely to temporary construction. The war-housing phase of the Lanham act program was transferred to the National Housing agency by executive order of the president Feb. 24, 1942.

As of that date the Federal Works agency had completed 60,000 family dwelling units, and had placed 91,478 units under contract.

Twenty-nine new temporary buildings were erected by t Public Buildings administration in the District of Columbia f the use of expanding government departments, and constructi of the first 12 of 22 residence halls to accommodate governme employees in overcrowded Washington was begun. The 12 re dence halls were designed to accommodate 7,800 women. T administration removed 22 government agencies, or parts of age cies, from Washington to other cities in connection with the fe eral decentralization program.

The Public Roads administration completed, at a cost of $27 377,000 (of which 59% was furnished by the government), 10,1 miles of roads and eliminated 237 highway-railroad grade cros ings. The greater part of this work was on roads essential f military or war production purposes. The first of a number flight strips, to provide emergency landing and take-off faciliti for military aircraft, was completed. Late in the year throu traffic was moved for the first time over the Alaska highwa built as a joint undertaking by the Public Roads administrati and the army corps of engineers.

The Work Projects administration provided employment f an average of 1,000,000 persons in the fiscal year ended June 1942. The number of workers was reduced to 698,000 in Ju and further reductions occurred during the remainder of the ye All persons on the WPA rolls were reclassified late in the ye either for direct employment in private industry or agricultu or with a view to their training for employment in war produ tion. The appropriation ($875,000,000) for the 1942 fiscal ye was the smallest authorized in nine years of WPA operation. T appropriation for the 1943 fiscal year was still further reduced $275,000,000.

A fourth constituent unit of the Federal Works agency— Public Works administration—was in liquidation with the pectation that its career would be terminated by Jan. 1, 19 except for a few projects already begun but which could not completed because of wartime shortages of necessary materials

Programming of local public works for post-war execution, gun in 1941, was terminated July 20, 1942, for budgetary reaso (*See* also NATIONAL HOUSING AGENCY.) (P. B. F.)

Federated Malay States.

One of the three principal ministrative divisions of B ish Malaya, the others being the Straits Settlements and the U federated Malay States (*qq.v.*). There are four of these sta Perak, Selangor, Negri Sembilan and Pahang, of which the fi three are on the west coast of the Malay peninsula, while Paha is on the east coast. Area, 27,540 sq.mi.; pop. (est. 1941) 2,21 052, divided as follows: Perak, 992,691; Selangor, 70,552; Ne Sembilan, 296,009; Pahang, 221,800. Racially the populatio divided as follows: Europeans, 11,149; Eurasians, 5,286; Mala 722,626; Chinese, 989,635; Indians, 466,056; others, 17,300.

Ordinarily, the nominal ruler of each state is a native sul who receives political advice from a British resident, himself s ject to the instructions of the high commissioner, who is a governor of the Straits Settlements. Up to the time of the J anese invasion in Jan. and Feb. 1942, this joint office was h by Sir Thomas Shenton Whitelegge Thomas (appointed in 193 The sultans remained in their native states and presumably ca to terms with the Japanese.

Education.—Expenditure on education in 1940 was £437, sterling. There were 35 English schools for boys (13,564 pup and 14 English schools for girls (5,941 pupils). There were Malay schools (63,638 pupils) and 572 Chinese schools (58, pupils). There were 580 schools in Tamil (an Indian languag with 23,527 pupils.

Finance.—Revenue in 1940 was £11,493,060, expenditure

£9,166,303. Public debt at the end of 1940 was £9,950,000.

Agriculture and Mineral Production.—Rubber and tin are he most important products of Malaya. There were 1,699,459 ac. nder rubber cultivation in 1940, 251,960 ac. in coco-nut groves, 186,310 in rice-paddies, 40,629 ac. of oil-bearing palms. Mineral roduction in that year was as follows: tin 35,689 tons; gold 31,633 oz.; tungsten 90 tons; coal 781,508 tons. There were 0,145 miners.

ederation of Labor, American: *see* AMERICAN FEDERAION OF LABOR.

eiler, Arthur (1879–1942), U.S. economist, born in Breslau, Germany, took his Ph.D. at Heidelberg niversity and taught afterwards at the University of Frankfurt. eiler was a member of the socialization commission of the reich conomic council and of the cartel court, 1920–33. He was economic ditor of the *Frankfurter Zeitung* and in 1932 was made professor f economics in the college of commerce at Koenigsberg university. His anti-nazi views compelled him to flee the reich in 933; he went to the United States, where he became professor f economics at the New School for Social Research at New York ity. He wrote widely on international political, economic and onetary problems. Among his works are *Fascism for Whom?* 1938) in collaboration with Dr. Max Ascoli, and *International ecurity* (1939) with Eduard Beneš and Rushton Coulborn. He ied in Riverdale, N.Y., July 11.

eldspar. Operations in the feldspar industry of the United States were reported to have progressed at a high ate during the first three quarters of 1941, but to have declined n the fourth quarter, but no statistics were available for comarison with the total of 290,763 short tons in 1940. Canadian roduction was 21,455 tons in 1940, 12,907 tons from Ontario and ,548 tons from Quebec; the Ontario output decreased to 11,822 ons in 1941, and that of Quebec increased to 14,218 tons, a total f 26,040 tons. (G. A. RO.)

encing. In 1942 five intercollegiate championships were decided. The Intercollegiate Fencing Association hampionship in three weapons was won by N.Y.U. thereby reaining possession of the I.C.F.A. three-weapon trophy, N.Y.U. laced first in the team épée and sabre while Columbia took rst place in the team foil. Arthur Tauber, individual star of the eet, lost his 1941 épée championship to Robert Harder of Penn tate but took the foil championship in a dramatic finish from harles Steinhardt (1941 champion) of St. John's. Chester utcher of the army won the individual sabre championship.

The National Collegiate A. A. championship was won by Ohio tate university thereby gaining the Yale trophy emblematic of he event. St. John's university of Brooklyn took second and llinois was third. Individual honours were divided between Andre eladrier of St. John's and Byron Krieger of Wayne. The former ook first in the sabre and second in foil and épée whereas the atter was undefeated in his 12 foil bouts. Ben Burtt of Ohio tate captured the épée title.

The Big Ten Conference championship was decided at the Uniersity of Illinois with Illinois winning the title. Chiprin of Illiois captured the foil championship with Lenkoff of Northwestrn taking the épée and Siever of Chicago the sabre titles.

The fourteenth annual Women's Intercollegiate Fencing Assoiation championships were decided on April 10 and 11 with New ersey State Teachers college of Jersey City surprising the field o take the title. Grace Acel successfully defended her individual championship won in 1941.

The Eastern Intercollegiate championships were swept by a sensational Seton Hall college (South Orange) team, which took four team titles and all nine individual places in foil, épée and sabre.

In the national championships, Warren Dow (N.Y.A.C.) took the foil and Henrique Santos (N.Y.A.C.) the épée title. Norman Armitage (Fencers' club) again took the sabre and Helene Mayer (San Francisco Fencers' club) repeated her Women's Foil championship. Miguel A. de Capriles (Salle Santelli) accounted for the three-weapon championship. The New York Athletic club won for itself the national foil, épée, sabre and three-weapon team championships, while the Fencers' club captured the National Women's Foil championship. (H. J. Z.)

Ferrero, Guglielmo (1871–1942), Italian historian and internationally recognized authority on the rise and fall of the Roman empire, was born July 31 in Portici, Italy. In 1922, Ferrero aroused the ire of fascist officials by his attacks on dictatorships and was not permitted to leave Italy until 1930; then he was allowed to accept a professorship in modern history at the University of Geneva. Among his later works are *Unity of the World* (1930), *Life of Caesar* (1933), *Women of the Caesars* (1935), *The Gamble; Bonaparte in Italy, 1796–1797* (1939), *The Reconstruction of Europe* (1941) and *The Principles of Power: The Great Political Crises of History* (1942). See *Encyclopædia Britannica* for a biographical note. He died in Geneva, according to a Berne dispatch of Aug. 4.

Fertilizers. The military operations in North Africa in 1942 for the most part prevented the movement of African phosphate rock to points other than axis-controlled Mediterranean ports and materially affected the flow even to those ports. Operations in the Pacific early in the war interrupted phosphate production on certain islands there, notably Nauru. Whether Japan began production from any of these properties was unknown.

In addition to many cargoes of rock, the United States furnished the United Kingdom large tonnages of concentrated superphosphate in order to conserve all possible cargo space. Russia had adequate resources of phosphates. In 1942, production and consumption of superphosphate in the United States rose to the greatest peak in history, with indications of further increases in 1943. The United Nations had in 1942 far greater resources of phosphates than the axis countries, where the shortage might be of critical importance.

German occupation of France placed most of the European production of potash under axis control. Russia was able to supply its own consumption, and Spain was slowly increasing production. Production of potash in the United States from four large and several smaller operations was sufficient to supply all domestic needs and to furnish Canada, Cuba and other nations of the Americas considerable quantities as well.

The magnitude of the munitions program required the use of all suitable chemical forms of nitrogen for that purpose, with corresponding dislocations in the supplies available for use as fertilizer. However, maximum steel output for war caused peak production of coke and consequently of its useful by-product, sulphate of ammonia. Large tonnages of nitrate of soda continued to be imported from Chile. Many new plants for the fixation of atmospheric nitrogen were in operation and others were nearing completion. The United States crop goals for food, feed and fibre production in 1943 brought about greatly increased requirements for fertilizer nitrogen. To insure its best distribution in the interests of the national economy, all supplies of chemical nitrogen were definitely allocated in the United States by the War Production board. Most, if indeed not all, of the requirements for agriculture were expected to be met.

The use of fertilizer in axis-dominated Europe was carefully controlled and directed. In Britain the strictest government control was exercised over potash and phosphates and nitrogen. In the United States, conservation orders of the War Production board specified the grades of fertilizer that might be manufactured and distributed and prohibited the use of fertilizers containing chemical nitrogen on certain crops not considered essential and on lawns and ornamental plantings. The maximum prices at which fertilizers might be sold were fixed by the Office of Price Administration, generally speaking, at the levels existing in the February–March 1942 period. (*See* also AGRICULTURE.)

(C. J. BR.)

Feuermann, Emanuel (1902–1942), Austrian violoncellist, was born Nov. 22 in Kolomea, Poland. A pupil of Julius Klengel, he made his debut when he was 11 years old with the Vienna Symphony orchestra under Felix Weingärtner (*q.v.*). At 16, he was made professor at the Cologne conservatory and later headed the violoncello department at the Berlin Hochschule, a post he held until Hitler's rise to power. He returned to Vienna for concert work, and his European success brought him an invitation to the United States in 1934. There he appeared with the New York Philharmonic-Symphony orchestra under Bruno Walter and also as soloist with leading U.S. orchestras. In 1938 he applied for his first U.S. citizenship papers. He died in New York city, May 25.

Field, Rachel (1894–1942), U.S. author, was born Sept. 19 in New York city. After attending public schools, she was admitted to Radcliffe college in 1914 as a special student. At Radcliffe she wrote a number of one-act plays which were produced in Little Theatres over the country. She then turned to children's books and in 1929 won the Newbery medal for *Hitty, Her First Hundred Years*. Miss Field's first novel, *Time Out of Mind* (1935), put her on the best-seller list. *All This and Heaven Too* (1938), another best seller, was followed by *And Now Tomorrow* (1942). Among her children's books are *Taxis and Toadstools, Eliza and the Elves* (1926); *The Magic Pawnshop* (1927); *Little Dog, Toby* (1928); *Points East* (1930); *Calico Bush* (1931); and *Hepatica Hawks* (1932). Miss Field died in Los Angeles after an operation, March 15.

Finland. An independent republic of northern Europe. Area, 134,000 sq.mi. (land area, 121,000 sq.mi.), after cession of 13,500 sq.mi. to the U.S.S.R. in 1940. Boundary in 1942 fluctuating but expanded. Pop. (census of 1940) 3,887,217. Capital, Helsinki; pop. (est. Jan. 1, 1939), 304,965. Other principal cities are Turku (74,315); Tampere (76,730); Viipuri (74,247). Language and nationality, 90% Finnish, about 10% Swedish. Religion, Lutheran Christian. President in 1942: Risto Ryti; Prime Minister, J. W. Rangell.

History.—Finland's position among the states of the w stood revolutionized in 1942. Yet, peculiarly, it was the w situation which had changed more than Finland. In the wi war of 1939–40 between Finland and the U.S.S.R. the sympa of the world was overwhelmingly for Finland. But then "Bol vik Russia" seemed to be on the side of the nazi aggressors, had attacked Finland. In the struggle which broke out in J 1941 there was question whether Finland or Russia started shooting; certainly Finland had admitted German troops threatened Leningrad; the essential change was that now Rus Britain and the United States had been thrown into each oth arms. Yet the Finns thought of themselves as fighting only t own age-old conflict with the Russian bear. They maintai their democratic institutions intact; they insisted they w only using the Germans to help them; their war, they thou was a "local war" separate from the clash of the great pow They could not understand the coldness of the Swedes, the enn of the British and the growing antagonism of the United State all people with whom the Finns felt especially friendly.

On the other hand these same states, fighting desperately aga the nazi threat, knew that the Finnish conflict was not jus "local war." Sweden feared far-reaching repercussions from land's expansionist ambitions. Britain and the United States the Germans using Finnish air bases from which to attack t convoys to Russia, and to bomb Murmansk and Archangel; t saw Finnish forces holding thousands of Russian troops in north when they were needed on the southern front. In sh whatever the Finnish attitude, it was obvious that Finland aiding the enemy of the United Nations, and to many that m that Finland was herself an enemy. In Dec. 1941 Great Bri declared war on Finland. Through mounting tension the Un States maintained relations, but closed all Finnish consulate the United States in July 1942, and at the end of Decem stopped the dissemination of Finnish propaganda. The Fin legation in Washington continued to function, but in Decem the United States minister to Helsinki, Arthur Schoenfeld, called home "for consultation." This step may have been fluenced by reports that Finnish officials had participated celebration of Pearl Harbor Day at the Japanese legation in sinki.

Finland's war against Russia was continued through 1942 holding operation, neither nation making any great effort to cha the position. The Finns had conquered Karelia and were atten ing to carry on reconstruction work there. Even the front n of Leningrad remained essentially stable. Reports of Fin troops on the Stalingrad front were repeatedly denied, thoug was admitted Finnish volunteers might be there.

Economic and social conditions in Finland were bad, but proving slowly. The cost of living index, based on 100 for 1939, had reached 164 by June 1942; wage readjustments prescribed on a regular scale to meet mounting costs, and at end of the year the government gave its employees an e month's pay. Trade had declined disastrously and needed imp were maintained chiefly by special credit agreements with Sw and by German shipments of foodstuffs. Twenty-five thou children were sent to Sweden for varying periods, and 4,40 Denmark. This eased the problem of relief within the coun as did the resettling of 232,000 of those evicted from Kareli the winter war; 161,000 were not yet re-established. Pets was rebuilt with prefabricated buildings from Sweden. Food plies were low; no eggs were available for adults and only per month for children, but the harvest permitted an increas general food rations. Great stir was caused by the repor 20,000 deaths among Russian prisoners of war.

On the positive side of the ledger were such items as the over-subscription of a new "Fatherland Loan"; the making of motor fuel from wood, the successful lifting of iron ore from lakes, an unexpectedly high yield from the sales tax, and large ncreases in crops of vegetables, potatoes and fodder. Working bees (the *talkoo*) helped relieve the labour shortage; and wood-chopping became a national sport. Government rewards were given for increased farm production. All schools and colleges were authorized to open in October. And the government announced a new presidential election for Feb. 15, 1943.

Education.—In 1939 there were some 11,200 elementary schools, with 411,000 students and 13,500 teachers; 383 professional schools in 1937 with 20,583 students, 68 middle schools with 8,546 students, and 150 lyceums with 42,034 students. There were five universities, of which that at Helsinki was the largest (enrolment, 6,461 in 1938).

Finance.—The monetary unit is the Finnish markka (=2 U.S. cents approximately; at the last free quotation in 1939, 49 FM=$1). Proposed budget for 1943: Revenues 8,280,995,400 FM, expenditures 8,191,105,900 FM; foreign debt (Sept. 1939), 1,040,000,000 FM; internal debt (Sept. 1939), 2,810,000,000 FM; note circulation (April 1, 1941), 5,720,000,000 FM.

Defense.—Service in the army is compulsory for men between the ages of 17 and 60. Effectives in 1938 numbered 2,012 officers, 1,000 men; in 1941 reports varied between six and nine divisions 90,000–135,000 men). The navy in 1939 had two coast defense vessels of 4,000 tons, seven motor-torpedo boats, three mine layers and five submarines. In 1939 there were three air regiments of three squadrons each.

Trade.—Exports (1938) totalled 8,431,111,000 FM; (1940) ,870,000,000 FM; imports (1938) 8,612,283,000 FM; (1940) ,180,000,000 FM. Major export commodities, with their values in 1940 were as follows: pulp, paper, etc. 950,000,000 FM; timber and wood 1,200,000.000 FM; foods of animal origin 70,000,000 FM; metals and metal goods 200,000,000 FM; hides, skins, etc. 0,000,000 FM; minerals 80,000,000 FM. Major import commodities with values in 1938: metals and metal goods 1,420,500,000 FM; machinery and apparatus 1,120,300,000 FM; minerals 61,100,000 FM; colonial products 585,500,000 FM; oils, fats, waxes 503,300,000 FM; transportation equipment 482,900,000 FM. Great Britain, Germany and the United States were the leading importers of Finnish products, while the same three countries plus Sweden supplied most of Finland's imports.

Communication.—Railways (1938) totalled 3,530 mi. and carried 21,200,000 passengers and 15,710,000 tons of freight in 1937. Buses in operation numbered 2,500 in 1937; 20,300 mi. of main highways were maintained by the state. In 1938 there were 85,456 telephones in operation, 1,593 mi. of telegraph lines, 18 broadcasting stations and 293,790 radio sets.

Agriculture.—The chief crops in 1939, with their yields in short tons, were as follows: oats 879,635; wheat 250,222; barley 11,642; rye 364,861; potatoes 1,715,179. Livestock in 1937: 80,038 horses; 1,925,078 cattle; 1,072,307 sheep; 10,372 goats; 04,164 pigs; 100,356 reindeer; 2,814,960 poultry; 18,374 beehives.

Manufacturing.—In 1937 there were 4,264 establishments which employed 207,506 workers and produced goods valued at 1,076,045,000 FM. The chief products and their values were as follows: wood and paper 9,428,919,000 FM; food and luxuries ,453,956,000 FM; textiles 2,264,267,000 FM; machinery 2,113,-12,000 FM; metal 1,767,424,000 FM; leather and rubber 946,-71,000 FM.

In 1940, after the winter war, there remained to Finland 3,896 ndustrial establishments and 175,622 workers. Total industrial production was valued at 19,915,000,000 FM.

Mineral Production.—Following are the chief mineral products of Finland and their output in 1938: pyrite ores 113,514 tons; pyrites (sulphur content) 48,811 tons; copper ore 15,542 tons; copper 13,483 tons; gold 3,858 oz.; and silver 57,900 oz.

(F. D. S.)

Finucane, Brendan (Paddy)

(1921–1942), Irish aviator and ace of World War II, was at the time of his death the youngest wing commander of the R.A.F. He shot down five German planes during the Battle of Britain in 1940 and was decorated with the Distinguished Flying Cross. He added two bars to his medal in 1941 and before he was 21 was awarded the Distinguished Service Order. Finucane was wounded during a dog-fight between Spitfires and Messerschmitts over the channel in Feb. 1942. After a brief hospital furlough, he returned to service and was promoted to wing commander in June. The following month, while leading a mass formation over occupied France, Finucane was shot down. His death was reported in a London dispatch of July 17.

Fire Insurance: *see* INSURANCE.

Fires and Fire Losses.

The fire loss for 1942, using the statistics furnished by the National Board of Fire Underwriters, was $314,849,000. In 1941 it was $322,357,000, and in 1940 $306,409,000.

In the month of Dec. 1942 the losses were greater than those

THE FRENCH LUXURY LINER "NORMANDIE," renamed the "Lafayette" after its seizure by the U.S. navy for use as an auxiliary transport, burned at her pier in New York city Feb. 9-10, 1942. Listing from water in the hull, the ship finally rolled over on her portside

in any December since 1934. The fact that this substantial increase occurred in the month of December means that probably the pressure on industrial plants was gradually having its effect in an increasing number of fires. You cannot run a plant 24 hours a day without having the machinery affected as it would not be if it were run 8 or even 16 hours a day. There was a fair assumption, therefore, that 1943, purely from these causes, might show an increase in loss.

There was nothing to show any increase in fires from sabotage. Any campaign of sabotage might find a fruitful field in the U.S. industrial set-up when the demand for men is so great that practically anyone who applies may have a job. In World War I, with the exception of the Black Tom disaster, there was no undue fire loss to property because of sabotage; and up to the close of 1942 there was no outstanding fire in World War II comparable to the Black Tom fire. (E. R. H.)

Fish and Wildlife Service.

Wild life conservation in the United States faced during 1942 the grim task of waging a war while maintaining resources of long-time importance. Dr. Ira N. Gabrielson, director of the fish and wildlife service, the national agency in this field, called the fiscal year that ended on June 30, 1942 one of the most difficult in a history which, through parent agencies, extended well back into the 19th century. Still engaged at the year's opening in the task of organizing and co-ordinating the work of a governmental unit established by combining the bureau of biological survey and the bureau of fisheries on June 30, 1940, the service had at the same time to face adjustments required by the national defense program, adjustments which became all the more difficult in the middle of the fiscal year when war itself came to the United States. Soon thereafter the service had to prepare for the transfer of its national headquarters from Washington, D.C., to Chicago, Ill., which took place on Aug. 16 to relieve wartime congestion in the capital. Finally to the perplexities of these problems were added those of retrenchment when congress reduced appropriations for the year beginning July 1.

Nevertheless the service reported not only many contributions to the war but also considerable success in conservation programs and encouragement in the fact that a series of progressive years had placed the resources in good condition to face the hazards that come to peacetime pursuits in time of war. Similar observations can be made with reference to the state game, fish and fur administrations and regarding the experience of such private organizations as the American Wild Life institute, the National Audubon society, the Izaak Walton League of America, the American Nature association and the Outdoor Writers' Association of America, which like other such groups not only continued their activities to promote conservation but also helped in the war effort.

Outstanding war contribution was the work to make the U.S. fish products available for domestic needs despite exports to allies and military demands. Data collected for 1940, the latest available on an annual basis, showed that 125,000 fishermen employed then in waters of the United States and Alaska took 4,056,524,000 lb. of fishery products, worth about $238,000,000 to domestic primary fish handlers and processors. The service applied its fact-finding and experimental facilities to the effort of increasing these products to the prudent maximum. Haddock, cod, shad and salmon being harvested to capacity, fishermen were urged to land minor and less familiar species. The development of farm ponds for fish culture in southern states was encouraged. In connection with the use of fishery products, the service made contributions regarding curing, canning, drying, transporting and storing, assisted military procurement officials, and participated in supplying fish to allies in accordance wi the lend-lease program. So important did this phase of t service's work become that the president in July appointed t secretary of the interior as fisheries co-ordinator, with the direct of the fish and wildlife service as deputy co-ordinator, whereup these activities were continued and intensified by the spec wartime unit thus created.

Predator and rodent control took on an increasing importan Furs became a concern of the armed forces waging war in co climates, and the service rendered assistance illustrated by t appointment of its outstanding fur expert as a consultant of t quartermaster corps' cold climate section. Almost 1,000,000 a of national wild life refuge lands were put to military uses, ar wherever feasible, grazing, hay harvesting, crop production a other economic uses of refuge lands were permitted, thus maki many thousand additional acres available for food production.

The urgency of these activities led to the drastic curtailme of normal operations. Camps of the Civilian Conservation cor for example, which had provided labour for developing wild l refuges, were reduced from 36 to 12 early in the year, and furth curtailments were in process when congress abolished the CC Yet conservation programs as a whole were not abandoned.

Uppermost in the minds of many conservationists during t year 1942 was the need for keeping the wartime public inform of wild life problems, a need that gave added significance to t rapid growth of the Outdoor Writers' Association of Ameri comprising outdoor columnists of the daily press and magazi writers, concerning itself not only with professional matters b also with conservation campaigns. Public response to such ca paigns was indicated by the results of National Wild Life we observed under the sponsorship of the National Wild Life fede tion in April. Outstanding event was the Seventh North Americ Wild Life conference held by the American Wild Life institu in Toronto, Canada, from April 8 to 10, 1942, yet local obse ances of the week took place throughout the United States.

On many occasions during the year conservationists emph sized the importance of outdoor recreation to citizens of a nati at war, pointing out the benefits of sport and also calling atte tion to the fact that game, though valued more for recreati than for meat, did become a part of the U.S. food supply estimated as replacing enough meat annually to feed an ar of 5,000,000 for 77 days. Reports from state game commissio and the fish and wildlife service indicated that there was aga an increased supply of game in the United States, resulting fro the enforcement of strict hunting regulations, the administrati of national refuges totalling 272 with 17,643,915 ac., and t establishment of projects under the program of federal aid the states in wild life restoration. The service's annual wat fowl inventory in Jan. 1942 showed the number of ducks a geese to be about 100,000,000—more than three and one-h times the estimate for 1935. An inventory compilation of da from state and federal agencies showed that big-game numb in the country remained at about 6,000,000. The increasing nu ber of hunters was indicated by the 1941–42 sale of 1,420,2 federal stamps required of all over 16 who hunt waterfowl, compared with 1,260,810 in 1940–41. State reports showed th in the 1940–41 season—the latest represented in compilations there were 7,924,822 persons (an increase of 300,000 over 193 40) paying $14,464,478 for hunting licences. Of statistical a comparative interest during the year was a survey by W. Crouch, chief of the fish and wildlife service's division of ga management, which showed that in the 22 states with availa data there was an increase in wild life funds during World Wa —5% increase from 1916 to 1917, 8% from 1917 to 1918 a 20% from 1918 to 1919. Crouch's study also revealed a warti increase in the number of hunters—1.6% increase from 1916 to 1917, 2.6% from 1917 to 1918 and nearly 30% immediately after the war from 1918 to 1919.

Despite general progress, conservationists continued to point out the dangers of extermination still facing some forms of life. Most emphatic plea of the year was for controlling the take of Lake Huron whitefish, which produced only 114,000 lb. in 1941, or 2.8% of the 1931 catch of 4,140,000 lb. Extermination of this species is imminent, the investigators warned, because of the multiplied use of deep trap nets, which were introduced in 1928.

A notable step toward co-ordinated conservation efforts for all the Great Lakes fisheries was indicated in October in a report by an international board of inquiry of the United States and Canada. Established through the interest of the council of state governments, the board included a chairman from this council and members representing the Canadian Fisheries Research board, the game and fisheries department of Canada, and the U.S. fish and wildlife service. After a two-year study, the board's recommendations called for accurate statistics for each species and each district, common investigations by the governmental agencies concerned, and regulations formulated in accordance with the investigators' findings or, if findings were inconclusive, experimental regulations applied in common and tested for effectiveness. The international character of this inquiry was in accord with a trend begun a quarter of a century ago with the Migratory Bird treaty between the United States and Canada, duplicated in 1937 by a similar treaty between the United States and Mexico and considered as a forerunner of the more extensive though less specific Pan-American conservation commitments in the "Convention on Nature Protection and Wildlife Conservation in the Western Hemisphere," which became effective on May 1, 1942, having then been ratified by seven countries—the United States, Guatemala, Venezuela, El Salvador, Haiti, the Dominican Republic and Peru.

A most impressive book appealing for the preservation of threatened species was published in September by Macmillan. Entitled *Fading Trails,* edited by Charles Elliott, the volume was prepared by a committee of the fish and wildlife service and the national park service under the chairmanship of Daniel B. Beard. Discussing the threatened forms of American wild life, species by species, the volume presented the outstanding current needs in wild life preservation and suggested solutions. Another significant volume of the year, *Remaking America* by Jay Franklin, published by Houghton Mifflin, reviewed the social and economic reforms since 1930 and, as a basis for this, discussed throughout its first half the new national attitude toward natural resources.

The principal source for current and other information on wild life in the United States was the fish and wildlife service, United States department of the interior, Merchandise Mart, Chicago, Ill., which had available lists of federal publications and compilations, among them a list of national, international and state officials and organizations concerned with wild life protection. Private sources of information included the American Wild Life institute, Investment building, Washington, D.C., and the National Audubon society, 1006 Fifth avenue, New York city.

Top federal official concerned primarily with wild life in 1942 continued to be Dr. Ira N. Gabrielson, director of the fish and wildlife service. Charles E. Jackson continued as one of his assistant directors. Albert M. Day in October succeeded the retiring W. C. Henderson as the other assistant director. (*See* also FISHERIES.) (H. Z.)

Fisheries.

The fisheries of the world, according to the tabulation of the U.S. fish and wildlife service, annually yield about 17,500,000 tons of 2,000 lb. each, of food and industrial products, with a value of about $762,000,000. The fisheries conducted in the north Atlantic area by bordering countries produce 7,550,000 tons, valued at $374,000,000; with the production by eastern north Atlantic countries amounting to 6,100,000 tons, valued at $310,000,000, and by western north Atlantic countries to 1,450,000 tons, valued at $64,000,000. In 1942 the catch was below normal because of the difficulty of operating under war conditions. Prices, however, advanced sharply and fishermen received a high return for their catches. The species of importance in the north Atlantic area include herring, cod, haddock, mackerel, halibut, rosefish, swordfish, crabs, shrimp and oysters. In some of the warring countries conservation regulations were relaxed in an effort to increase fish production, without regard to the effect of unrestricted operations on the maintenance of fish supplies in the sea.

As a result of the war, generally, operations by warring nations were considerably curtailed. In Great Britain and the Union of South Africa it was estimated that well over one-half of the fishing fleet was taken over by the admiralty. The remainder found it difficult to conduct fishing on the usual banks. In order to make up for the deficiency of its domestic fisheries, Great Britain looked to other sources for fishery foods. Considerable dependence was placed on supplies of salted, frozen and canned fish from Newfoundland and Canada; salted, fresh and frozen fish from Iceland; and under the lend-lease program of the United States large quantities of canned salmon, sardines, mackerel and sea herring were sent to England from Alaska, California and Maine. Because of difficulties in securing refrigerated cargo space on transports and of holding chilled fish in cold storage in England, the importation of frozen fish was less than normal. A maximum price order was put into effect for most items of fresh and frozen fish, and zoning systems of distribution were established in an attempt to equalize the supply of fish in all sections of the country.

While the situation in many sections of the world was not conducive to normal fishing operations during 1942, many countries took renewed interest in exploiting the fishery resources. For instance, the cessation of imported canned fish in New Zealand caused local fish canners to expand the canning of mullet, kingfish and oysters. The Australian government continued its research program to increase activities likely to promote the production of marine foodstuffs which were urgently needed to replace the former imports of these items. In India the government issued instructions for curing fish. The government of Java, prior to occupation, continued experimental trawling studies to local new fisheries and technical work in fish preserving.

The shrimp fishery on the west coast of Mexico continued to expand and an important shark fishery was developed in this area. Livers from the sharks were exported to the United States where they were used in the manufacture of vitamin A fish-liver oils. However, a reducing plant was to be constructed at Guaymas, Mexico, so that the liver oil could be extracted at that point. Chile conducted a sizable fishery, a considerable portion of the catch being canned and marketed in other South American countries. Emphasis was placed on the development of a shipbuilding industry in Chile, and government assistance was assured for the building of large shipyards at Valparaiso. In Uruguay the government conducted a survey to determine whether local species of fish could support a fish-liver oil industry. It was found that a number of species yielded liver oils having a high vitamin content, and a plant to produce fish-liver oil on a commercial scale was constructed near Montevideo. The government of Venezuela developed a broad program to develop the food industries of the republic and the production of fishery products was increased during the year. However, the extensive fish canning industry of Venezuela was seriously hampered by a scarcity of tin-plate from which to make cans, and steps were taken to provide methods of preserving the catch by means other than canning. The principal method advocated was that of open-air drying. In connection with its program to develop its fishing industry the Argentine government authorized a freezing plant at Mar del Plata which would permit the storage of fish and would provide ice for the preservation of fish on board fishing vessels and while being shipped to distant consumers.

The fisheries of North America, which normally yield over 3,000,000 tons on both coasts and in the interior waters, were prosecuted less extensively in 1942 than in the previous year. The total catch of fishery products in the United States and Alaska was estimated to have totalled less than 1,500,000 tons compared with the record yield of about 2,400,000 tons in 1941. The Newfoundland catch of codfish was the smallest for any year during the 20th century. Declines in the catch were attributed to the requisitioning of fishing vessels by the armed forces, restrictions on the operation of fishing craft, and a shortage of fishermen and shore workers. In Canada fishermen were asked to put forth greater efforts to increase production since a large portion of the catch is sent to Great Britain. The 1942 pack of salmon in British Columbia amounted to about 1,800,000 cases, a decrease of about 450,000 cases, compared with the previous year. However, shipments of canned salmon to Great Britain were increased in 1942: 100% of the pack was sent to the British Isles, while in the previous year only two-thirds was sent across the Atlantic. Large shipments of canned herring were also sent to Great Britain from Canada and requests were received for considerable quantities of frozen cod fillets. On the Atlantic coast of Canada experiments were continued to develop a new type of dehydrated fish products for the warring countries to replace frozen and canned fish.

In Newfoundland the export market for salt cod, which is the main outlet for this product, was very good and no difficulty was experienced in finding buyers for the production, which amounted to about 39,000 tons. However, shipping space was difficult to obtain and stocks of salted cod in Newfoundland near the end of the year were considerably greater than those on the same date in 1941. During 1942 the Newfoundland fishing industry forme a co-operative marketing association and the fisheries boar granted it the sole right to obtain licences for the sale and export o fish to the Spanish market. The major portion of the 1942 production of salted cod was sold to Spanish and Portuguese buyer

The position of the fishing industry in the United States improved materially during 1942, brought about by a higher pric structure. During the year the United States government continued the purchase or charter of fishing vessels for conversio into naval craft, most of which were not replaced, causing serious reduction in the catch in some areas.

Because of the war, sealing operations on the Pribilof Islands i Alaska were greatly curtailed.

The production of canned salmon in Alaska was smaller i 1942 than in the previous year, amounting to about 5,015,00 cases. This was due mainly to war restrictions. Under government orders most of the pack was to be taken for military an lend-lease purposes. The total pack of canned salmon in Nort America (Alaska, British Columbia, Pacific coast states) amounte to 7,525,000 cases in 1942, compared with 10,080,000 cases i 1941. The total pack of canned fishery products in the Unite States and Alaska in 1942 totalled about 650,000,000 lb., compared with 924,000,000 lb. in the previous year. Reduced canning of salmon, sardines (pilchards), tuna and mackerel accounte for the major portion of the decline. Supplies of canned fis available to United States civilians were far below normal because of heavy government purchases of salmon, sardines an mackerel for the armed forces and for lend-lease shipment to th United Nations.

In various countries of South and Central America great interest was shown in exploiting local fishery resources. Attentio was directed mainly toward producing marine products for domestic consumption to replace foods from abroad. In this connection individuals from several South American countries mad investigations of the fisheries in the United States, and under th U.S. government's program for co-operation with other America republics several were assisted in fishery matters. In this connection a mission of fishery experts from the fish and wildli service conducted a survey of the Caribbean fishery resource (*See* also FISH AND WILDLIFE SERVICE.)

IMMOBILIZED FISHING BOATS crowded the harbour of Marseilles in 1942. Lack of gasoline for the boats reduced the production of French fisheries to a fraction of their normal peacetime output

Vitamins.—During 1942 interest was continued by various ountries in securing an adequate supply of fish oils potent in itamins A and D. Canada required that export permits be obained before fish-liver oils or concentrates could be shipped from he country. As a result of the intense commercial interest in itamin A, the fisheries board of Canada investigated the possiility of obtaining vitamin A from whale livers. However, due to he low vitamin content of the samples examined the results were ot encouraging. Manufacturers and importers of vitamin fish ils in the United States continued to exert efforts to augment omestic supplies. The fishery on the Pacific coast for soupfin harks, the liver of which is potent in vitamin A, was prosecuted ntensively. The meat of this shark has been little used commercially. However, a market for dressed soupfin shark was deeloped throughout the Pacific coast states and large quantities ere being landed at attractive prices. In the United States interest also was shown in the extraction of vitamin A and D conentrates from certain low-cost fish oils, without rendering the riginal oil unfit for its normal use in the manufacture of soap, aint and other products. Efforts also were made during the year o locate sources of vitamin-bearing fish oils in other American epublics.

Whaling.—During the two decades from 1920 to 1940 the hale fisheries of the world were prosecuted with renewed vigour. perations were centred almost entirely in the Antarctic. Previusly, little whale fishing was done in this area because of dangerus weather and ice conditions. In recent years, however, such dverse conditions were no obstacle to the staunchly-built factory hips and killer boats. The take was enormous. During the period rom the season 1919–20 (the inception of the fishery on a large cale in the Antarctic) to the 1938–39 season, inclusive, 421,708 hales were captured in this region, from which 32,741,897 bbl. f oil were produced. Due to war conditions complete data were ot available on the production in the Antarctic during the seaons 1939–42. (*See* also OCEANOGRAPHY.) (R. H. F.)

isheries, Bureau of: *see* FISH AND WILDLIFE SERVICE.

iske, Bradley Allen (1854-1942), U.S. naval officer, was born June 13 in Lyons, N.Y. A raduate of Annapolis (1874), he was commissioned an ensign. n 1877, he became interested in a then "infant" science—ericity—and later invented an electric range finder, an electric mmunition hoist, a torpedo-launching instrument and many ther devices widely used on warships. He fought under Dewey t Manila and also served as executive officer on various battlehips. He was promoted to rear admiral in 1911 and was presient of the U.S. Naval institute, 1911–23. A belligerent advoate of naval preparedness, he resigned in 1915 after a quarrel ver the issue with Josephus Daniels, then secretary of the navy. Among his works are an autobiography, *From Midshipman to Rear Admiral* (1919) and several books on naval affairs. He ied in New York city, April 6.

iske, Charles (1868–1942), U.S. bishop, was born March 16 at New Brunswick, N.J. Brought up as Presbyterian, he was confirmed in the Episcopal church in 1890 nd was graduated from the General Theological seminary, New York city, in 1896 and took his D.D. at St. Stephen's college, 1912. He was ordained deacon in 1896, became a priest in the Protestant Episcopal church in 1897, and served as rector in arious eastern churches, 1897–1915. He was consecrated bishop oadjutor of the Central New York diocese in 1915 and was ishop from 1923 until his retirement in 1936. He died in Baltimore, Md., Jan. 8.

Fiske, Harrison Grey (1861–1942), U.S. theatrical producer, was born July 30 in Harrison, N.Y. Fiske, who was dramatic critic and later proprietor of the *New York Dramatic Mirror,* married Minnie Maddern, famous actress, in 1890. He led the battle against the Klaw and Erlanger "theatrical trust," which controlled virtually every theatre of importance throughout the country, and won the support of David Belasco, Sarah Bernhardt and the Shubert brothers in his fight against the stage monopoly. Frequently Fiske productions were staged under tents because the "trust" refused to rent theatres to their "irreconcilable foe." Fiske directed his wife in many of her famous roles and starred her in Ibsen's plays, which he introduced to U.S. audiences. He was the author of several plays, including *The Queen of Liars* and *The Privateer,* and wrote *Fontelle* in collaboration with Mrs. Fiske. After her death in 1932, he retired from stage activities and he died in New York city, Sept. 2.

Fitzpatrick, Sir Charles (1851–1942), Canadian judge and politician, was born Dec. 19 in Quebec. Sir Charles won national prominence as chief counsel for Louis Riel, leader of the rebellion in the Northwest, 1885. Minister of justice, 1901–06, he was made a member of the Imperial Privy Council and its judicial committee in 1908. In the same year, he was appointed a member of The Hague peace tribunal. He was also lieutenant governor of Quebec province, 1918–23 and chief justice of Canada and deputy governor general. He died in Quebec, June 17.

Floods and Flood Control. General flood control legislation provided, up to Jan. 1, 1943, authorizations totalling $930,400,000 for the construction of nearly 500 reservoirs and local flood protection projects widely dispersed throughout the entire United States, exclusive of the large project authorized separately for the alluvial valley of the Mississippi river.

The projects for general flood control were integral parts of comprehensive and co-ordinated plans for the beneficial development of the water resources of the United States, and they provided economic flood protection for a large number of centres of population and for many thousands of acres of rich agricultural lands. Many of the approved reservoirs were suitable for the advantageous development of multiple-purpose projects for flood control in combination with hydro-electric power and other water uses.

Construction work on the federal program for general flood control was begun in 1937, when the first funds for that purpose were appropriated by congress. Up to the end of 1942, 36 reservoirs and 89 local protection projects were placed in operation. During 1942, 41 dams and 105 projects for local flood protection were under construction.

The flood control program was thoroughly co-ordinated with the war effort of the United States. Although all flood control projects, being directly beneficial to the national economy, were directly or indirectly related to the war effort, the only new works initiated in 1942 were seven projects, determined to have direct value for the conduct of the war. Of these, three were multiple-purpose dam and reservoir projects to supply additional power for the war industries; one was a multiple-purpose dam and reservoir project to provide flood protection and increased water supply for an important steel-producing region, and two were local protection projects to give direct flood protection for indus-

THE POTOMAC RIVER reached a flood crest of 17.6 ft. at Washington, D.C., Oct. 17, 1942—a record high. In the background of this picture is the Jefferson memorial; in the foreground, part of a government tourist camp

tries supplying material for the army and navy.

In line with the federal policy of curtailing many activities not essential to the war, all projects which were under way at the beginning of the war emergency were being brought to completion or to a safe point of suspension as rapidly as possible, without interference with work of direct importance to the war, and with due regard to the necessity for protecting lives, the work already accomplished, and the federal investment in that work. In 1942, 17 local protection projects were completed and 14 reservoirs were placed in operation. Steps were taken to suspend construction work on all or parts of numerous other projects. Many of the suspended projects, however, provided substantial amounts of flood protection, even though they would not be fully effective until the construction work was entirely completed. Plans and drawings were being completed for the remaining portions of the suspended projects and for many additional projects not yet initiated in order that actual construction operations on a large s could be undertaken without delay at the end of the war to as in cushioning the inevitable shock of wide-spread unemploym

(J. L. S.

Great Britain.—The work of the catchment boards, subsidi by the government, not only increased the land under cultivat but saved many acres of arable land from flooding. At an offi inquiry dealing with the rivers of Southampton, it was stated t there were at least 20,000 ac. of land in the valleys of the ch streams which could be drained and used for the production foodstuff. Although the river Test, for example, flooded li except at its lower reaches, the bog-land there caused the flo ing of cultivated land and such flooding was increasing yea There were cases of flooding from the tributaries of the Test of other rivers, after heavy rains, which prevented the use many acres. In the valley of the river Hamble good grazing l had become useless owing to the condition of the river. Elsewh so-called water meadows had changed into marshes.

The Somerset Rivers Catchment board was actively engaged schemes covering three valleys, to prevent the extensive wir flooding, which some years previously did considerable dama and also by adequate drainage to bring nearly 100,000 acres land into cultivation.

A drainage scheme was in progress for Ellisland, near Dumfr over an area of about 4,000 acres, which is subjected to flo from the River Nith. It was to be carried out by the governm at a cost of £19,800. It was also proposed to divert the river.

British Guiana.—During 1942 a policy of rural reconstruct to ensure the future welfare of the people of the colony emp sized that the provision and central control of the water wer prerequisite to agricultural development of the coastal lands. scheme to promote the efficiency of use and control of irrigat and flood water was expected to benefit western Demerara, other to provide drainage for areas between the Mahaic (Mahaica) and Berbice rivers.

Sierra-Leone.—In order to increase the area available for a culture, surveys were made of low-lying coastal and inland swa areas, and schemes were in hand for the drainage of considera stretches of such lands in places where the population for wo ing it was immediately available.

Ceylon.—Projects were put forward for a comprehensive dra age and irrigation scheme to prepare for agricultural developm which would convert vast stretches of jungle into homesteads peasants and colonists. (*See* also DAMS; FORESTS; IRRIGATI METEOROLOGY; SOIL EROSION AND SOIL CONSERVATION.

(J. Eu.

Florida.

An extreme southeastern state of the United Sta called the "Peninsula state" because of its pecu outline. Its coast line is greater than that of any other st extending 472 mi. along the Atlantic and 674 mi. along the G of Mexico. Area, 58,560 sq.mi., of which 4,298 sq.mi. are wa surface; pop. (1940) 1,897,414, of which 1,045,791 were ur and 851,623 were rural; 1,384,365 white and 513,049 Negr Only about 60,000 were foreign born. Capital, Tallahassee (240). The larger cities are Jacksonville (173,065), Miami (1 172) and Tampa (108,391).

Florida in the census of 1940 gained an additional represen tive, who was chosen from the state at large in 1942, the s not having been yet redistricted.

The state elective administrative officers, whose terms ex in Jan. 1945, were as follows in 1941: Spessard L. Holland, g ernor; R. A. Gray, secretary of state; J. Thomas Watson, at ney general; J. M. Lee, comptroller; J. Ed. Larson, state tre urer; Colin English, superintendent of public instruction; Nathan Mayo, commissioner of agriculture.

Education.—The biennial report of the state superintendent of public instruction, 1939–40, showed enrolment in the public schools through grade 12 as follows: white, 291,528; Negro, 105,460; total 396,988. There were 2,001 elementary and 828 secondary public schools in the state, with instructional staffs totalling 13,629 teachers, of whom 10,339 taught in the schools for whites and 3,290 in the schools for Negroes.

Public Welfare, Charities, Correction.—Florida appropriated for pensions, benefits and public welfare $16,979,252.88 in 1941–42. From grants by the federal government, the state received in 1941–42, for old-age pensions $3,425,684.76; for dependent children $711,704.38; and for pensions for the blind $262,459.93. Unemployment insurance collected from employers amounted to $6,350,000, from which benefits of $6,302,444.48 were paid out.

Florida has no state penitentiary, but in 1942 maintained a prison farm at Raiford, an Industrial School for Boys at Marianna and an Industrial School for Girls at Ocala. The appropriation for these institutions for 1941–42 carried the sums of $665,394.82, $240,943.17 and $87,587.68 respectively. The state also supported a state hospital for the insane, the Florida Farm colony for the feeble minded and the Florida School for the Deaf and Blind.

Communications.—The total highway mileage in the state in 1941 was 13,378.6 mi., of which 8,000 mi. were paved or hard-surfaced. In 1941–42 disbursements by the state road department, including federal aid, were $14,923,408.86. Florida in 1942 had about 6,000 miles of railroads.

Banking and Finance.—On June 30, 1942, there was a total balance in the treasury of $16,596,235.56. The state is constitutionally forbidden to incur a debt by borrowing except to put down rebellion or repel invasion. The constitution also inhibits the legislature from levying an income tax, and a constitutional amendment forbids the state from laying *ad valorem* tax on real estate. Homesteads are constitutionally exempted from taxation by local taxing units up to the value of $5,000.

On June 30, 1942, there were within the state 52 national banks with deposits amounting to $448,871,000 and 116 state banks and trust companies with deposits of $135,361,000, representing total deposits of $584,232,00, a gain in deposits of $43,050,000 in the fiscal year.

Agriculture.—In 1940 the U.S. Census showed that there were 62,248 farms with a total acreage of 8,337,708 ac., of which 1,751,275 were in crops, 462,248 were idle (fallow), 2,643,065 were in pasture, 1,649,960 were in farm woodland and the rest mainly in fruit.

The citrus production for the season 1941–42 and the estimates for 1942–43 were as follows: oranges (including tangerines) 39,300,000 boxes and 35,600,000 boxes; grapefruit 19,200.000 boxes and 25,000,000 boxes.

Principal Agricultural Products of Florida, 1942 and 1941

Crop	1942	1941
Corn, bu.	7,413,000	7,533,000
Tobacco, lb.	14,288,000	12,125,000
Potatoes, bu.	5,306,000	3,190,000
Sugar cane, short tons	104,700	119,000

On Jan. 1, 1942, the livestock resources of the state were as follows: 920,000 beef cattle, 121,000 milch cows, 553,000 swine, 24,000 sheep, 20,000 horses, 35,000 mules.

Manufacturing.—The more important manufactures of the state in 1942 were lumber, naval stores (turpentine and rosin) and cigars. Shipbuilding had developed considerably in 1941–42.

The cigars manufactured in Florida are valued at around $20,000,000 annually. Tampa and Jacksonville are the leading cities in this industry. Tung oil and the production of paper pulp and the manufacture of paper are also important industries. Florida in 1940 produced 610,796 short tons of paper and paper board from wood pulp.

In 1939 the state had 2,083 manufacturing establishments, paying $37,823,204 to 52,728 workers and producing $241,238,534 worth of goods.

Mineral Production.—Florida has only limited resources in minerals, but has large and rich deposits of phosphates, lime and limestone and less extensive, though highly valuable deposits of kaolin and fuller's earth. The mineral products of the state in 1942 were worth about $13,500,000. (J. M. L.)

Flour and Flour Milling.

In Great Britain the national wheat-meal program, according to the ministry of food's decision of March 23, 1942, temporarily at least, terminated the milling of flour of less than 85% extraction. Following this ruling, stocks of white flour were gradually depleted by allowing bakers to use white flour on a 25% basis up until July 13, after which a 12½% maximum was established.

Canadian millers expressed their willingness to furnish the 85% extraction flour for export, but raised the question of the wisdom of taking up valuable shipping space with bran-containing material when the same tonnage might well be devoted to shorter extraction flour having greater nutritive value and better storaging properties.

In general, there seemed to be some indication that the national wheat-meal bread had not met with the same degree of public acceptance that greeted the enrichment program in the United States. A well co-ordinated program of favourable educational publicity was succeeding in providing the American public with the nutritional facts of the enrichment program. In view of the success of the flour enriching movement there was little reason to believe that a long extraction flour or wheat meal would be considered as a wartime economic measure in the United States.

According to "revised list No. 4" of the Miller's National federation (of Sept. 1942), mills representing more than 65% of the total "family flour" production of the U.S. were pledged to carry on flour enrichment by their voluntary action.

Tremendous reserves of wheat in elevators throughout North America were adequate insurance in 1942 that there would be no shortage of flour in the Americas during 1943. The wheat forecast as of Sept. 1942, compared with 1941, and the preceding 10-year average, was as follows:

	10-year average	1941 crop	1942 crop
Winter wheat	569,417,000 bu.	671,293,000 bu.	697,708,000 bu.
Spring wheat	178,090,000 bu.	274,644,000 bu.	284,085,000 bu.
Durum	27,598,000 bu.	41,800,000 bu.	42,432,000 bu.

In spite of large exports of both wheat and flour, elevator capacity was seriously crowded throughout most of Canada and the United States.

With respect to flour production, the U.S. bureau of the census reported that for the crop year ending June 30, 1942, an average of 1,093 reporting mills produced a total of 104,827,744 bbl. of flour, compared to a production of 105,330,437 bbl. for 1,092 mills reporting for the corresponding period ending in 1941.

Cereal chemistry continued to command an increasingly important position in the milling industry. Basic research related to vitamin assay led to the establishment of control methods which would be fundamental to the control of vitamin content of flours and other cereal products. Outstanding examples of this type of research included: (1) "The Application of the Yeast Fermentation Method for the Determination of Thiamin to the Analysis of Enriched Bread, Enriched Flour and Other Cereal Products"; (2) "Vitamin Analysis in Control Work"; (3) "A Standard Thiochrome Assay for the Determination of Thiamin in Cereal Products"; and (4) "A Comparative Study of Methods for the Estimation of Vitamin B_1." Research chemists specializ-

BAGS OF FLOUR for U.S. warship stores in a depot at the Brooklyn navy yard in 1942

ing in this new and expanding field of biochemistry included: Charles N. Frey, D. J. Hennessey, Lawrence Rosner, Alfred S. Schultz and C. A. Elvehjem.

In the field of physical methods related to the control and study of the physical properties of flour, Dr. C. H. Bailey, director of the experiment station at the University of Minnesota, continued outstanding in the encouragement of this division of flour research. Fluorspar.

Shipments of fluorspar in the U.S. increased from 233,600 short tons in 1940 to 320,700 tons in 1941, while consumption increased from 218,500 tons to 303,600 tons. Imports continued the decline that had been under way after 1937. The normal world production is about 500,000 metric tons, of which the United States supplies one-third, Germany slightly less, with most of the remainder from U.S.S.R., France and Great Britain, but no current data were available from any of these except the United States. (G. A. Ro.)

Fokine, Michel

(1880–1942), U.S. choreographer and ballet master, was born April 26 in St. Petersburg (now Leningrad), Russia. Schooled as a youngster in the traditional ballet technique of the St. Petersburg Imperial theatre, he later rebelled against the traditional postures and sought a more original and natural application of his own dances. He started an "underground" ballet, a revolt movement, to which ma great artists rallied, and developed a modern ballet. In 19 he married a young dancer, Vera Antonova, better known Vera Fokina, who remained as his dance partner throughout career. In 1909, Serge Diaghilev introduced the Fokine dan to Paris and in 1910, Anna Pavlowa introduced his repertoire American audiences. Fokine himself went to the United Sta to stage his ballet creations after World War I and became naturalized citizen in 1932. Among his more famous dance cr tions were *The Dying Swan* (which Pavlowa immortalize *Carnival, Fire Bird, Petrouchkka, Le Coq d'Or, Don Juan, T Elves, Prince Igor, Les Sylphides, Schéhérazade, Cléopâtre, Belle Hélène* and *Blue Beard.* Fokine, who also created the Bal Russe, died in New York city, Aug. 22.

Football.

The navy commissioned nationally famous coach such as Bernie Bierman of Minnesota, Jim Crowl of Fordham, Harvey Harman of Rutgers and Ray (Bear) W of North Carolina to assist in directing the physical fitness p grams for aviation cadets in the pre-flight schools at the u versities of Iowa, North Carolina, Georgia and St. Mar (California).

The army, too, assigned Lt. Col. Robert Neyland, forme of Tennessee, and Major Wallace Wade, coach at Duke, to ta charge of the two Army All-Star elevens which played prof sional clubs in the National Football league for the benefit of t Army Emergency Relief fund. The two teams played a total eight games, of which four were won and four lost, and $24 392.29 were realized for the fund.

There was more football played in 1942 than in 1941. A nu ber of smaller colleges abandoned the game for the duration the war, but there sprang up scores of service teams—arm navy, marine, coast guard and air base elevens.

Of these, the best, aside from the Army All Stars, were t Great Lakes Naval Training team, as in World War I, and Bi man's Iowa Seahawks. The Great Lakes and pre-flight eleve defeated some of the strong college teams, including Minneso Michigan, Alabama, Pennsylvania, Illinois, Iowa, Indiana, M souri and U.C.L.A.

Many problems confronted college football. First of all, as 1917 and 1918, there was a big exodus of players and coach into the armed forces. To fill the gaps in the squads, freshm were made eligible for the varsity in a number of sections. Coac ing staffs were short-handed in many cases. Dimout regulatio curtailed the length of practice sessions under floodlights f teams near the coastline.

Transportation problems arose with the rationing of gas a rubber in the east and, later in the season, with the barring railroad specials to sports events. Teams often had to travel day coaches instead of private pullman cars and take their tu in getting into dining cars. Scouts were unable to use plan adding to the handicaps of undermanned coaching staffs.

Attendance fell off sharply. For the country as a whole, the was a 19% decline. Some colleges, remotely located, suffered 50% drop. Princeton moved three of its games into New Yo and for the first time since the '90s played Yale there, at Colu bia's Baker field.

The Army-Navy classic was ordered transferred to Annapol for the first time since 1893. Instead of the usual crowd 100,000 that annually saw the game at Philadelphia, less th 12,000 attended. By presidential order, only residents within en-mile radius of Annapolis qualified to purchase tickets. The rmy cadet corps was not allowed to attend and the strange sight vas presented of half the midshipman regiment forming an army heering section.

The quality of the football was not as high as usual, but it was xciting football, providing more upsets than any season within nemory and the highest scoring average since 1930. Northvestern, habitually strong, lost nine games. Nebraska was beaten even times. Minnesota, national champion and unbeaten in 1940 nd 1941, lost four games and Duquesne, undefeated since 1939, ost three. Oregon State, which beat Duke in the Rose Bowl, vas humbled five times. Cornell, Texas A. & M., Duke, California, Stanford, Southern California and T.C.U. were other owers that lost three or more games and Notre Dame was eaten twice and tied twice.

Only one team playing a major schedule, Tulsa, came through he regular schedule without defeat. The biggest jolt came on e closing day of the campaign when the two top-ranked teams, oston College and Georgia Tech, were crushed by Holy Cross nd Georgia by scores of 55–12 and 34–0. The same day, Navy Annapolis) overwhelmed heavily favoured Army (West Point) o win by 14–0.

In the final ranking of the teams by the Associated Press poll, hio State was listed at No. 1. Then followed Georgia, Wisconn, Tulsa, Georgia Tech, Notre Dame, Tennessee, Boston college, ichigan and Alabama. The middle west and the south had the rongest teams. The Pacific coast and the southwest failed to ualify for the top ten.

The four southern leaders were all invited to bowl games. eorgia defeated the University of California at Los Angeles U.C.L.A.), 9–0 in the Rose Bowl at Pasadena. Tennessee deated Tulsa in the Sugar Bowl at New Orleans, 14–7. In the range Bowl at Miami, Alabama humbled Boston college, 37–21 nd Georgia Tech lost to Texas in the Cotton Bowl at Dallas, 4–7. The Second Army Air Force defeated Hardin-Simmons in e Sun Bowl at El Paso, 13–7 and the Eastern All Stars defeated e West in the Shrine benefit game at San Francisco, 13–12.

Ohio State won the Western Conference crown. Other sectional hampions were, Southeastern, Georgia; East, Boston college awarded Lambert trophy); Southern, William & Mary; Southestern, Texas; Big Six, Missouri; Missouri Valley, Tulsa; acific Coast, University of California at Los Angeles; Big even, Utah and Colorado tied; Big Three, Yale; Little Three, mherst.

Frank Sinkwich, Georgia back, was awarded the Heisman ophy as the outstanding player of the year. Paul Governali of olumbia was voted second best and won the Maxwell award. he coach of the year was voted to be William Alexander of eorgia Tech.

The record crowd of the season, 95,000, saw Notre Dame and outhern California at Los Angeles. Notre Dame, Michigan, ennsylvania, Ohio State, Southern California, U.C.L.A., Wisnsin, Army, Navy, Georgia and Boston college all played to g crowds and many games were sell-outs.

Professional Football.—In an upset comparable to the rout Boston college by Holy Cross, the Chicago Bears, scourge of e National Football league for three seasons and champions in 940 and 1941, were defeated by the Washington Redskins in e play-off, 14–6.

The Bears had gone unbeaten in 18 successive games and were pected to repeat the drubbing they gave the Redskins in the 940 play-off, a 73–0 debacle, but Sammy Baugh and a powerful e exploded the bubble of their invincibility before a sell-out owd. The Green Bay Packers finished behind the Bears in the estern division and the Pittsburgh Steelers and the New York Giants trailed Washington in the east.

Canada.—Football had a decided military tinge in the dominion, with the R.C.A.F., the army and the royal navy very much in the picture—particularly the flyers.

In the East-West play-off for the Grey cup and the dominion championship, the Toronto R.C.A.F. Hurricanes won the crown by defeating the Winnipeg R.C.A.F. Bombers, 8 to 5 at Toronto before 14,000 spectators. The superior running attack of the home team prevailed over the aerial operations of the western representatives. The Hurricanes had previously won the Eastern Canadian title by defeating the Uplands R.C.A.F. Flyers, stationed near Ottawa, 18–13 before 10,000 at Toronto and had beaten Toronto Balmy Beach for the Ontario Rugby Football Union Crown. The Winnipeg R.C.A.F. Bombers, selected from the three teams in the city league—the Bombers, R.C.A.F. Flyers and the University of Manitoba—were a composite service and civilian team, including R.C.A.F., army and navy men and civilians. They won the Western championship with a 13–6 victory over the Regina Navy.

For a long while it appeared that there would be no play-off for the Grey cup because of the restriction against airmen playing later than Dec. 1. Play in the Western Interprovincial union ended Nov. 7, but the O.R.F.U. carried out a full schedule and declared it impossible to accelerate its schedule enough to meet the Dec. 1 deadline.

The solution was reached when the R.C.A.F. extended the deadline to Dec. 5, the dominion championship was moved ahead to that date from Dec. 12 and the Toronto Hurricanes played three games in eight days to reach the East-West final by Nov. 29. "Sudden death" games were the rule for all championships.

The Winnipeg Bombers won the Grey cup in 1941 and 1939. There was no play-off in 1940 owing to a disagreement over the playing rules. (A. DA.)

Great Britain.—Taking the rugby union game first, four internationals were played, England playing Wales and Scotland both at home and away, and losing them all. As Murrayfield was not available, the Scotland "away" match was played on the equally famous Inverleith ground. The other grounds were Swansea, Gloucester and Wembley (for the return Scotland game). These internationals were, by the way, "services" matches *i.e.* with the teams recruited from members of the army, navy or air force, so that many famous players not in the services, like those who play for the hospitals, were not available.

Cambridge beat Oxford in March this making the fourth successive defeat for Oxford. The Middlesex "sevens" was won by St. Mary's hospital, after a desperate fight in the final with the R.A.F. The R.A.F. had an ample revenge on the army for their defeat earlier in the season, both matches being played at Richmond.

In the rugby league world Dewsbury won the championship, by beating Bradford, and Leeds the Challenge by beating Halifax. In association football, as in rugby, four international matches were played, England against Wales and Scotland, home and away. All the four games were won by the home countries, that at Hampden Park providing a most exciting game with a final score of 5–4. The league war cup final was won by Wolverhampton Wanderers, who beat Sunderland after a replay by 4–1. The London war cup final was won by Brentford, who beat Portsmouth 2–0. In Oct. 1942, England played Scotland at Wembley before a huge crowd that included the king of Norway and Crown Prince Olaf. The match was drawn, with no score. (D. R. G.)

Foreign Exchange: *see* EXCHANGE CONTROL AND EXCHANGE RATES.

Foreign Investments in the United States.

Foreign holdings of United States stocks, bonds, cash balances and other dollar assets, excluding gold, at the end of 1941 were estimated at $9,021,000,000, as compared with $9,791,000,000 a year earlier. The major portion of the decline of more than $750,000,000 in the value of these holdings during the year was directly attributable to circumstances growing out of the war and largely reflected the liquidation of the assets of allied countries.

The invasion of Norway and the Lowlands and the collapse of

France was followed by an abrupt increase in the demand for American supplies, produced a strain on British gold reserves, and necessitated the liquidation of some investments. By the early part of 1941 it was apparent that British gold reserves were practically exhausted and that further payments for current and future deliveries would have to be met by a large-scale liquidation of investments in the United States. For not only was the United Kingdom required to pay dollars for goods and services obtained in the United States, but payment for British purchases in other countries was also frequently required in dollars. In the early months of 1941, after a substantial portion of the mobilized security holdings of its citizens had been sold, plans were made to liquidate the United States subsidiaries and branches (direct investments) of British companies. Transactions of this type presented greater difficulties than the marketing of listed stocks and bonds. The latter were sold on the security exchanges or by special syndicates "off the market." On the other hand, foreign parent company ownership of a direct investment usually involved control of 100% of the voting shares, and consequently such investments had no established market.

The sale of one such investment, the American Viscose corporation, yielded the British a little more than $54,000,000, or about half of its book value. The passage of the Lend-Lease act, in March 1941, eased the burden of payments for future purchases. Nevertheless, large sums were still required to pay for orders placed before the act was passed and for purchases in third countries. In May 1941 the Reconstruction Finance corporation granted a $40,000,000 loan to the Brown and Williamson Tobacco company, another large British-owned subsidiary, of which $25,000,000 was available to the British. The Defense Plant corporation, a subsidiary of the RFC, purchased plants in the United States constructed by the British government before the United States entered the war and thus released about $46,000,000 of additional funds, and in July arrangements were completed for a loan by the RFC of $425,000,000 to the British government collateralled by investments in the U.S. with an appraised value of $700,000,000. At the end of 1941 about $350,000,000 of the loan had been advanced to the United Kingdom; the security for the loan was included in the figure of $1,708,000,000 of British long-term investments in the United States. Largely as a result of the liquidations described above, the value of British investments in the United States declined by about $335,000,000 during 1941. In the course of prosecuting the war, the investments of other allies were also subject to partial liquidation. Canadian holdings at the close of 1941 were $75,000,000 less than at the preceding year-end, Belgian holdings were $38,000,000 less, French holdi were $65,000,000 less, and Netherlands holdings had decli by $54,000,000. A small portion of the decline for all count reflected a decrease of about 17% in the average prices of co mon shares. Common share holdings of all countries decli from $2,056,000,000 at the end of 1940 to $1,658,000,000 a y later. Investments in preferred stocks and bonds were subject proportionately smaller liquidation. The value of total long-t investments on Dec. 31, 1941, was $5,303,000,000, as compa with $5,803,000,000 a year earlier.

The issuance of a series of executive orders in 1940 and 1 immobilizing the assets in the United States of the axis co tries and of those countries overrun by the axis (and the gra ing of licences to friendly and neutral countries to engage financial transactions in the U.S.) served to lessen greatly turnover of certain foreign capital in the United States. Initia the freezing of funds of the victims of aggression was in ef formal notice to the aggressors that any attempt to secure con of the dollar assets of invaded countries or of their natio by duress would be blocked by official action in the United Sta Subsequently, the freezing of axis funds in June and July 1941 the requirement that all foreign assets in the United States registered as of June 1, 1940, and June 14, 1941, laid the b for an effective machinery with which to control foreign fu

Prior to the attack on the United States on Dec. 7, 1 Japan, Germany and Italy—particularly Japan—had redu somewhat their investments in the United States. The mana ment of a number of these was placed in the hands of pers acceptable to the Treasury Department, and a number, products or services of which were not essential, were liquida In March of 1942, the president established the office of Alien Property Custodian, among whose functions were powers to manage, control or vest enemy-owned or -contro businesses operating in the United States. (*See* also Excha Control and Exchange Rates.) (M. Ab

Foreign Missions. The broadening of the area of hos ties in 1942, in World War II, brou added complications to Christian foreign missions. The con between Japan on the one hand and the United States, G Britain and the Netherlands on the other engulfed additi areas in the far east. The consequences were especially felt Dutch and American missions. The Dutch East Indies, m field of the Dutch churches, both Protestant and Roman Cath were overrun by the Japanese, and almost no word made its out from the missionaries fected. Presumably their v was interrupted. From Bu whose Protestant missions v staffed predominantly by Ar icans, all missionaries forced to evacuate. Some fo occupation in India, a fev China and others returnec their native lands. In Thail missionaries, mostly Ameri were interned, and by the of the year several were rep ated. In the Straits Settleme British Malaya and the Br portions of Borneo presum all missionary operations halted. In the Philippi where the overwhelming ma ity of the missionaries

Americans, some were able for a time to continue at their posts, but before the middle of the year almost no news was obtainable from them. In Japan and the portions of China occupied by Japan, most of the American and British missionaries, both Protestant and Roman Catholic, were interned, confined to their own compounds, or, in Shanghai, partly restricted. By autumn, some had been repatriated. Japanese Protestant leaders, with the assistance and perhaps under the direction of their military authorities, were attempting to bring about the kind of union of Protestant churches in some of the portions of China occupied by their forces which had been achieved in Japan in 1941. In the United States missionaries were being appointed and trained against such time as far eastern lands should again be open to them. From the United States, missionaries, both Roman Catholic and Protestant, were being sent in increasing numbers to Latin America.

Forests.

Normal uses for wood were rapidly expanded as the U.S. mobilized for war. Tremendous quantities of lumber were required for barracks and other facilities for the enlarged army. Additional quantities were required for the rapid increase in industrial plant capacity and for housing to care for the workers in the new industrial developments.

Enormously increased requirements for the packaging and crating of food, equipment and supplies both for U.S. armed forces and for lend-lease shipments were one of the largest factors in extending the production problem to the lower grades of lumber. To offset this in part, scientific design and systematic testing at the U.S. Forest Products Laboratory, reduced the amount of lumber required for specific packages. Substantial economies in shipping and storage space were effected at the same time.

The military program included large demands for pontoons which call for high-grade structural timber from the Pacific Northwest. One of the critical factors in the ship-building program proved to be the supply of lumber suitable for decking. No other material was found satisfactory for the purpose.

Shortages of steel, aluminum and other metals caused engineers to turn again to the use of wood for many uses in which it had lost ground in the years preceding the war. Through more extensive use of timber connectors and other devices to permit fabrication of large structural members, wood was playing an indispensable part replacing steel in trusses for bridges, hangars, warehouses and factories. Wood also filled a great need in the construction of mosquito patrol boats, landing barges and small craft of other descriptions. The call for ship-timbers involved a search for oak of suitable size which reached into private residential estates in sections where commercial logging had come to be considered a thing of the past.

Perhaps the most dramatic of the fields in which wood was used was that of aircraft construction. When the available aluminum was found to be insufficient for the unprecedented number of aircraft which would be needed, advances in wood technology enabled wood to meet the need. Through new developments in the field of plastics and in the use of phenol-resin bonding, wood and wood products were given new physical properties which opened up important new uses. Blanks of variable density especially adapted to the manufacture of aeroplane propellers was one of the most interesting. Another was a paper plastic, suitable for use as wing covering.

Plywood proved superior in some respects for fuselage and wing covering. The demand for plywood suitable for aircraft construction stimulated an intensive combing of the northern hardwood forest region to bring out all the available yellow birch of high quality. The price for birch veneer logs was pushed to unprecedented levels.

An increasing scarcity of timber capable of meeting the rigid specifications for aircraft structural members was met by the use of a wider range of species. Inability of the Pacific coast states to supply the necessary quantities of spruce led to an emergency program to draw upon the Sitka spruce forests of Alaska.

In its chemical uses, wood was also rapidly increasing its field of usefulness. Output of domestic wood pulp, stimulated by curtailment of imports from northern Europe, continued at a high level and constituted a major drain upon the forests in some sections.

Pure cellulose, derived from wood, supplied an important part of the raw material entering into the manufacture of explosives. Although wood flour had long been used as a filler in phenol-plastics, an all wood plastic was finding its first large commercial outlet in the replacement of hard rubber for storage battery cases. The scarcity of rubber was also directing attention to wood as a source of alcohol for the making of synthetic rubber.

Shortages of other fuels in the eastern United States and the Pacific Northwest stimulated the use of wood for house heating. Development of a simple wood-burning conversion unit for household furnaces by the Connecticut Agricultural Experiment station opened the way for convenient substitution of wood for oil in the eastern states where the shortage of fuel might remain critical for many years.

Output of lumber, which accounts for about 65% of the cut of all trees of sawtimber size, reached 35,700,000,000 bd.ft. in 1941. While 40% above the 1936–1939 average, this output is no higher than the level which prevailed in the years prior to 1929. Yet, with requirements for 1942 estimated at 39,000,000,000 bd.ft., output fell some 5% below that of 1941. In contrast to the over-all situation, cutting of National Forest timber, which had increased some 70% since 1939 to an all-time high of 2,200,000,000 bd.ft. for the fiscal year ending June 30, 1942, continued at record levels.

Primarily responsible for the decline in lumber output in 1942, were such factors as weather, equipment and labour shortages, transportation problems and financial uncertainty. Yet back of all this, current production difficulties reflected in no small degree, the extent of depletion and deterioration of forests. Tolerance of destructive liquidation in the past meant that there was no longer abundant sawtimber supplies of good quality readily accessible throughout the country. Isolated remnants of timber had to be searched out for specialty uses.

Pressure to supply demands resulted in a wave of destructive cutting sweeping over the second-growth forests of the east and eating further into the old-growth stands of the west.

In addition to supplying critical needs for wood, forests in the United States assumed wartime significance in another way. Protection of forests from fire, ever a problem of first magnitude, was in 1942 a matter of military necessity, essential in national defense.

The danger of sabotage in the forests called for an intensification of protection in all vulnerable areas. For this purpose congress made special appropriations and both federal and state protective agencies adopted special precautions. Thousands of citizens, resident in forested areas, were enlisted and trained for immediate call in a voluntary Forest Fire Fighters service. Simultaneously, the country's forest fire lookout system became an integral and vital part of the army's far-flung air-raid warning system.

(E. H. Cl.)

British Empire.—Empire forestry suffered several losses owing to the Japanese invasion of Malaya, the East Indies and Burma. In Malaya the majority of the members of the forest department were unable to escape. In Burma, with the exception of one or two casualties, the majority escaped to India. In this evacuation sterling work was done by members of the forest department and of the big timber firms.

During the year, under the auspices of the Royal African society, a commission set up to study deforestation and erosion in tropical countries issued its report. It dealt with shifting cultivation, bush fires, grazing, preventive and remedial measures. The commission included representatives of the British, French and Belgian colonies, and of the Netherlands overseas territories. (*See* also LUMBER.) (H. R. BD.)

Formosa

(TAIWAN), Japanese colony, a large island in the western Pacific, separated from China to the west by the Taiwan straits and from the Philippines to the south by the Bashi and Balintang channels. Area, 13,429 sq.mi.; pop. (1938) 5,746,959, of whom 308,845 were Japanese; capital, Taihoku. The governor-general in 1942 was Admiral Seizo Kobayashi. Formosa is valued by the Japanese as a naval outpost, and there is an important base at Mako, in the Pescadores, off the western coast. Formosa served as a take-off point for the Japanese invasion of the Philippines in Dec. 1941.

Education, Trade, Agriculture, Mining, Industries.—In 1937 there were 143 primary schools, with 1,108 teachers and 43,671 pupils for the Japanese and 788 schools, with 7,242 teachers and 445,396 pupils, for the natives. The Japanese yen is the unit of currency, officially valued at 23.48 cents U.S. before the outbreak of the war in the Pacific. The Formosan budget was 183,014,971 yen in 1938–39, 260,530,226 yen in 1939–40. The overseas trade in 1939 was 592,938,000 yen (exports) and 408,650,000 yen (imports). Trade with Japan proper and its territories accounted for 509,745,000 yen of exports and 357,608,000 yen of imports. Formosa is one of the world's largest producers of camphor, and there is a government monopoly of this product. The sugar industry developed notably after the Japanese occupation, the output reaching a record figure of 2,364,570,096 *kin* (the kin is about 1⅓ U.S. pounds) in 1939. Other important products are rice, tea and jute. The island contains gold and iron, although mineral development is not on a large scale. There were 646.3 mi. of government and 316.8 mi. of privately owned railways in Formosa in 1937, besides 1,246.2 mi. of railways designed for the exclusive use of private firms. There were 217 telegraph offices in the island, with 734 mi. of line. There were 2,946 mi. of telephone lines. There were 633,053 savings-bank depositors in the island in 1937, and deposits in savings banks amounted to 27,136,748 yen. (W. H. CH.)

Four-H Clubs.

Goals of the 1,500,000 4-H club members in 1942 were directed toward doing their full share on the wartime needs of the United States. Because of previous training, experienced 4-H club members were able to expand their production activities in 1942 to help meet the nation's Food-for-Freedom goals. Local adult leaders of the clubs, working under the direction of extension agents, devoted additional time and effort to helping newly enrolled boys and girls with similar projects, so the results of the year's work reached a record total. Accomplishment of the 4-H club members in 1942 was estimated to include the raising of 2,000,000 bu. of garden products; production and care of 6,500,000 chickens, 300,000 head of hogs, 85,000 head of dairy cattle; cultivation of 11,000,000 lb. of peanuts, soybeans and other oil producing crops; an the canning of 14,000,000 jars of fruit, vegetables and meat Members also collected 146,000,000 lb. of scrap metal, 23,000,00 lb. of rubber, and 24,000,000 lb. of rags, burlap and paper; an bought $6,000,000 worth of war bonds and stamps, in addition t their regular 4-H activities.

The only national club event held during 1942 was the Nationa 4-H Club congress in Chicago, Ill. Because of wartime cond tions the National 4-H Club camp, usually held in Washingto D.C., was cancelled and the 4-H division of the National Dair exposition was combined with the 4-H Club congress. A Nationa 4-H Mobilization week was observed April 4–11, 1942 to encou age rural boys and girls in making their maximum contributio to the wartime needs of the nation. A National 4-H Achieve ment week, November 7–14, marked the accomplishments o Mobilization week goals.

Volunteer local leaders numbered about 155,000 in 1942. Ther were approximately 79,000 clubs representing practically ever county in the 48 states and in Alaska, Hawaii and Puerto Rico. (M. L. W.)

France

An occupied state situated in the west of Europe bordered N. by Belgium and Luxembourg, N.E. b Germany, E. by Germany and Switzerland, S.E. by Italy, S. b Spain, with the Mediterranean sea on its southeast coast, th Atlantic ocean on the west, and the English channel and th North sea to the north. Area, 212,736 sq.mi.; pop. (est. April 1941) 39,302,511, exclusive of war prisoners; provisional capita Vichy; chief of state in 1942 (since 1940): Marshal Hen Philippe Pétain (*q.v.*). By the armistice of June 22, 194 France was divided into two zones: the occupied and the unoccupied (*c.* 85,000 sq.mi.); the line of demarcation was drawn fro the Swiss frontier near Geneva to a point 12 mi. east of Tou and thence southwest to the Spanish frontier at St. Jean-Pied-d Port. Although the Germans at the end of 1942 occupied th whole of France (save portions of Savoy and the Riviera occupie by the Italians) the line of demarcation was still maintaine Language: French; religion: Roman Catholic; *c.* 1,000,00 Protestants.

History.—The history of France in 1942 was studded b dramatic and tragic events. As the year began, the country wa involved in still another collaborationist crisis. Pétain had a cepted the principle of collaboration in an interview with Hitl at Montoire on Oct. 24, 1940. Nevertheless, he dismissed Pier

THE DISTRESS AND POVERTY of occupied France in 1942 is indicated in th picture of women gathering stray pieces of firewood

Laval, notorious for his eager collaboration, on Dec. 13, 1940. Laval's eventual successor in power was Adm. Jean Darlan, who was appointed on Feb. 11, 1941 vice-premier and the eventual successor of Pétain. Although Darlan in a radio broadcast of May 23, 1941 praised "collaboration" and Hitler's "new order," by 1942 the Germans were evidently not completely satisfied with him. Still, Darlan collaborated sufficiently to be suspected of permitting the Germans to supply Gen. Erwin Rommel through Tunisia, a suspicion which strained Franco-American relations in February, as did also the rumour that Adm. Jean Decoux, high commissioner for French possessions in the Pacific, was turning over French merchant ships for the use of the Japanese. On Feb. o Pres. F. D. Roosevelt sent a personal message to Pétain, and n reply Adm. William D. Leahy, U.S. ambassador at Vichy until May 1, received on Feb. 24 written assurance that France would emain neutral and keep its fleet out of German hands.

At Riom on Feb. 19 began the trial of Edouard Daladier, Leon Blum, Maurice G. Gamelin, and Pierre Jacomet, who had been ontroller general of the army. The first three of these, as well s Paul Reynaud and Georges Mandel, had already been con- emned to life imprisonment by Pétain on Oct. 17, 1941. Al- hough the Germans had expected the trial to hinge upon the issue f war guilt, in reality it revolved about the issue of war pre- aredness. From the Vichy point of view, the trial was a fiasco; proved impossible to keep Marshal Pétain's name from being mplicated in the general responsibility for unpreparedness. The ourt held more than 20 hearings. On April 2, 1942, it adjourned or the Easter vacation, and on April 14 a decree suspended urther hearings.

German discontent, both with the Riom trial and with the rate f collaboration, brought about a crisis which was concluded on pril 18 by Pierre Laval's becoming chief of government. Darlan remained the marshal's designated successor, and became commander in chief of all of the armed forces, but he relinquished l his ministerial portfolios. Laval, who also became minister of oreign affairs, of the interior and of information, was required y constitutional act no. XI to submit his list of ministers to étain for approval and to account to him for all his acts (April 8). The Laval ministry was made up principally of his hench- en, most of them notorious collaborationists. His appointment, hich almost certainly was distasteful to Pétain and Darlan, was ot favourable to the "national revolution" of which Pétain reamed—a sort of pre-1789, Catholic, hierarchical state. Laval, n the contrary, in a broadcast of April 20, spoke of "the new urope, in which socialism will be installed." The year 1942, herefore, was less fertile than 1941 in projects for national re- onstruction, which, in any event, never got beyond the blue- rint stage.

The appointment of Laval was received most unfavourably y the U.S. government. In May there was added tension be- veen Washington and Vichy because of direct negotiations with dm. Georges Robert at Martinique concerning the neutralization f Martinique, Guadeloupe and French Guiana. These negotia- ons, which began on May 9, were conducted by Rear Adm. ohn H. Hoover and Samuel Reber of the U.S. department of tate, and were not finally concluded until Nov. 23. In June and uly there was a somewhat acrimonious exchange of correspond- nce between Vichy and Washington concerning the disposition f the French war vessels interned at Alexandria, which were hreatened at that time with possible capture by Gen. Rommel.

The first fruits of Laval's collaboration were seen in his broadcast of June 22. Having stated that he hoped for German victory because without it bolshevism would be established everywhere, e appealed to French labour to volunteer for work in Germany. The next day the formation of the Tricolour Legion was announced, which was designed to be a larger and official version of the French Volunteers to Fight Bolshevism. To encourage labour volunteering by causing unemployment, 1,300 factories were closed down, and all the resources of official propaganda were used, but without much success. By encouraging volunteering, Vichy hoped not only to placate Germany but also to rid itself of that element of the population which was suspected of being most hostile to the general policies of the government. On Aug. 11 Laval broadcast from Compiègne the announcement that 50,000 war prisoners (out of a total which, it is said, still stood in Aug. 1942 at 1,256,600) would be exchanged for 150,000 volunteer workers. Reports from Berne stated that 160,000 had volunteered for work in Germany up to June 22, 1942, but of these 90,000 had been for a short term and had refused to revolunteer. By the last of August, in spite of heavy pressure, only 45,000 more had volunteered. By this time Laval was trying to secure 350,000, of whom 170,000 were to be skilled metal workers. By a very important decree of Sept. 11 it was provided that all males from 18 to 50 and all unmarried women between 21 and 35 could be obliged to execute any work which the government might judge necessary. This was universally interpreted as legalizing conscription for work in German factories. By Oct. 4 the government began to designate complete groups of workers, ready organized with their foremen, to go to take over German factories. This policy, based upon the law of Sept. 11, occasioned in protest some resignations among high officials of the labour ministry, and was said to have been covertly resisted by some of the employers themselves. As for the workers, although all strikes had been declared illegal, they organized very effective ones, which began at Lyons on Oct. 15 and spread to Marseilles, Toulouse, Tarbes, Annecy, Perigueux, Venissieux, Limoges, Mont-Plaisir, Grenoble, Chambéry and Clermont-Ferrand. Widespread riots occurred on Oct. 16. Faced with this resistance, Laval made several broadcasts, and the government sent its propagandists to lecture to the workers in the factories, but strikes broke out again at the end of the month. In early December it was reported from Switzerland that 100,000 French skilled workers had gone to Germany.

LAVAL CABINET WORKING ON FRANCE'S FUTURE
BISHOP

"WITH A SINGLE-MINDED PURPOSE." The rubber-stamp Laval cabinet of 1942 as characterized by Bishop of the *St. Louis Star-Times*

On Aug. 26, meanwhile, a decree dissolved the permanent bureaus of the senate and the chamber of deputies, thus destroying the last vestiges of the French parliamentary system. Jules Jeanneney and Edouard Herriot, presidents of the senate and chamber of deputies, respectively, had the courage to write a letter of protest to Pétain, in the course of which they said: "It is impossible that liberty will die in the country of its birth, whence it spread over the world. . . ." For this daring Herriot was placed under house arrest.

As the crisis over labour volunteering heightened, apprehensions also increased about the defense of the empire. To the accompaniment of rumours of U.S. troops in the territories surrounding Dakar and of naval concentration at Gibraltar, Adm. Darlan began a tour of the African empire (Oct. 22). On Nov. 8, 1942, it was announced that U.S. and British forces were entering North Africa; landings were made simultaneously in Morocco and Algeria, principally at points near Casablanca, Oran and Algiers. On Nov. 8 Gen. Henri Honoré Giraud, who in April 1942 had escaped from the German fortress of Koenigstein and who was spirited from the unoccupied zone to North Africa just before the allied invasion, broadcast an appeal for all to rally round him "in support of this unexpected opportunity"; on that same day an armistice was concluded at Algiers, and the Vichy cabinet decided to sever relations with the U.S. On Nov. 9, Ambassador Gaston Henry-Haye received his passports, while Mexico and Canada broke off diplomatic relations with Vichy; also on Nov. 9 Laval conferred with Hitler in Munich. On Nov. 10 Oran was captured. On Nov. 11, the Germans began their occupation of the hitherto unoccupied zone, save for the naval base of Toulon, while the Italians began landing troops in Corsica, and took Nice and Chambéry. Pétain uselessly protested the occupation; Gen. Lattre de Tassigny, commander of the military district of Montpellier, tried to resist it, but was disarmed and was held for trial by the state tribunal. In North Africa the original U.S. intention had been to support Gen. Henri Honoré Giraud, but it was discovered that he could not command the allegiance of the Darlan-appointed commandants in North Africa. In consequence, the American command negotiated with Adm. Darlan, who happened to have been captured at Algiers when the invasion c menced, and on Nov. 11, 76 hours after the announcement the fighting had begun, Darlan issued the order to cease fi

So began an extremely confused state of affairs. Darlan clared that he assumed authority in the name of Pétain, wh turn promptly disavowed him. On Nov. 15 Darlan appoi Gen. Giraud commander in chief of all French sea, air and forces in North Africa. Meanwhile, British and Fighting Fr criticism of the arrangement with Darlan mounted, just as agreement caused widespread uneasiness in Russia and am many segments of American public opinion. For Darlan tainted with collaborationism, whereas Gen. Charles de Ga whose movement on June 25 had taken the name of the Figh French, never had been, and was moreover in effective con with the political underground organization in France of resist to the Germans and to collaborationism. On Nov. 17 Pres. Ro velt announced that the arrangement with Darlan was only temporary expedient." By the beginning of December, Darlan organized an imperial council; for a few days he called him chief of state, but later receded from this pretension and tented himself with the title of high commissioner in Fr North and West Africa.

On Dec. 24 Adm. Darlan was assassinated by a 22-year Frenchman whose complete identity had not been divulged the year's end. On Dec. 27 the imperial council appointed as successor Gen. Giraud, but this appointment, warmly welco by all as it was, certainly did not succeed immediately in br ing about the union of all elements of French public opinion cluding Gen. de Gaulle and his adherents. On Dec. 29 Giraud appointed Gen. Alphonse Juin as commander in chie the French armed forces serving under Giraud's authority.

After the Armistice day occupation of all France, few f were divulged in 1942 about events there. Daladier, Blum, naud, Mandel, and Generals Gamelin and Maxime Weygand said to have been taken to Germany. On Nov. 18 Pétain sig constitutional acts XII and XIII, empowering Laval, as chie government, to promulgate laws and decrees under his own si ture, and designating him as next in succession for chief of s

GUTTED RUINS of the Renault tank plant near Paris after the mass raid of British bombers on the night of March 3, 1942

On Nov. 19 Pétain broadcast an appeal to resist "Anglo-Saxon aggression," and on Nov. 20 Laval made a broadcast in which he said that he was sure of German victory.

In a letter to Marshal Pétain delivered on the night of Nov. 26–27, Hitler abrogated the terms of the 1940 armistice, and apparently decreed the disbandment of the French army and navy. At the same moment the Germans occupied Toulon and attempted to seize the French fleet lying there, but the French, commanded by Adm. Jean de la Borde and acting under orders issued in 1940, scuttled their fleet and blew up a substantial part of their coastal batteries and harbour installations. Three submarines escaped and subsequently joined the allies; aerial reconnaissance subsequently proved that about 50 ships at Toulon were permanently disabled or needed very extensive repairs; 15 warships and 5 tankers were afloat but may have been damaged internally. All the larger vessels were scuttled or seriously damaged. A total of about 25,000 tons of ships seemed to be intact, while the tonnage of the scuttled or damaged ships totalled about 95,000.

Throughout 1942 Pétain tried vainly to hold together what was left of the French empire. Early in the year there was great apprehension lest the axis be permitted to use Madagascar as a base. On May 4 the British, with U.S. approval, attacked the northern part of the island and on May 7 Diégo Suarez surrendered. On July 2 the British seized Mayotte Island in the Mozambique channel. On Sept. 10 the British began their second Madagascar campaign, and entered the capital, Tananarive, on Sept. 23. Hostilities ended with the total occupation of Madagascar on Nov. 5; on Dec. 14 the British handed over the administration of the island to the Fighting French. Gen. Paul Louis Legentilhomme became the high commissioner. On Nov. 3 French West Africa, including Dakar (*q.v.*), adhered to the cause of the United Nations. On Nov. 30 Fighting French troops captured the island of Réunion, and finally on Dec. 29 it was announced that French Somaliland, the last remnant of the Vichy empire, had joined the Fighting French and the United Nations.

In 1942 the lot of the Jews in France became ever more difficult, especially after Xavier Vallat was replaced as commissioner for Jewish affairs on May 8 by an even more notorious antisemite, Louis Darquier de Pellepoix. On Aug. 26 there began in the unoccupied zone a roundup of all Jews who had entered France since 1936; they were brutally deported to forced labour in eastern Europe. This policy was vigorously protested by both the Protestants and the Catholics in France, most notably in a letter to Pétain by Marc Boegner, president of the French Protestant federation (Aug. 20), and in a pastoral letter in September by the archbishop of Toulouse. The national council of the Reformed Church in France ordered a protest against Jewish deportations to be read from all pulpits on Oct. 4.

Through the device of collecting costs of occupation at the rate of 400,000,000 fr. (about $3,050,000) a day, a burden twice as heavy as the Versailles reparations was imposed upon a population half as large. Inasmuch as the actual costs of occupation were probably never more than 125,000,000 fr. a day, the Germans were able to buy up French property with the balance, while also maintaining an enormous cash deposit in the Bank of France; on Jan. 15, for example, it stood at 62,325,000,000 fr. Without exactly claiming it as a fact, Vichy had let it be understood that Darlan in his interview with Hitler in May 1941 had secured a reduction of the occupation costs to 300,000,000 fr. a day, but in March 1942, Swiss sources declared that there had been no change, save that France had to pay one-quarter of the daily charge in foreign currencies. Under all these circumstances it was impossible for the Vichy government to prevent disastrous inflation. By June 30, 1942, the Bank of France had advanced to the government 174,938,000,000 fr. for the defrayment of the costs of occupation. During the first six months of the year, armistice expenditures totalled 73,442,000,000 fr. and the total public debt increased about 93,000,000,000. On July 1, 1942, the public debt stood at 968,000,000,000 francs. The statement of the Bank of France for Aug. 27 reported that circulation had attained a new record of 328,239,000,000 fr. In late March the franc was quoted on the black bourse at 200 to the dollar (official rate, 43½), and in November, Swiss black bourses were quoting the French franc at 340 to the dollar.

ANTI-"NEW ORDER" papers had a French underground circulation of about 200,000 weekly in 1942

The budget estimates for 1942 foresaw an income of about 80,000,000,000, an increase over 1941 of 11,800,000,000; and ordinary expenditures of 105,500,000,000 (an increase over 1941 of 8,500,000,000), together with extraordinary expenditures (including a 3,000,000,000 subsidy between the price of wheat and the fixed cost of bread) of 33,000,000,000, a decrease from 1941 of 4,300,000,000 fr. Thus, whereas in 1941 a deficit of 66,000,000,000 had to be met by borrowing, it was anticipated that the deficit in 1942 could be met by borrowing 58,500,000,000. Up to May 31, budget receipts were 35,434,000,000 fr.; expenditures were 121,000,000,000. By June 30 receipts were 42,537,000,000, and by Sept. 1 they had reached 58,839,000,000 fr.

During 1942 French production became ever more dislocated and ever more closely tied to the German economy. Production and employment were made difficult because of the very real shortages of fuel and raw materials. The winter of 1941–42 was extremely cold, and the fall of snow was heavy. It is said that a rather severe drought in late summer cut down the size of the crops. The lack of insecticides, such as copper sulphate, also diminished the harvests. The food supply and the control of black markets were even worse problems than they had been in 1941. The whole French economy suffered grievously, too, from the lack of transport. It was officially estimated that France in 1942 had only 15% of its prewar transportation facilities. (*See* also FRENCH COLONIAL EMPIRE; INTERNATIONAL LAW; WORLD WAR II.)

(A. M. WN.)

France, Free (Fighting France): *see* FRANCE; FRENCH COLONIAL EMPIRE.

Franckenstein, Clemens von

(1875–1942), German composer, was born July 14 in Wiesentheid, Lower Franconia. A student of Ludwig Thuille and Ivan Knorr, he was a conductor at the court opera in Wiesbaden, 1902–07, and later at the Royal opera in Berlin. He was director of the Munich court opera from 1924 until his retirement in 1934. He composed the following operas: *Griseldis* (1898), *Fortunatus* (1909), *Rahab* (1911) and *Des Kaisers Dichter* (*Li-Tai-Pe*) (1920). His death was reported from Berlin, Aug. 22.

Franco, Francisco

(1892–), Spanish soldier and statesman, was born in Galicia. After military service in Morocco, he became a colonel in 1926, and served under the Spanish republic of 1931 in the Balearic Islands, being later transferred to Morocco again. In 1935, he was made chief of staff. On the outbreak of the civil war in June 1936, he flew to Tetuan, in Spanish Morocco, and there organized the transport of Foreign Legionaries and Moorish troops to the Spanish mainland, whither he soon followed. Upon the death of Gen. Sanjurjo, Gen. Franco became military leader of the insurgents. After his victorious conclusion of the civil war in 1939 he added the title of prime minister to the others he possessed, organized his cabinet, and began the task of reconstruction. Franco issued a declaration of "strictest neutrality" at the outset of war in Sept. 1939.

Internal problems continued to dog the *caudillo* throughout 1941 and 1942. The problem of food remained acute, and Franco saw fit in July 1941 to denounce the United States for refusing to ship grain to Spain. Franco signed a decree on Dec. 19, 1941, which proclaimed Spain's nonbelligerent status in the Pacific war.

On Sept. 3, 1942, Franco reshuffled his cabinet, ousted Ramón Serrano Suñer from the foreign ministry and replaced him with Gen. Francisco Gómez de Jordana. Following the entry of U.S. troops into French North Africa, Franco ordered mobilization of several classes of Spaniards on November 17. He affirmed his solidarity with Germany and Italy in a speech on Dec. 8; but he warily refrained from any statements which might compromise Spain's neutrality.

Fredendall, Lloyd R.

(1883–), U.S. army officer, was born Dec. 28 in Wyoming. A cadet at the U.S. Military academy, 1901–02 and 1902–03, he was commissioned a second lieutenant of infantry in 1907. He graduated from the Army Signal school in 1914, took a field officers' course in 1922, graduated from the Command and General Staff school with honours in 1923, and completed studies at the Army War college in 1925. During World War I, he served as General Pershing's staff assistant. From his post as chief of an army corps at Chicago, he went into active duty in 1942. He was chief of the U.S. landing operations at Oran, Algeria, Nov. 8, 1942. There his columns met bitter resistance, but French ground forces holding the key aerodromes were blasted by U.S. air for and finally broke under a mass assault by Fredendall's troo By Nov. 10 Oran's resistance collapsed, and an armistice v concluded.

French Colonial Empire.

Total area (excluding Sy and Lebanon) (appro 4,579,000 sq.mi.; total pop. (est. Dec. 1939) 67,591,000. Cert essential information on the French colonies, protectorates a mandates is given in the table on p. 301.

The U.S. and British invasion of Morocco and Algeria on N 8, 1942, was followed by a proclamation by Admiral Jean Dar on Nov. 13 assuming responsibility for French interests in agr ment with the American authorities and stating "All governors residents must stay at their posts and continue the administrat in conformity with existing laws." On Nov. 17 Darlan, "act for Marshal Pétain," signed a proclamation stating that a cour had been formed to transact all the judicial, legislative and exe tive business of Algeria. President Roosevelt issued a statem the same day to the effect that the agreement with Darlan v only a temporary measure. On Dec. 1 Morocco radio repor that Darlan had assumed the powers of chief of state in Fren Africa and had set up an imperial council. After his assassi tion on Christmas Eve, he was succeeded by Gen. Henri Giraud

French Morocco.—All British subjects, including women a children, were ordered to leave the coast districts by March 1942. Alcohol distilling, oil refining and the production of s copper sulphate, shoes, paper and packing materials were amo new industries. A Société de Coton aimed at developing cot production and building new textile factories, while a freez industry for preserving foodstuffs was under development. T fishing industry was flourishing and expanding.

Algeria.—On April 28, 1942, the Vichy anti-Jewish law Aug. 1, 1941, ordering Jews to live in ghettos, came into for The same month a new railway was opened in southern Alge Several soap factories were reported to be operating and us olive oil as raw material. Distilleries, jam-making and fruit-dry factories were also in operation. The capacity of the textile dustries was enlarged to make use of Algerian wool. An incre was reported in sugar-beet and in coal production.

Tunisia.—Several large textile factories were reported to h been built, and paper, twine and sacks were being manufactu from alfalfa grass. A carbon disulphide factory was in operat north of Kairouan, and lignite mines at El Oudiane and O Douil produced between 12,000 and 15,000 tons monthly, wh was not, however, sufficient to supply the needs of La Goule electric power station and the Tunisian railways.

French West Africa.—A census was ordered to be taken Dakar in Sept. 1942 of all women and children with a view repatriating families with two or more children. On Nov. 3, 1,0 of them left Dakar for France. It was estimated that product of ground-nuts in 1942 would be 200,000 tons. Efforts were ma to develop production of dried fish. On Nov. 23 French W Africa placed itself under the orders of Admiral Darlan. In F ruary the Brong tribe, under King Koadio Adiomani, crossed i the British Gold Coast from the Ivory Coast to join General Gaulle. (*See* also DAKAR.)

French Somaliland.—This colony, with its important ou on the Red sea—Jibuti—joined the Fighting French late in D 1942 and thus became the last Vichy possession to line up w

he Allies. The agreement was signed between M. Dupont, acting overnor of the colony, and the British military commander in thiopia.

French Equatorial Africa and French Cameroons.—The ritish government, by an exchange of letters on March 18, 1942, greed to purchase the 1941–42 produce of French Equatorial frica and the French Cameroons and to facilitate the supply of ssential goods obtainable in the sterling area. The United States nnounced on April 4 its decision to establish an American con-ulate-general at Brazzaville and its recognition of Free French ater renamed Fighting French) effective control of Equatorial frica and the Cameroons. Communications were greatly developed, and the arrival of contingents of U.S. armed forces at razzaville was announced on Sept. 14.

French Pacific Islands.—On March 2, 1942, the United States announced its recognition of the authority of the Free French in the Pacific Islands, and on April 26 the arrival was reported of U.S. troops in New Caledonia. (*See* also Pacific Islands, French.)

Madagascar.—After the British invasion and the surrender of Diégo Suarez on May 7, 1942, a statement was issued on May 14 by the British foreign office that it was intended that the Free French national committee should play its due part in the administration of the liberated territory. Local French officials were reported to be collaborating with the British, who were endeavouring to maintain the French colonial administration. The island of Mayotte was occupied on July 2. A statement issued by the British government in September offered trading facilities, salaries and pensions to civilian and military employees who continued at their posts and guaranteed that Madagascar should remain French. M. Bech, member of the Vichy administration who agreed to act as secretary-general after the retreat of M. Annet, the governor-general, on Sept. 28 called a meeting of the administrative council, an advisory body to the governor, which had not met under the recent dictatorial regime. An armistice was signed on Nov. 5. The Fighting French national committee announced on Nov. 11 that General Legentilhomme had been appointed high commissioner. Madagascar was formally transferred by the British to Fighting France's administration on Dec. 14.

Réunion.—The occupation of the island by de Gaullist troops was announced on Nov. 29, 1942, and on Dec. 1 it was announced that the island had joined Fighting France. (*See* also Lebanon; Syria; World War II.)

French Possessions in America.—These possessions fall into three regional groupings: the small islands of St. Pierre and Miquelon (area, 93 sq.mi.; pop. 4,000) at the mouth of the Gulf of St. Lawrence; French Guiana and Inini (area, *c.* 34,700 sq.mi.; pop. *c.* 36,000) on the east coast of South America to the north of the Amazon river; some half-dozen islands in the Lesser Antilles, the most important of which are Martinique (area, 386 sq.mi.; pop. 241,000) and Guadeloupe (area, 580 sq.mi.; pop. 304,250). The population of the other small islands totalled approx. 23,000 in 1942.

Negotiations were started by the United States with the French governor of the French Caribbean possessions, Admiral Georges Robert, in May 1942, with the idea of permanently eliminating a weak spot in the U.S. Caribbean defense line (a tentative arrangement to preserve a neutral status for the islands had been reached in Dec. 1941). Conversations continued throughout the summer and until after the invasion of North Africa by the Allies; after this event Admiral Robert began acting independently of Laval and Vichy France. Some success was attained; the French war vessels were immobilized by storage of vital parts in the United States consulate and removal of fuel oil, and neutrality of the French West Indies was guaranteed in return. Shipments of nonmilitary supplies were continued so that the islands would not suffer from lack of necessities. The local administration apparently remained at least officially loyal to Vichy, however, and broadcasts late in 1942 were reported unfriendly to the Allied nations. So far as was disclosed, negotiations were unable to release for use 140,000 tons of French merchant shipping and tankers tied up at Martinique. During the summer 300 Martinique French escaped to join Fighting French forces.

The French possessions in America outside the Caribbean area received little mention during 1942. All importation of arms and ammunition at St. Pierre and Miquelon (where a Free [Fighting] French attack was unsuccessfully made in 1941) was forbidden.

Trade.—No statistics for 1942 were available. In 1940 St. Pierre and Miquelon imports were valued at 28,614,000 fr.; exports, 16,475,000 fr. Guadeloupe and Martinique imported from the U.S. in the first eight months of 1941 goods to the value of 3,223,401 fr. and exported to the value of 224,345 fr. French Guiana imports for the same period, $114,894; exports, $20,779.

Resources.—Main French Guiana products are: gold, cabinet woods, cacao, fish glue, rum. St. Pierre and Miquelon are dependent on fishing. The French West Indies produce sugar and rum, vanilla, coffee, bananas and cacao. (D. Rd.)

French Literature.

French literature during 1942 passed through a period of transition and dispersal. The political chaos was mirrored by hesitancy and confusion in the field of letters, and no great new talent emerged. The caesarian division of the country into "occupied" and "unoccupied" zones was both an intellectual and a geographical reality, and the picture of an exile literature, a Vichy-France literature and a Paris literature was maintained until Nov. 11, when Hitler occupied the whole country.

In Paris the return of the famous *Nouvelle Revue Française* to its former editor, Jean Paulhan, was a literary event with encouraging implications. The nazi controlled *N.R.F.* which the invader had sought to impose on French readers under the editorship of the collaborationist Drieu La Rochelle simply was left on the shelves by those for whom it was intended. Paulhan in accepting the editorship, did so only on condition that André Gide and Paul Valéry become once more part of the editorial staff, a condition that was fulfilled.

The Académie Française distributed ten prizes: the literary Grand Prix to Jean Schlumberger for the sum of his works and the Prix du Roman to a newcomer, Jean Blanzat, for his novel *Orage du Matin,* concerning which Mauriac observed that "he would be surprised if this book did not announce a *maître.*" The 1942 Prix Goncourt was awarded to Marc Bernard, former *populiste* writer, for his novel *Pareils à des Enfants.* It was generally conceded, however, that the year was decidedly lacking in original prose works, that 1942 in literary Paris was a year of "eclipse, sleep, even death" (Mauriac); that the year's phenomenon was "the deliverance of poetic forces that had followed the earthquake."

Paul Claudel continued his monumental lifework with the publication of a volume entitled *Présence et Prophétie* by the Editions de la Librairie de l'Université de Fribourg in Switzerland. The aged poet, living in retreat at Brangues, on the Rhône, had been working for more than 20 years on his *apocalypse,* writing his brilliant glosses on Isaiah and Daniel and the Book of Revelations. *Présence et Prophétie* is a sort of preface to the main book still to be published, a book that he announced would be a poet's eschatology, aspiring towards a kind of "verticalism" or "angelism," which would open immense horizons to the future poet.

Across the Mediterranean, *Fontaine,* edited in Algiers by Max Pol Fouchet, created something of a sensation by its vitality and high literary quality. Jules Supervielle, Aragon, Ribemont-Dessaignes, Eluard, Jean Le Louet, Pierre Jean Jouve, Edmond Jaloux, Max Jacob and many others, appeared in this interesting review. Despite distance and exile, Jacques and Raïssa Maritain contributed, from New York, to a special number of *Fontaine* devoted to the subject: "Poetry as a Spiritual Exercise," which was widely read. From nearby Tunisia, Philippe Soupault, who was imprisoned during the summer of 1942, contributed a mo study of his friend, the late James Joyce. This was publishe the "Fontaine Collection" of the Editions Charlot, Algiers, a with volumes by Pierre Jean Jouve, Gertrude Stein, Rainer M Rilke, Pierre Emmanuel, Louis Aragon and many others. In *Cantique à Elsa,* Louis Aragon, the former Surrealist and c munist, who took part in the Battle of France, returned severely classical verse-form.

Among the exile publishing houses, by far the most active the Editions de la Maison Française, in New York city which the end of 1942, had more than 70 volumes to its credit. Am these were to be found such names as Julien Green, Jac Maritain, André Maurois, Jules Romains, Antoine de St. Exup etc. Brentano's, another New York publisher of French bo had a list of more than 50 books, among which were Deni Rougemont's *La Part du Diable* and Jean Schlumberger's *Ja* In the lists of Didier (New York), were books by Jean Pe Edouard Herriot, André Maurois, etc. Also in New York. Surrealist group gathered certain of its scattered forces under leadership of André Breton and published in June 1942, the number of a review entitled *VVV* (triple V). Two exiled Fr writers whose roles in pre-war France were important ones, from a political and a literary standpoint, revived their crea activities in the U.S. under unusual conditions. St. Jean P (*nom-de-plume* of Léger St. Léger, who played a decisive pa French international politics as permanent secretary of For Affairs, with the rank of ambassador) was living in Washing In 1942 he published in *Poetry, A Magazine of Verse,* the poem to come from his pen since he entered politics: "Exil long poem of striking beauty. Julien Green, the U.S.-born n ist writing in French (his *Varouna* appeared in New Yor 1941) revealed himself to be a bilingual writer. He publi during the year his first book written directly in English, *Me ries of Happy Days,* as well as a volume entitled *Charles Pé Basic Verities,* the latter volume in collaboration with his si Anne Green.

In Canada the Editions de l'Arbre (Montreal) published b by Professor Charles Rivet, Jacques Maritain, Mirkine-Gu vitch and others. *La Nouvelle Relève,* the French-Canadia view, published by the same firm, devoted an entire number "Hommage à Maritain," on the occasion of his 60th birth The Edition Quetzal, in Mexico City, published Jules Rom *Mission ou Démission de la France, Le Petit Bois et Autres Co* by Jules Supervielle, *Communion des Forts* by Roger Cai and *L'Orange Bleue* by Yassu Gauclerc. Farther south, in Bu Aires, Sur continued to publish the very excellent review *Le Françaises* (Roger Caillois, editor) as well as individual volu such as *Poèmes de la France Malheureuse,* by Supervielle. In de Janeiro Georges Bernanos completed a new novel, the titl which had not yet been revealed. In Manchester, England, Editions du Calame published a de luxe volume of forty *Le de Proust à Une Amie* and in Switzerland, along with the Frib publications, Albert Béguin published *Les Cahiers du Rhône* poems and essays by such well-known French writers and p as Jean Wahl, Aragon, Jouve, Pierre Emmanuel, etc. (E. Js

Friends, Religious Society of.

The Religious Soc of Friends was in composed of 54 yearly meetings and annual conference gr ith an approximate membership of 163,413, representing 30 ifferent countries. There were 114,405 members in the United tates and Canada and they comprised 29 yearly meetings. Seven f these yearly meetings were associated in the Friends' general onference with headquarters at 1515 Cherry street, Philadelphia. leven of the yearly meetings were associated with the Five ears meeting with headquarters at 101 S. Eighth street, Rich-iond, Ind. The Five Years meeting board of missions conducted chools, hospitals and meetings in Palestine, Africa, Cuba, Mexico nd Jamaica. Oregon and California Friends had mission stations n Bolivia, Honduras, Guatemala and Alaska.

In Europe yearly meetings of Friends were active in Den-ark, Ireland, France, Germany, England, Holland, Norway, weden and Switzerland. China, Japan, India, Syria and Pales-ne, Africa, Australia and New Zealand also had organized meet-gs.

The Friends World Committee for Consultation with head-uarters of its American Section at 20 S. Twelfth street, Phila-elphia, published a directory of the Society of Friends in 1941.

The American Friends Service committee in the United States o-operated with the Friends' Service council in England in recting humanitarian services of relief, child feeding, assistance refugees, social-industrial rehabilitation, peace education and vilian public service.

Projects for Young People.—In 1942 under the peace section, o young people volunteered for work in peace caravans and vilian training units. Some of the young people worked on the osquito control project in Vera Cruz, Mexico. Under the direc-on of the social-industrial section, 138 persons participated in work camps, where they worked eight hours a day and studied e social problems characteristic of their camp location. A spe-al unit was set up to study types of projects and work camps hich would offer to young people an opportunity to help meet e shortage of agricultural labor.

Civilian Defense.—The program of civilian defense encour-ged by Friends sought to sensitize the membership to general nd permanent community services such as new standards of utrition and public health, child care and those forms of social evelopment which, instead of creating a deeper sense of na-onalism, would build the structure and fabric of a new world ommunity. Post-war planning gripped the imagination of the ciety and through the 11 Institutes of International Relations program of fundamental education on the nature of the demo-atic idea was conducted.

Civilian Public Service.—After the outbreak of World War II nd the consequent draft for military purposes the Society of riends in co-operation with other historic peace churches organ-ed civilian public service for conscientious objectors. In 1942 here were 43 camps in which there were 4,000 men. Thirteen f these camps were operated by Friends and in these 13 camps here were 1,050 men, of whom about 30% were Friends. The en in these camps paid $35 a month for maintenance, received salary and worked on projects of a public nature, such as il conservation, reforestation and public health.

War relief operations included the furnishing of a daily supple-entary meal to 84,000 children in Unoccupied France. Milk was urnished for 5,000 babies and clothing and shelter provided for o children in colonies. A Friends' ambulance unit consisting of 5 men operated in China, where their chief function was the stribution of medical supplies.

Refugees and aliens continued to receive assistance, but fol-wing the internment of Japanese in the camps on the west oast, the Service committee served as convenor in bringing gether in the National Japanese-American Student Relocation ouncil the many organizations interested in the resettlement of American-born Japanese students.

The Wider Quaker Fellowship, with offices at 20 S. Twelfth street, Philadelphia, offered to persons who desired a spiritual fellowship with Friends an opportunity to be enrolled. The purpose of this fellowship was to promote the spiritual aims and purposes of the Quakers (Friends), who recognized the divine possibilities in all individuals and sought to give expression to this faith in humanity by sharing in social and spiritual reconstruction. (L. D. Sh.)

Fuel Briquettes.

Although the United States is only a minor producer of fuel briquettes, it was the only country from which data were received. Production increased from 1,050,870 short tons in 1940 to 1,298,606 tons in 1941, with 32 plants in operation. As a result of material shortages, and increased costs of labour and material, 22 plants were closed, some permanently, while others were shifted to war work. (G. A. Ro.)

Fuel Oil: *see* Business Review; Petroleum; Rationing.

Fuller's Earth.

In 1941 the production of fuller's earth in the U.S. broke the decline that had been under way for more than a decade, and increased to 207,446 short tons, 43% over 1940; however, most though not all of this increase was due to the inclusion in the figures of considerable tonnages of Texan material which had not heretofore been classed as fuller's earth. (G. A. Ro.)

Furniture Industry.

The 2,250 factories in the United States manufacturing wooden household furniture set the highest production record in the industry's 150 years of growth during 1942 by producing approximately $1,000,000,000 worth of materials for the public and the government, $620,000,000 of which was furniture for civilian use, a drop of 8% below the 1941 total of $675,000,000, due to conversion of 30% of the industry's production capacity to war work.

Furniture prices during 1942 rose approximately 20% before they were stabilized by price ceilings set by the Office of Price Administration at the March 15 level.

As 1942 drew to a close, 25% of the furniture factories formerly making wooden furniture had been converted about 75% to production of glider wings, PT boat hulls, army trucks and other war supplies while another 25% had been converted 25 to 50% to government work. Not to exceed 10% were fully converted because only the largest units were equipped for such work. By Nov. 1, 1942, 790 plants manufacturing upholstered furniture ceased making davenports and chairs with wire springs. Half of them were waiting at the year's end for some practical substitute, while the other half were producing upholstered furniture with wooden springs or with no springs at all, using hair and cotton padding only. The 200 or so plants manufacturing metal furniture ceased production of that commodity earlier in the year and most of them quickly converted either to wooden furniture or war work.

Warnings of wood shortages worried all household furniture manufacturers at the close of the year. Mahogany was the scarcest wood because of shipping difficulties. Supplies of walnut, an American wood, were plentiful but government requirements threatened to reduce the supply for civilian use to the lowest point in history. Maple, birch, gum and oak also were plentiful but labour shortages in lumber camps began to cut surplus stocks materially. With price ceilings set for all hardwoods, these coming shortages were expected to affect the supply rather than the price of furniture.

During 1942 approximately 50 furniture plants ceased operations or were sold outright for war work to interests outside the furniture field. Furniture markets were continued at Grand Rapids, Mich., Chicago, Ill., New York city, Jamestown, N.Y., High Point, N.C., San Francisco and Los Angeles, Calif., during 1942 but were reduced during the last half year from two (fall and winter) to one, at the request of the government.

The labour situation tightened and skilled workers left many plants for aviation centres, chiefly California. But only 4% fewer employees were on the pay rolls—10% higher than in 1941. Women were being employed in a large number of plants to do light work formerly done by men.

Europe.—Reports from Europe indicated that the furniture industry in England produced 80% war supplies and 20% for civilian use. Lumber shortages were acute, leading to "black markets" for timber. Some furniture was being made from heavy cardboard reinforced with wooden strips and finished like wood. In France, furniture making practically ceased. Germany's 1,000 plants were likewise making war supplies or were idle through lack of man power. Belgium, Italy and Switzerland produced only enough furniture for home consumption, about 25% of their peacetime output. Canada's 110 furniture factories were still operating at high speed to meet the war-boom demand but were being gradually curtailed by priorities and a shortage of labour. (*See* also INTERIOR DECORATION.) (J. A. G.)

Furs. The fur industry of the United States was seriously affected during 1942 by the abnormal conditions arising from the war. The minds of the merchants in the fur trade were confused and filled with uncertainty. As a result there was a steady decline in the values of fur skins. This continued, with minor fluctuations, for the first eight months of the year. Merchandise purchased during the first half of the year failed to move into consumption in expected volume. The decline in market prices brought a considerable loss of capital among skin merchants, dealers and to a lesser extent among manufacturers. The condition was further aggravated by the announcement of the maximum price regulation, fixing March 1942 as the price basis.

The fur trade applied for price regulation that would fit its peculiar needs. Not until July 1942 did the OPA issue a special price regulation applying to the fur trade. This regulation was subsequently amended and was generally considered fair and reasonable. Pending the establishment of this regulation the fur industry came practically to a standstill in April, May and June. By the end of July the fur trade was able to proceed with a fair idea of what the government required from it.

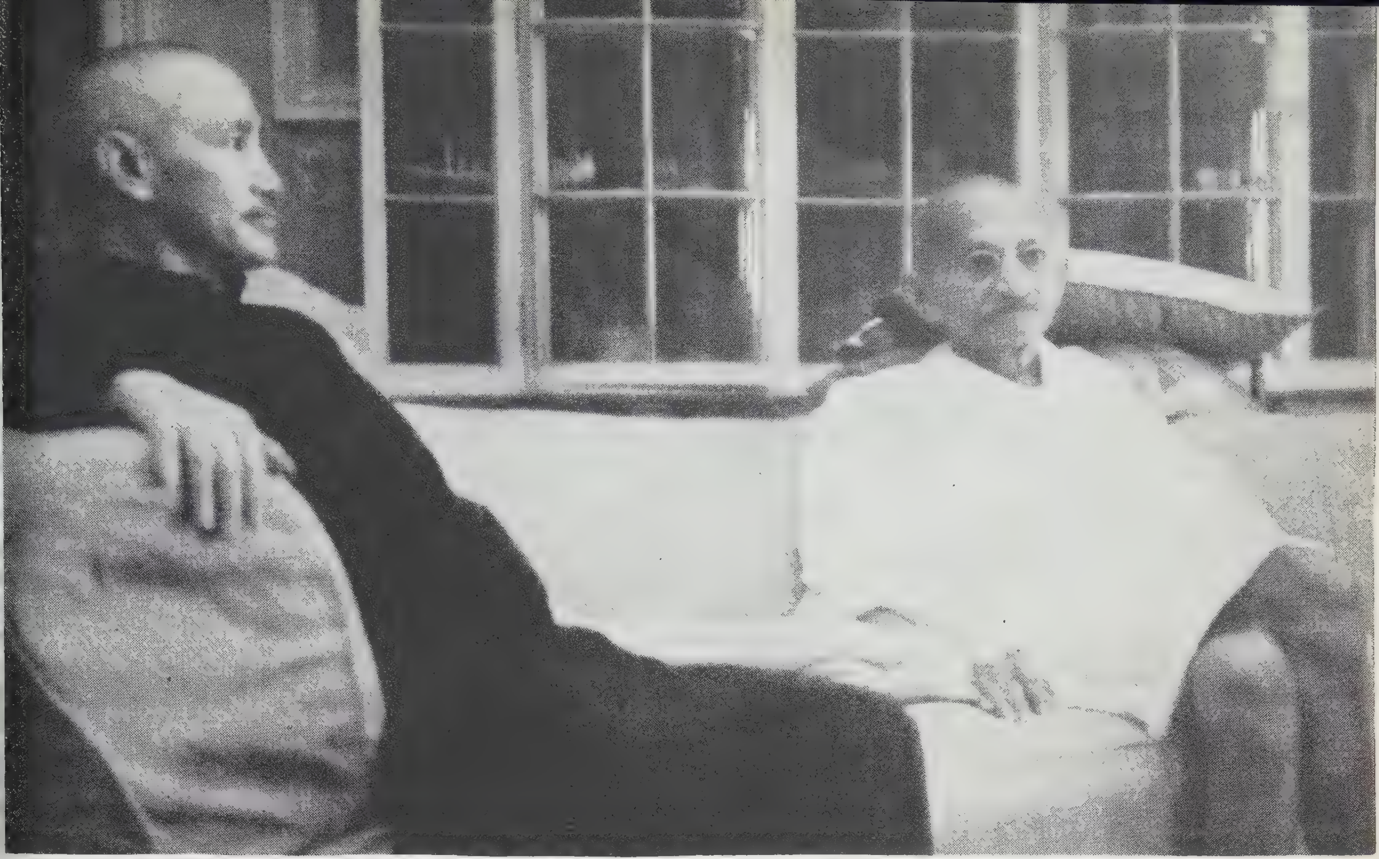
Skin prices, especially on the ranch-bred mink and the ranch-bred silver fox, declined from 25% to 30% compared with corresponding prices in 1941. Many fur farmers went out of business. Low market prices, increased production costs and loss of workers from the farm proved too much for them. Ranch-bred mink coats were sold in the fall at lower prices than ever experienced before for similar qualities. Silver fox garments were equally low in price. Persian lamb skins imported from South-West Africa and Afghanistan to the extent of several million skins reached this market during the 12-month period. The article sold freely but at declining prices. Russian lambskins were in short supply. Muskrat, dyed and blended, was the leading fur of 1942. The United States received imports of various furs from the South American countries, such as ocelot, nutria and spotted cat, fresh shipments of leopard skins from Italian Somaliland Ethiopia, following the conquest of these countries by the All Shipments of furs from Australia, New Zealand and India w greatly reduced. Chinese furs were cut off entirely. The Uni States imported heavily all kinds of furs from Canada. Expo of furs to Canada were curtailed because of war restrictions price control in the dominion. The government did not issue statistics on imports or exports.

Insolvencies for the period Dec. 1941 to Nov. 1942 total about 150 with liabilities of $3,806,952, compared with 83 solvencies in 1941 and liabilities of $1,656,356, according to statistics of the American Fur Merchants association, New Y city.

Consumer demand became very active in the fall and arrival of cold weather quickly depleted retail stocks in Novem and December. Production in the manufacturers market was n capacity during the last quarter of 1942. The revival in consu demand, especially in the war industries areas, quickly deple the rather heavy stocks of skins which had been carried by dealers and merchants for the greater part of the year. S prices improved somewhat and by the end of the year were n or had reached, the maximum price ceilings. Thousands trappers went into the armed forces and into war indust bringing about a noticeable reduction in the size of the wi catch of wild furs. Trappers who remained in the country co only cover part of their traplines because they lacked gasol for travelling and could not obtain new steel traps. This co tion was expected to become more acute in 1943 because government had notified the fur industry that it would gradua deplete it of manpower. This would also affect the produc capacity of the manufacturing end of the trade in 1943.

Worthy of note was the fur vest project, sponsored by War Emergency board of the fur industry. This project, w units in New York and other cities, manufactured and delive up to the end of the year more than 10,000 fur-lined vests the use of the merchant seamen of the Allied Nations. T vests were donated free of cost by the fur industry and International Fur and Leather Workers union. The fur

CONTRIBUTIONS OF OLD FURS to a project for making vests for United tions seamen. About 50,000 members of the Fur Workers union in 1942 e volunteered services of at least ten hours a week to piece together the fur v



IIANG KAI-SHEK and Mohandas Gandhi met for the first time Feb. 18, 1942, Calcutta, where the former journeyed to learn at first hand the extent of dia's war effort and willingness to resist Japanese aggression

ntributed by the fur trade and by the public in the form old fur garments. Distribution was through maritime agencies the east and west coasts. In Nov. 1942 all producing branches the fur industry in the United States convened in New York d formed the National Federation of the Fur Industry, Inc. was planned to co-ordinate the war efforts of all branches of e fur business with those of the United States government and the same time to act as a national body on behalf of the fur ade on matters affecting the welfare and business interests of branches. WA: *see* Federal Works Agency.

ale, Henry Gordon (1874–1942), U.S. physicist, was born Sept. 12 in Aurora, Ill. After ceiving his Ph.D. degree from the University of Chicago in 1899, became assistant in the university's physics department. He vanced to full professor in 1916, serving until his retirement 1940. He was attached to artillery combat with the meteorolog- il service of the signal corps during World War I and was one a group of experts who developed the accuracy of U.S. artillery e by gauging the speed and direction of higher winds. For his rvice with the signal corps, he won a meritorious citation from en. John J. Pershing and promotion to lieutenant colonel. He ent back to the University of Chicago after the war to con- iue his work in physics. He collaborated with Dr. A. A. Michel- n in measuring the speed of light, in testing the rigidity of the rth and in confirming Einstein's theory of relativity by a series tests known as the ether-drift experiments. With Dr. R. A. illikan, he wrote several physics textbooks, now widely used as andard works. Prof. Gale became dean of the Ogden Graduate hool of Science, University of Chicago, 1922, chairman of the ysics department, 1925, and dean of the physical sciences divi- on, 1931.

He died in Chicago, Nov. 16.

ambia: *see* British West Africa.

Gandhi, Mohandas Karamchand (1869–), Hindu nationalist leader, was born at Porbandar (Kathiawar), India. For his biography, see *Encyclopædia Britannica.* On Jan. 22, 1937, Gandhi announced his retirement from active Indian politics, but by 1940 he was as prominent as ever in Indian affairs of state. The All-India congress on March 20, 1940, delegated to him the direction of negotiations with Great Britain for national independence. On Sept. 17, 1940, the congress committee elected Gandhi its leader. In April 1941 he announced that the congress had temporarily abandoned its aim of independence for India, but he reaffirmed his personal policy of nonviolence. On Dec. 30, 1941, Gandhi resigned from its leadership.

On Feb. 18, 1942, Gandhi conferred with Chiang Kai-shek in Calcutta; to Chiang's warning that passive resistance might not work against the Japanese, Gandhi replied that "God gives me guidance to react to situations as they arise." He conferred with Sir Stafford Cripps on March 27 and later rejected his proposals for post-war independence. On Aug. 9, Gandhi and 200 other Indian leaders were arrested, after the All-India Congress party had approved his proposals for a civil disobedience campaign. (*See* also India.)

Garbett, Cyril Forster: *see* York, Archbishop of.

Garfield, Harry Augustus (1863–1942), U.S. educator and son of President James A. Garfield, was born Oct. 11 in Hiram, Portage county, Ohio. He was graduated from Williams college in 1885, studied at Columbia university's law school and at Oxford. He was admitted to the bar in 1888 and began practice in Cleveland. He was professor of contracts at Western Reserve University Law school, 1891–97, and taught politics at Princeton, 1903–08. He was appointed president of Williams college in 1908, where he established the Institute of Politics. He was chairman of the price-fixing committee of the Food administration during World War I and in Aug. 1917, was named fuel administrator by President Wilson. Garfield retired from the presidency of Williams college in 1933. He died in Williamstown, Mass., Dec. 12.

Garnet: *see* ABRASIVES.

Garratt, Geoffrey Theodore

(1888–1942), British journalist and author, attended Rugby and Oxford and joined the Indian civil service in 1913. He served as an officer with the Indian cavalry in Mesopotamia during World War I and rejoined his civil service post in India after the war. Garratt, who had established a reputation as an authority on Indian affairs, had long urged Britain to give Indian youth equal economic opportunities as one of the measures necessary to solve the Indian problem. He left India in 1923 to join the *Westminster Gazette* as a foreign correspondent. He was later foreign correspondent for the *Manchester Guardian* in Ethiopia in 1936 and in the Russo-Finnish war in 1940. A bitter critic of Chamberlain's appeasement policies, Garratt wrote *Mussolini's Roman Empire* (1938), which enunciated his distrust of the axis and which sold 150,000 copies in England alone. Among his other works are: *An Indian Commentary* (1929), *Life of Lord Brougham* (1935), *The Two Mr. Gladstones* (1936), *Gibraltar and the Mediterranean* and *The Shadow of the Swastika* (1939), and *What Has Happened to Europe* (1940). Garratt, who was a Pioneer corps captain in World War II, died while on active duty, according to a London announcement of May 1.

Garrett, John Work

(1872–1942), U.S. diplomat, was born May 19 in Baltimore. He studied for the foreign service at Princeton and graduated in 1895. He was sent to The Hague as secretary of the legation, 1901–03, and later served as secretary in the Berlin and Rome embassies. He was minister to Venezuela, 1910–11, to Argentina, 1911–14, Holland and Luxembourg, 1917–19, and ambassador to Italy, 1929–33. During World War I, Garrett was assigned by the state department as special agent to assist the U.S. ambassador to Paris. There he took over the tasks of aiding stranded Americans abroad, and of welfare work among civilian prisoners of war in France. He died at his home in a Baltimore suburb, June 26.

Gas, Natural.

The total production of natural gas in the United States in 1941 was estimated at 3,800,000,000,000 cu.ft.; after deducting losses and amounts pumped back into the ground for either storage or repressuring the field (usually 18–20% and 5–10% respectively of the total), the marketed total amounted to 2,770,000,000,000, an increase of 4% over 1940. The various leading uses took the following percentages of the total: light, fuel and power in the producing field 23%; domestic use 16%; carbon black plants 13%; electric power and public utility plants 7%; petroleum refineries and commercial uses each 5%; the remaining 31% included a wide variety of minor industrial uses and a small amount exported, mainly to Mexico. Natural gas was piped to and sold in the following states, in addition to the 26 states in which it is produced: Alabama, Arizona, District of Columbia, Florida, Georgia, Iowa, Maryland, Minnesota, Nebraska and North Dakota.

In 1941 a total of 2,900,000,000,000 cu.ft. of natural gas was treated for the recovery of natural gasoline vapours, resulting in the production of 2,697,000,000 gal. of natural gasoline.

(G. A. Ro.)

Gasoline: *see* PETROLEUM; RATIONING.

Gaulle, Charles de

(1890–), French soldier and leader of the forces of Fighting France after the armistices of June 22–24, 1940, graduated from St. Cyr military college at Paris shortly before the German invasion of France in 1914. Wounded three times during World War I, he was captured by German troops at Verdun in 1916, but escaped and saw further action on the western front and in the near east. Fore ing the future tactical importance of tanks and combat cars waged a one-man campaign to persuade France to mechanize infantry after 1918, but army officers preferred to place t trust in such measures of immobile defense as the Maginot The first several days of Germany's lightning thrust through gium and the Netherlands in May 1940 proved the correctnes de Gaulle's theories, and he was belatedly made undersecretar war in Reynaud's cabinet. He parted ways with Marshal Péta government when it elected to surrender, and he fled to Lon There on June 23, 1940, he announced formation of the Fre National committee, an expatriate military and political organ tion. Much of French Equatorial Africa, French Oceania, Fre India and Caledonia rallied to de Gaulle's banner despite the that the Vichy government had condemned him to death *in sentia* for treason. After an abortive attempt to capture Da Senegal, with the support of British warships Sept. 23–25, 1 de Gaulle landed troops at Libreville Nov. 9 and within three c had secured all of Gabun.

The year 1941 saw an expansion of de Gaulle's Free Fre movement (as it was called prior to 1942)—geographically by addition of Syria and Lebanon July 12 and St. Pierre Miquelon Dec. 24, militarily by additions to its army and na and politically by formation Sept. 23 of the Free French Nati council. De Gaulle named himself president of the council appointed a regular cabinet. During the Germans' mass execu of French hostages in Oct. 1941 he appealed to the French discontinue violence and to remain inactive for five-min periods instead as a protest against the slayings. In Septem de Gaulle concluded a military and political alliance with U.S.S.R.; in November he secured lend-lease aid from United States; on Dec. 8 he announced that the Free Fre National council was at war with Japan.

During 1942, the French underground factions united accepted de Gaulle's leadership in the struggle against the axis Gaulle was opposed to Washington's approval of Admiral Darlan as ruler of French North Africa, but he refrained f splitting French unity on this issue and on Dec. 6 urged all Fre men opposing Hitler to unite. After Darlan's assassination on 24, de Gaulle paid tribute to Gen. Henri Giraud and on Ja 1943, he disclosed that he had suggested a meeting with the high commissioner of French Africa for a discussion of poli problems.

Gems and Precious Stones.

The United States tained its position as world's leading market for gems, but sources and supplies being restricted by the current of events. Burma, Thailand Indo-China were inaccessible in 1942, and the European cut industry was disorganized. Imports of gem stones into the Un States are shown in the following table.

Imports of Gem Stones into the United States
(Thousands of carats or dollars)

	1940		1941 (9 mo.)	
	Carats	Value	Carats	Val
Diamonds: rough or uncut	227.9	$11,596	124.2	$5,
cut but not set	321.5	22,002	182.7	13,
Emeralds: rough or uncut	14.4	7	..	..
cut but not set	16.1	304	18.5	
Pearls: natural	..	224	..	
cultivated	..	356	..	
Other gem stones: rough or uncut	..	154	..	
cut but not set	..	2,192	..	2,
Imitation or synthetic gems	..	819	..	
Marcasites: real	..	8	..	
imitation	..	18	..	
Total value	..	$37,680	..	$22,

A large variety of semiprecious stones is produced in the Un tates, most of these being various members of the quartz family –agate, jasper, rock crystal, moonstone, rose quartz, etc. Aside rom the quartz varieties, turquoise is the most important, though any others are recovered in small amounts, such as amethyst, arnet, kunzite, lapis lazuli, rhodonite and tourmaline. The only em stone mined in the United States that can really be classed s a precious stone is sapphire, of which 44,640 troy oz. were roduced in Montana in 1941; this material is primarily for inustrial use, but some gem stones are found. The entire domestic em industry is, however, of comparatively minor importance, the otal valuation of crude material being less than $250,000. (*See* lso MINERALOGY.) (G. A. Ro.)

enetics.

Genetics and Biochemistry.—The most important advance of 1942 was the work of Beadle and atum. They assumed that X-raying the fungus Neurospora ight result in mutant strains incapable of synthesizing certain ubstances necessary to growth, which the normal fungus produced n a minimal medium. X-rayed single spore cultures were grown n media enriched with substances normally synthesized by the ungus. Later, subcultures of these strains, grown on minimal edia, showed the presence in some of new mutants incapable of ynthesizing such factors as vitamin B_6 and para-aminobenzoic cid. The method not only made possible the study of gene ction but supplied test strains for the discovery of hitherto unnown vitamins, amino acids or other growth-promoting factors.

Irwin and Cumley demonstrated that species-specific antiens in the bloods of ring-dove, pearlneck-dove and common igeon are transmitted to the hybrids between two of these pecies and may later segregate in backcrosses. Thus protein diferences between species were proved to be inherited in a Menelian pattern.

Genetics and Evolution.—Patterson, Stone, Griffen, Wharton, ainland and Crow presented data on 24 new species and subpecies crosses in the genus *Drosophila,* most of which give parially fertile hybrids. They found a great variety both in the ature and strength of isolating factors leading to speciation. obzhansky and collaborators continued work on genetic variaility in wild populations of *Drosophila pseudo-obscura.* Silow reorted on the inheritance of colour characters in crosses between hree species of cotton. He concluded that some species differnces are adaptive and others purely fortuitous.

Cytogenetics.—By treating salivary gland chromosomes of *rosophila* with sodium hydroxide, Goldschmidt and Kodani preented evidence that these giant chromosomes are each made up f four chromonemata rather than larger numbers, and that the hromonemata are coiled in the visible bands. Piza described ouble spindle attachments in the chromosomes of a Brazilian corpion. Kaufmann concluded that heterochromatin varies qualiatively in its mottling effects. Lindegren and Lindegren found hrough linkage studies on Neurospora that there are locally speific patterns of chromosome and chromatid interference. Swanson howed that after radiation a nonrandom distribution of chroatid breaks occurred in nuclei of Tradescantia pollen tubes. Newombe induced breaks in chromosomes of hyacinth, tulip and radescantia by X-raying. He found that after multiple breaks xchanges occurred most frequently within chromosome arms, ext between arms of the same chromosome, and least often beween chromosomes. Rhoades described a case where an abnormal hromosome in corn was preferentially segregated to the ovule.

Human Genetics.—The year 1942 saw the presentation and subsequent publication of an outstanding symposium on human genetics. Snyder discussed the mutant gene in man, outlining its chromosomal, physiological and genic relations in the individual and its frequencies in populations. Cotterman presented a summary of biometrical methods by which human genetic factors can be accurately studied even from data involving a single generation. Strandskov stressed the value of population genetics in an eventual check of potential health and manpower of a nation. Penrose suggested future advances in human genetics through cooperative work using clinical, chemical, immunological and metrical techniques.

In *New Paths in Genetics* (see *Bibliography*) Haldane presented an up-to-date summary of human genetic research, emphasizing the interrelationships of genetics, biochemistry and embryology. He outlined clearly modern and accurate statistical approaches to a study of inherited human characters and to the mapping of human chromosomes.

T. Patterson and colleagues, "Studies in the Genetics of Drosophila II. Gene Variation and Evolution," University of Texas Publication No. 4228 (July 1942); J. B. S. Haldane, *New Paths in Genetics* (1942); "Symposium on Human Genetics," *American Naturalist* (March–April 1942). (W. P. S.)

Genthe, Arnold

(1869–1942), U.S. photographer, was born January 8 in Berlin, Germany. A student of classical philology, archaeology and philosophy, Genthe received his Ph.D. at Jena university in 1894. The following year, he went to San Francisco as a tutor for a German baron's son, made his home in California and became a naturalized citizen in 1918. He turned professional photographer, and his photographs of the San Francisco fire in 1906 became famous. He was one of the first photographers to break away from the formalized studio photograph and early in his career began to make natural shots of his subjects, playing up the pattern of light and shadow. He took numerous photos of dancers, and his studies of Isadora Duncan appeared in book form in 1929. He wrote his autobiography, *As I Remember,* in 1936. Genthe died in New Milford, Conn., August 9.

Geographical Society, American: *see* AMERICAN GEOGRAPHICAL SOCIETY.

Geography: *see* AMERICAN GEOGRAPHICAL SOCIETY; NATIONAL GEOGRAPHIC SOCIETY.

Geology.

The impact of the war resulted in the cancellation of the annual meetings of most of the geological societies. The intensive search for strategic minerals led to the greatest demand for geologists in history. As a result of the entrance of many teachers and advanced students into the armed forces the number of graduate students in geology in the educational institutions fell off materially.

Important new mineral deposits were discovered and the limits of known deposits extended. However, the discovery of new oil reserves lagged and greater attention was being devoted to secondary recovery practices and to conservation of known U.S. oil resources.

Scientific interpretation of aeroplane photographs by the armed forces as well as by industry called for the services of many geologists well grounded in geomorphology. Some of the applications received attention in Eardley's book *Aerial Photographs: Their Use and Interpretation,* which fills a long-felt need in geology.

General Geology.—The stimulating paper by Croneis entitled *Geology in War and Peace* published by the American

AS MAUNA LOA, famed Hawaiian volcano, burst into new activity April 26, 1942, U.S. army planes dropped bombs in the paths of lava flows to divert them from the city and harbour of Hilo. In the photograph, one bomb is exploding below and to the right of the descending flow. All danger to Hilo was past by May 10

Association of Petroleum Geologists considers the status of this branch of science. The appearance of *Biography of the Earth* by Gamow in 1941 represents a sound treatise written in a style intelligible to the layman. A review of the problem of the origin of limestone caves entitled *Vadose and Phreatic Features* *Limestone Caverns* came from the pen of J. Harlen Bretz.

Geomorphology.—New text books in this field in the Unit States were by Henry Hinds and by Oskar Dietrich von Enge and a new edition of the classic work on the subject by Charl Andrew Cotton, the eminent New Zealand geomorphologist. T latter author's new book entitled *Landscape* is also noteworth

The *Origin of the Carolina Bays* by Douglas Johnson trea exhaustively of these much discussed craters.

Sedimentation.—A report of the conference sponsored the research committee of the American Association of Petroleu Geologists was issued, entitled *Sedimentation,* in November. T publication of *The Oceans* by Harald Ulrik Sverdrup was timel

Two articles by Krumbien attracted attention, namely: "Pri ciples of Sedimentation and the Search for Stratigraphic Trap in *Economic Geology,* and "Criteria for Subsurface Recogniti of Unconformities" in the *Bulletin of the American Associati of Petroleum Geologists.* A report by Atwill in the latter pub cation on the "Progress of Stratigraphic Studies in California" significant in that it emphasizes the applications of sedimentati in exploring for oil and gas.

Regional Geology.—The leading contribution of 1942 in t field was Schuchert's comprehensive work on *Stratigraphy of t* *Eastern and Central United States.*

Mining Geology.—The subject of structural control of d deposition was treated in *Ore Deposits as Related to Structu* *Features,* edited by Newhouse, a comprehensive symposium 65 leading students of the problem. The new book *Econom* *Mineral Deposits* by Alan Mara Bateman promised to be wide accepted as a text and reference work. From the same auth came a thought provoking article published in *Economic Geolo* on "Magmas and Ores."

Petroleum Geology.—"Trends in Petroleum Geology" w discussed by Arville Irving Levorsen in *Economic Geology.* T recognition by petroleum geologists of the need for stimulat of discovery of new reserves of oil and gas was reflected in *Symposium on Petroleum Discovery Methods* published by t American Association of Petroleum Geologists. The Janua 1942 issue of the *Bulletin* of the Association contained an exc lent article with 121 references on the "Problem of Well Sp ing" prepared by a study group of the Houston Geological socie

Important practical aspects of petroleum geology were broug out in the books *Oil Well Drainage* by Herold and *Oil Prope* *Valuation* by Paine.

Hydrology.—The latest and most authoritative work on t subject appeared as a symposium under the title *Hydrolo* edited by Meinzer and prepared by 24 authors under the dir tion of the National Research council.

Engineering Geology.—The development and use of engine ing geology were excellently summarized by Nickell in the *Bulle of the American Association of Petroleum Geologists.*

The rapid increase in interest in the problem of the deterio tion of concrete as a result of reactions between rocks or miner of the aggregate and cement was manifested by the appeara of several articles on the subject during 1941 and 1942. A c tribution by Coombs in the April 1942 issue of the *Ameri* *Journal of Science* was particularly apt in this connection.

Military Geology.—The applications of geology to warf are briefly pointed out by Price and Woodward in the *Bulle of the American Association of Petroleum Geologists* for D 1942.

An exhaustive bibliography on military geology and geogra compiled by the Division of Geology and Geography of National Research council was issued jointly by that organizat and the Geological Society of America, late in 1941. (*See*

Mineralogy; Palaeontology; Seismology.)

(F. M. V. T.; B. H. P.)

George VI (1895–), king of Great Britain and Ireland (see *Encyclopædia Britannica*) and Queen Elizabeth continued during 1942 to keep in close contact with their subjects throughout the country, visiting factories, hospitals and bombed areas, inspecting troops and decorating war heroes. One award of particular interest was the bestowal by the king of the George cross upon the much-bombed island of Malta, shortly after he had accepted the colonelcy-in-chief of the Royal Malta artillery. (*See* Mediterranean, British Possessions in the.)

Many distinguished visitors were received and entertained at Buckingham palace in 1942; on Oct. 24 Eleanor Roosevelt, who had arrived in Britain to gain first-hand knowledge of British women's war activities and to visit U.S. forces in Britain, was welcomed at Paddington station by their majesties, whose guest she was for the first few days of her stay.

Among the customary ceremonial messages exchanged by the king with friendly rulers and statesmen, two were of special significance. One at the end of 1941 to the president of the Lebanese republic sent best wishes for its prosperity and progress, and this message constituted in fact a full recognition by Great Britain of the independence of the Lebanon. An exchange of New Year greetings between the king and President Kalinin of the U.S.S.R., expressing harmony of views in the main problems of the present struggle, marked another step in Anglo-soviet relations.

During 1942 the king nominated for election two new archbishops (*see* Canterbury, Archbishop of, and York, Archbishop of); and on March 28 he broadcast a special message calling the whole nation to prayer on March 29, "to dedicate ourselves anew" to face "the critical months ahead."

The entry into public life of Princess Elizabeth, heiress to the throne, on April 16, her 16th birthday, was marked by a special birthday parade at Windsor castle where she reviewed the Grenadier guards. The king had appointed her colonel of the regiment a few weeks earlier.

Other members of the royal family were also very actively engaged during 1942. The duke of Gloucester made a six months' tour of war areas, and on June 12, after his arrival in India, he broadcast from New Delhi, on behalf of the king-emperor, a message to the Indian people. He returned to Britain on Aug. 6. Until his tragic death on active service on Aug. 25, the king's youngest brother, the duke of Kent (*q.v.*) had for some time devoted himself to the welfare of the troops. His loss was deeply felt not only by the king and other members of the royal family but also by British subjects everywhere.

George II (1890–), king of Greece, was born at Tatoi near Athens on July 20, the eldest son of King Constantine, and succeeded to the throne for the first time in 1922. Deposed March 25, 1924 after a series of uprisings, he spent the next 11 years in exile until his recall by the Greek assembly in 1935. For his biography, see *Encyclopædia Britannica.* On Oct. 28, 1940, the day that Italy began its invasion of Greece through Albania, George assumed command of the army. His popularity increased in proportion to the Greek successes in Albania. On April 23, 1941, when nazi troops approached Athens, George fled with his government to Crete after declaring that the fight would continue. A month later, he was evacuated by a British destroyer, after narrowly escaping capture, and was taken to Cairo. He reached London Sept. 22, 1941 and formed his government-in-exile. In March 1942, he pledged to restore democratic rule in Greece after the war (prior to the nazi invasion, a dictatorship was in power in Greece). He visited President Roosevelt in Washington, June 1942, for conferences to plan aid for Greece.

George, Harold H. (1892–1942), U.S. army air officer, was born September 14 in New York city. A lieutenant in the air corps during World War I, he won the distinguished service cross for downing five German planes. He sailed for duty in the Pacific in April 1941. After Pearl Harbor, he was promoted to brigadier general and was assigned to Gen. MacArthur's forces in the Philippines, where he commanded the U.S. air force during the Philippine campaign. Gen. George was an outstanding figure in the Bataan battles. He started the "bamboo fleet," a squadron of four ancient commercial planes, which flew desperately-needed food and medicine to Bataan from the southern islands. He was expert at concealing grounded planes, and none of his planes on Bataan were ever destroyed on the ground. Gen. George, whose death in a plane accident was reported on April 30, was posthumously awarded the distinguished service medal.

Georgia. A southern state, bounded by South Carolina, North Carolina, Tennessee, Alabama, Florida and the Atlantic ocean; one of the original states of the United States; popularly known as the "Empire State of the South." Area, 58,876 sq.mi. (including 358 sq.mi. of inland water); pop. (1940), 3,123,723; urban, 1,073,808 (34.4%); rural, 2,049,915 (65.6%). Capital, Atlanta, 302,288. The next largest cities are Savannah, 95,996; Augusta, 65,919; Macon, 57,865.

History.—The state legislature was not in session in 1942. The principal political event of the year in Georgia was the Democratic party gubernatorial primary of Sept. 9, in which Attorney-General Ellis G. Arnall successfully challenged the renomination of the incumbent Governor Eugene Talmadge to the first four-year term for a Georgia governor. The popular vote was Arnall, 174,198; Talmadge, 127,488; in Georgia's peculiar unit vote system the final vote was Arnall, 261; Talmadge, 149 (206 votes necessary for nomination). The nomination of Arnall was ratified in the November general election The chief issue was the loss of the accredited rating of Georgia's university system on the charge of political interference by Governor Talmadge. Arnall pledged that he would take the necessary steps to restore the accredited rating.

Other successful candidates were Homer C. Parker, comptroller-general; T. Grady Head, attorney-general; Richard B. Russell, Jr., U.S. senator. Principal state officials for the year 1942 included: Eugene Talmadge, governor; John B. Wilson, secretary of state; Ellis G. Arnall, attorney-general.

ELLIS ARNALL, governor of Georgia. He was elected Nov. 3, 1942, on the Democratic ticket

Education.—The elementary schools of Georgia had an enrolment (1941–42) of 626,053 students and a teaching staff of 16,822 (10,912 white, 5,910 Negro); secondary schools, 141,880 students, 5,957 teachers (5,067 white, 890 Negro).

Public Welfare, Charities, Correction.—Typical figures indicating the extent of the public welfare program are as follows: WPA, average employment per month for the year ending June 30, 1942, 21,908; total expenditures for the year ending June 30, 1942, $16,879,000 on works projects and $655,000 for administrative purposes. Relief: expenditures, 1941, $488,189.11; Jan.–June 1942, $241,260.02. Old-age assistance: June 1942, 66,195 awards amounting to $585,952. Blind pensions: June 1942, 2,033 awards amounting to $23,544.50. Unemployment insurance: Jan. 1939–June 30, 1942, 237,000 persons received a total of $15,026,744. Aid to dependent children: June 1942, 11,529 children aided with a total expenditure of $106,629.

Surplus commodities: for the year ending June 30, 1942, a total of $5,402,103.21 in goods was distributed.

The state prison population as of June 30, 1942, amounted to 6,194. The state's seven eleemosynary institutions had a total expenditure for the year ending June 30, 1942, of $2,232,823.10. There were 28 county almshouses with a population of 740.

Communications.—For the year ending June 30, 1942, there were 99,143 mi. of highways in Georgia (13,224 state, 85,919 county). The department of highways budget appropriations amounted to $18,501,261.95. As of Dec. 31, 1941, steam railways owned 6,242 mi. of road (first main track). Water-borne commerce in Georgia in 1940 amounted to 4,410,797 short tons; in addition, total traffic on the intracoastal waterway (Beaufort to Cumberland sound section) amounted to 501,312 short tons. Airway mileage, 369; number active airports, 39 (including army fields).

Telephones, 283,077 stations (Southern Bell Telephones: 123 exchanges, 258,296 stations; independent: 103 companies, 24,781 stations).

Banking and Finance.—On June 30, 1942, there were 240 state banks with deposits of $219,383,000 (exclusive of interbank deposits); loans, $109,205,000; investments, $49,358,000. There were 50 national banks with $351,044,000 in deposits (exclusive of interbank deposits); loans, $159,333,000; investments, $140,613,000. Total state treasury receipts for the year ending June 30, 1942, amounted to $56,453,937.21 from taxes alone; from all sources (exclusive of federal funds and earnings of agencies), $58,893,568.09. Total budget appropriations for the year ending June 30, 1942: for operations, $48,754,341.26; for debt payments, $8,321,890.93.

Total fixed debt of the state outstanding on June 30, 1942, was $26,266,139.76.

Agriculture.—Total value of Georgia crops in 1942 showed a 45% increase over 1941; $268,475,000 compared with $185,093,000.

Manufacturing.—No census of manufactures had been compiled since the federal census of 1939. There were, in 1939, 3,150 manufacturing establishments in Georgia which produced goods valued at $677,402,657 and paid $132,188,496 in salaries and wages.

Mineral Production.—Total value of mineral production fo 1940 was $16,932,000; 1939, $14,633,361; estimated value fo 1942, over $20,000,000.

Table I.—*Leading Agricultural Products of Georgia, 1942 and 1941*

Crop	1942	1941
Cotton, bales	860,000	624,000
Cottonseed, tons	384,000	278,000
Corn, bushels	39,160,000	42,000,000
Oats, bushels	10,152,000	10,516,000
Tobacco. pounds	59,860,000	55,430,000
Hay, tons	832,000	746,000
Peanuts, pounds	675,000,000	487,500,000
Peaches, bushels	6,177,000	7,100,000

Table II.—*Principal Industries of Georgia, 1939 and 1937*

Industrv	Value of Products	
	1939	1937
Cotton broad woven goods	$131,627,016	$164,173,283
Food and kindred products	39,454,548	*
Cotton yarn and thread	38,200,073	49,929,575
Paper and allied products	24,457,566	*
Meat packing	23,648,314	24,987,606
Fertilizer	19,049,712	21,711,717

*No comparable figures.

Table III.—*Principal Mineral Products of Georgia, 1940 and 1939*

Mineral	Value of Products	
	1940	1939
Stone	$5,034,288	$4,838,623
Raw clay	4,859,826	4,162,127
Clay products (other than pottery and refractories)	2,582,000	2,375,225

Georgia led the U.S. in 1942 in production of ochre, kaolin barytes and fuller's earth. (E. C. Gr.)

German-American Bund.

Late in the year 1941 the attorney general of the U.S. formally named the Bund as "the official spearhead of the nazi fifth column in America." He insisted that the Bund had not been, a announced shortly after Pearl Harbor, disbanded. Proceeding were begun to revoke the naturalization of many members on th ground that they had obtained citizenship with mental reservation when they swore allegiance. Two Bundists, summoned to appea before the federal grand jury in New York which was inquirin into the citizenship issue killed themselves rather than appea for questioning. The citizenship of many was revoked. In June 1942, eight members of the Bund who had gone to Germany t be trained in the arts of sabotage returned. Four landed at Amagansett, on the south shore of Long Island, N.Y., and four lande at Ponte Vedra beach, Florida. They had large sums of America money and a quantity of explosives. They buried the explosive in the sand on the beach, planning to recover them when it wa convenient. They were all arrested through the efforts of th FBI, and tried by court martial in Washington, D.C. The cour found them guilty of conspiring to interfere with the war efforts c the United States. Six of them were sentenced to death and executed and two, who had assisted the prosecution, received sentences of imprisonment for life. They all admitted their guil Gerhard Wilhelm Kunze, head of the Bund, and several other were tried in Hartford, Conn., on the charge of sending militar information to Germany. Kunze fled to Mexico before the tri but was brought back. Dr. Otto Willumeit of Chicago and D Wolfgang Ebell of El Paso, Bund leaders in Illinois and Texa respectively, and Dr. K. E. B. Molzahn, pastor of a Germa Lutheran church in Philadelphia, were among those tried wit Kunze. All but Dr. Molzahn pleaded guilty and the jury convicted the clergyman. He was sentenced to imprisonment for te years. Kunze was sentenced to 15 years in prison and th others received shorter sentences. Kunze and 25 others were lat tried in New York on the charge of refusing to register under th selective service act and with advising others to refuse to registe Twenty-four of them were found guilty and Kunze received an additional sentence of five years in prison to be served consecutivel with the Hartford sentence. (G. W. Do.)

German Literature.

Literature is more inseparably linke with social and political history Germany than is the case in any other country. This was particularly true of the latest period of national socialist totalitaria domination. All authors must be members of the nazi writer association, must submit their books for approval to nazi author ties before they are printed, and must conform strictly to nazi ideology. This situation, together with the fact that virtually all persons were forced into military service or war work, explains why few notable works of literature were being produced in Germany.

It was therefore to the refugees outside the reich that one looked for German literature today. Many of them sought to explain present conditions in Germany. Three of the best of these were: Franz Neumann, *Behemoth, The Structure and Practice of National Socialism;* Sigmund Neumann, *Permanent Revolution;* and René Kraus, *Europe in Revolt.* Paul Hagen, a former German labour leader who retained contact with the underground opposition movement, examined in his very careful and readable book, *Will Germany Crack?,* the forces working against Hitler and the ways in which they might be strengthened. Hermann Rauschning, who was formerly president of the Danzig senate and who later repudiated Hitler, continued his record of interesting conversations with various German personages in *Makers of Destruction.* Heinrich Hauser's *Time Was: Death of a Junker* is a poignant account of the decline and disappearance of the old German Junker class.

Notable among the novels by German refugees were Franz Werfel's *The Song of Bernadette,* a story of Lourdes and its miracles; Ruth Feiner's autobiographical novel, *Young Woman of Europe;* Anna Seghers' *The Seventh Cross,* a stark story of escape from a concentration camp; and Alfred Neumann's dramatic account of the French defeat in 1870 and the Paris Commune in *The Friends of the People.*

BIBLIOGRAPHY.—More than a hundred German war novels were interestingly analyzed and interpreted in William K. Pfeiler's scholarly *War and the German Mind.* For brief reviews of German literature, see *Books Abroad,* a quarterly published by the University of Oklahoma. (S. B. F.)

Germany.

A totalitarian state or dictatorship, known as the "third reich," in central Europe south of the North and Baltic seas and north of the Alps, Italy and the Balkans. Flag, black hooked cross (swastika) in a round white centre on a red background. Capital, Berlin (*q.v.*). Chief cities (1939 census): Berlin (4,332,242); Vienna (1,918,462); Hamburg (1,682,222); Munich (828,325); Cologne (768,426); Leipzig (701,606); Essen (659,871); Dresden (625,174); Breslau (615,006); Frankfurt-on-Main (546,649); Düsseldorf (539,905); Dortmund (537,000). Religion (1933): Protestants 62.7%; Catholics 32.5%; Jews 0.7%; others 4.1%. Reich chancellor and leader (fuehrer), Adolf Hitler (*q.v.*).

Area and Population.—The area of the old reich was 181,742 sq.mi.; population (census of May 17, 1939), 69,622,483. The area of "Greater Germany," prior to the annexations of 1939–42, was 225,199 sq.mi. and the population 79,364,410, including the populations of the following *Länder:* Prussia 41,762,042; Bavaria 8,280,092; Wurttemberg 2,907,168; Mecklenburg 910,828; Baden 2,518,105; Saxony 5,206,863; Thuringia 1,760,597; Hesse 1,469,911; Oldenburg 582,402; Brunswick 599,210; Anhalt 436,215; Lippe 188,600; Hamburg 1,682,222; Schaumburg-Lippe 54,164; Bremen 400,088; Saarland 863,738; Austria 7,009,016; Sudetenland 2,945,263.

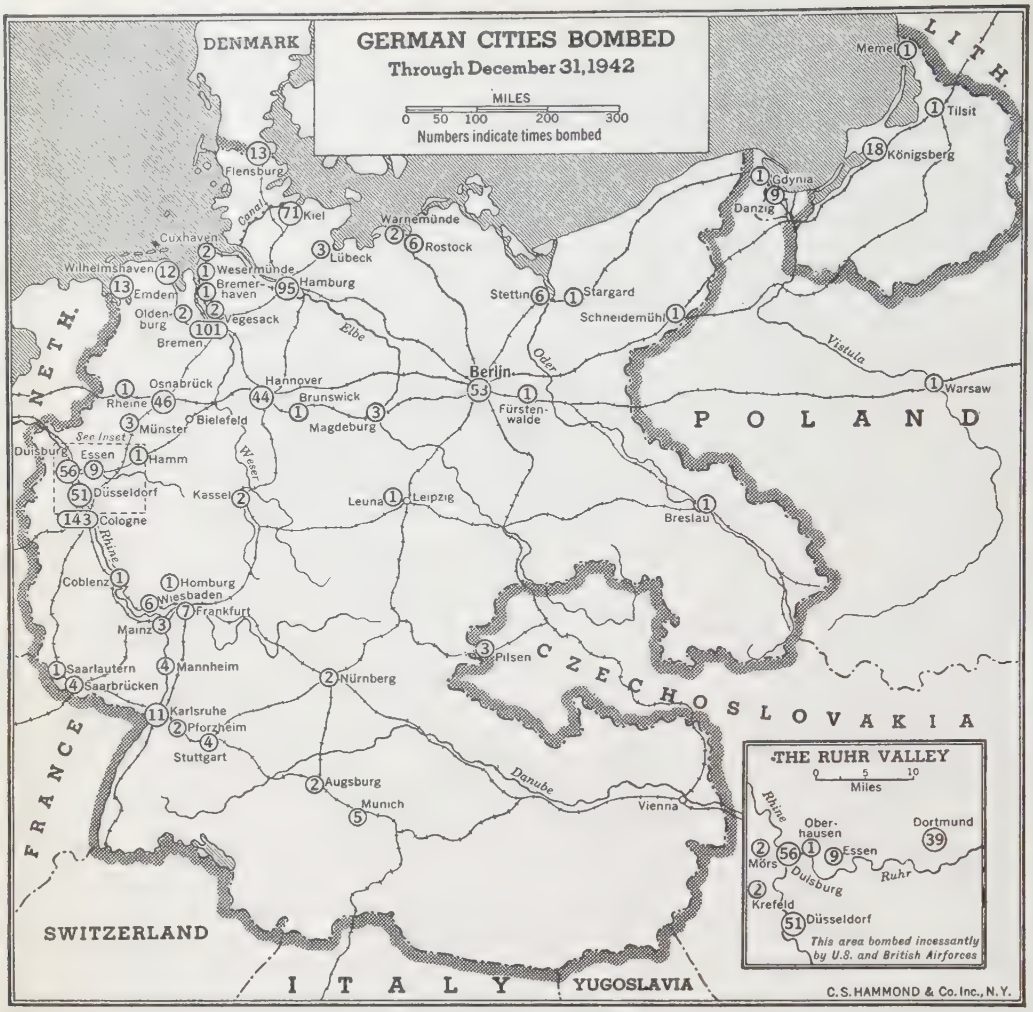
The population of "Greater Germany" in 1942 was approximately 98,582,000 as a result of the annexation during 1939–42 of the following territories: Bohemia-Moravia (6,805,000); Memel (153,000), Eupen-Malmédy (60,000); Polish lands (Danzig, Polish Corridor, Silesian border districts, totalling about 10,000,000); Alsace-Lorraine (1,900,000); and Luxembourg (301,000). This figure of 98,582,000, however, made no allowance for decreases in population caused by Germans killed in war, Poles expelled or killed, and Jews deported or exterminated, or for the increase from prisoners of war and imported foreign workers.

Outside "Greater Germany," Hitler also controlled millions of people in lands which were conquered and occupied by his armies, but which were not directly annexed to the reich: the Gouvernement General of Poland (15,000,000) under the administration of Hans Frank; Denmark (3,777,000); Norway (2,900,000); Netherlands (8,640,000); Belgium (8,386,000) and France (40,000,000), the northern three-fifths of which was "occupied" in June 1940, and the remainder in Nov. 1942, after the Anglo-American occupation of French North Africa. Alsace-Lorraine (1,900,000) was incorporated directly into the reich on Nov. 30, 1940. In addition, by the infiltration of German troops and secret agents, Germany gradually acquired domination over Slovakia (2,653,564) in 1939, and over Hungary (12,708,439), Rumania (19,934,000) and Bulgaria (6,078,000) in the winter of 1940–41. In April 1940 a blitzkrieg brought Yugoslavia (15,703,000) and Greece (7,109,000) under nazi domination. This brought the total population under German domination, both in "Greater Germany" and the occupied lands, to more than 240,000,000. Even this figure did not include the indeterminate population in the vast regions of the U.S.S.R. which Hitler conquered in 1941–42 but was beginning to lose in Nov. 1942.

History.—The chief fact in German history during 1942 was that Hitler lost the offensive both in the air and on land, and was forced to stand on the defensive. In the first years of the war, Goering's superior luftwaffe had subjected Britain to terrible bombing, but in 1942 the tables were turned. Britain's air strength outmatched that of the reich, and the R.A.F. was able to deal devastating blows from the air on Germany's cities and transportation system. Similarly, for more than two years Hitler had carried his blitzkrieg offensive steadily forward, but in 1942 his armies at Stalingrad began to be driven back, and his Afrika Korps under Gen. Rommel was routed.

British air experts had come to the conclusion that small raids directed exclusively against such specifically military objects as

ADOLF HITLER—"from paperhanger to crapehanger," by Shoemaker of *The Chicago Daily News*



MAP showing number of times German cities had been bombed by British and other allied air forces through Dec. 31, 1942. The figures are estimates only, as even official reports varied in specific cases

munition plants, oil refineries and railway centres were not sufficiently effective. Such local damage could be quickly repaired. But raids that wiped out the larger part of a whole city had far more permanent and disrupting effects on war production and on civilian activities and morale. This was a part of the lesson they had learned from the German raids on Britain. They could not take advantage of the lesson, however, until the spring of 1942, when they had greatly increased their own aircraft production and could count on the rapidly increasing production in the U.S.

The new British use of intensified mass area air attack, which would destroy whole military areas instead of local objectives, was used against Luebeck on the night of March 28, 1942. This fine old Hanseatic town, made delightfully familiar in Thomas Mann's novel, *Buddenbrooks* was important as a submarine base and as a German port through which passed the iron ores from Sweden and military supplies for the Baltic Photographs taken two weeks later showed that 40% of the streets were still choked with debris and were impassable.

Rostock, a Baltic port of 90,000 population, some 60 mi. east of Luebeck, was important as a shipping centre and because of the neighbouring Heinkel plane factories and the Neptune Shipbuilding company, manufacturers of submarines and other small naval craft. It was bombed on four successive nights beginning April 24 with the greatest weight of explosives which the R.A.F. had ever let loose to that date. Gigantic fires started on the first night were visible for 90 mi. and were still burning on the fourth night, so that the last wave of raiders had no need to drop flares to distinguish the objectives. In April also giant Lancasters, flying in daylight 1,000 mi. ove enemy territory, bombed Augsburg, where half the Diesel engines for submarines were made

The heaviest blow of all wa delivered on Cologne on th night of May 30. This Rhin city of nearly 800,000 was on of Germany's most importan arterial centres, with bridge over the Rhine, railway an barge transfer facilities, an numerous chemical, armamen and other munitions works During the 90-minute raid 3,000 tons of high explosive were dumped on it by a "four figure" air fleet of 1,130 planes The cloud of smoke rising fron it could be seen from the Dutc coast. For several days no aeria photographs of the damag could be secured because of th pall of smoke still hanging ove the stricken city. Finally it wa clear that six great gaps ha been laid waste, covering abou 5,000 acres, or eight squar miles. One gap included th great union railway station, bu the famous Gothic cathedra only a block away was onl partly damaged. Something o the psychological effect could b seen in a letter from wife t husband later found in th pocket of a dead German soldier on the Russian front: "It is more than frightful. When think of it, I cry and cry. Cologne is just a cloud of smoke. Flame came from everywhere. The trams do not run. The trains d not run. The cinema and music hall are closed, and half th people have left. We have no department stores any more. The have all gone. All the factories, all the big hotels are burnin The number of casualties was very great. If you came here o leave, I shouldn't be able to meet you at the station, becaus there is no station left."

During the summer and autumn similar attacks, though on smaller scale, were made on Mainz, Osnabrück Hanover, Breme Hamburg, Kiel, Flensburg, Mannheim, Karlsruhe, Stuttgar Frankfurt-on-Main, and on the great industrial cities crowde together in the Ruhr district. These mass area raids cut dow German war production by 10% or more, by destroying plant tying up transportation, frightening workers, and weakenin morale. American Flying Fortresses, with very effective hig altitude precision bombing, joined the R.A.F. in destructiv attacks on the Lille steel and locomotive works, the Schneide Creusot munitions plant, truck factories near Paris, submari bases at St. Nazaire and Lorient, and other vital French poin used for German war production.

Individual planes made daring low-level attacks on Germa locomotives, switches, bridges, railway stations and canal system because lack of transportation facilities had become one Hitler's most vulnerable points. Even small shells bursting an where near a boiler or firebox will usually wreck an engine, sinc the boiler is under 200 or 300 pounds pressure per square inc nd carries its own explosive charge of steam. A wrecked engine s likely to derail or wreck the whole train. It is estimated that n 1942 the Allies shot to pieces more locomotives than the German and French locomotive shops had built in two years. Hitler started the war badly deficient in locomotives and rolling stock, because he neglected the railways in his frantic effort to build up armaments. The distant war in Russia and the lack of uel for trucks had greatly increased the strain on the railways y the end of 1942.

The Russian and African Campaigns.—In Jan. 1942 Hitler's Russian front extended for more than 1,000 mi. in an irregular orth-south line from the Baltic at Leningrad, passing west of Moscow, Voronezh and Rostov, to the Sea of Azov and the Black sea. Owing to the unexpectedly firm stand of the Russians nd to the winter cold for which the Germans were not prepared, e had failed in his primary aim of annihilating the soviet rmies in 1941. During the spring of 1942 he was forced to tand on the defensive and even to retreat at some points.

As his vast army was tied down by the Russian winter and ounter-attacks, Hitler could not transfer soldiers back to civilian roduction in the munitions factories, as he had done after his revious blitzkriegs. To produce new war equipment and to ather new forces for his 1942 campaign in Russia required early six months, so that he was not ready for another great ffensive until the end of June. Meanwhile Britain and the United tates had had time greatly to increase their armaments and y Oct. 1942 had sent to Russia vast supplies, including 3,052 lanes, 4,048 tanks and 30,031 vehicles, though not all these eached Murmansk, because some were sunk by the Germans. talin likewise had been turning out great quantities of army quipment in factories already located in eastern Russia and artly supplied with machine tools which had been successfully emoved thither before the German conquest of western Russia n 1941.

In 1941 the Germans had carried on their offensive along the hole 1,000 mi. front, their main, though unsuccessful, effort eing at the centre to capture Moscow by direct attack from he west. In the 1942 offensive, which started from Kursk and Kharkov on June 28, the Germans concentrated their effort on 200-mi. front and directed it toward the southeast. To most bservers it seemed that Hitler's primary aim was not, as in 941, to annihilate the soviet army, but rather to secure economic nd strategic advantages by occupying more territory, seizing he Caucasus oil fields and then penetrating into the middle east. t was thought that he intended to threaten the British in Pales-ne and Egypt by a great sweeping pincers movement from the ast, while Rommel made a corresponding pincer attack upon Egypt from Libya in the west.

Stalin, however, in his great speech of Nov. 7, 1942, based n information gathered from dead and captive Germans, in-icated that Hitler's real main aim was to capture Voronezh, talingrad and Saratov, get control of the Volga, and then swing round in a circle westward to capture Moscow from the rear, *i.e.* from the east.

In any case, soon after advancing against Voronezh and fail-ng to capture it, Hitler made the fatal mistake of dividing his orces. One German army under Gen. Fedor von Bock, who was ater replaced by Gen. Hermann Hoth, turned east against Stalin-rad. The other continued southeastwards toward the Caucasus. t captured the relatively small Maikop oil fields, but failed to each the more important Grozny oil area, and never came within oo mi. of by far the richest oil supplies at Baku. To protect its ight flank another German army under Gen. Fritz Erich von Mannstein gradually occupied the Crimean peninsula, and on uly 1, after a very bloody 25-day siege, captured the Russian naval base at Sevastopol.

Stalingrad lies along the west bank of the Volga where the river makes a great loop to the west and comes within 40 mi. of the Don river which makes a great loop to the east. Stalingrad is of enormous strategic and economic importance, because it controls the vast traffic on the Volga and is the seat of essential steel and munitions factories. Hitler had several times announced that he would take it, but Stalin was determined that it should be defended at all costs. By using great masses of tanks, dive bombers and infantry, the Germans, aided by Hungarian and other axis troops, were able to penetrate into the city. In almost incredibly fierce hand-to-hand fighting, with the front lines often only 20 or 30 yds. apart, the attackers fought from building to building for nearly four months. But the Germans were never able to get possession of the whole city.

Finally, on Nov. 19, the Russians began a great counter-offensive to outflank the Germans to the north and the south of Stalingrad. During the next six weeks fresh Russian reserves swept forward with remarkable success. On Dec. 31 the Russians announced that in this Stalingrad counter-offensive, which encircled Germans in the Don loop as far south and west as Kotelnikovski and Millerovo, they had killed or captured 312,650 of the enemy. They also claimed to have taken or destroyed 1,791 enemy planes, 3,251 tanks, 5,910 guns, together with large amounts of other booty. These figures may have been exaggerated, but they did at least indicate a great victory.

In addition to this victory in the Don loop area, the Russians also made considerable advances northwest of Moscow in the regions of Rzhev and Velikie Luki sectors, driving the Germans back toward the important rail centre and supply base of Smolensk. In the Caucasus area also the Germans were forced to yield ground in Dec. 1942 and were in danger of being cut off by the victorious Russian armies advancing south from the Don loop toward Rostov.

A month before Hitler began his 1942 campaign in Russia, Gen. Rommel suddenly began a smashing drive toward Egypt. Starting on May 26, he rapidly swept the British out of Libya.

THE SEVENTH MEETING between Mussolini and Hitler was held April 30, 1942, at Salzburg. In this picture Mussolini is inspecting the guard of honour

Within a month he had crossed the border into the western Egyptian desert and captured 25,000 British prisoners in Tobruk and 6,000 more at Matruh. The badly mauled British Eighth army, which had lost 80,000 men, was then prudently withdrawn further back into Egypt, received reinforcements hurried up from the Nile, and was able to make a firm stand in July at El Alamein.

During the summer and early autumn of 1942 the British stood solidly at the El Alamein line, where the 40-mi. ridge between the Mediterranean and the impassable Qattara Depression to the south afforded a good line of defense. Rommel made repeated efforts to break through, but without success. Meanwhile the British had been strengthened by new war material sent from the United States and by a visit from Winston Churchill, who placed Lieut. Gen. Bernard L. Montgomery in immediate command of the Eighth army, with orders to take or destroy Rommel's army at the first opportunity.

On Oct. 23, Gen. Montgomery started his carefully planned attack, digging up land mines and slowly pushing forward his infantry into the forward German positions. Then the British tanks, strongly supported by superior air forces, forced Rommel into a retreat which rapidly became a rout. As the British had sunk many of his supply ships, he lacked gasoline for his tanks and planes. Hitler, who needed most of his planes and men on the Russian front, sent him very little aid. As a consequence Rommel continued his flight westward for a thousand miles, closely followed by the British. By the end of December he appeared to be trying to reach Tunisia to join with axis forces attempting to hold Tunis and Bizerte against the newly-landed Anglo-American North African expedition.

Education.—In the old reich in 1938 there were 51,118 public elementary schools (*grundschule*) with 7,596,437 pupils; 1,563 elementary "middle schools" teaching English and French with 272,635 pupils; 2,282 secondary schools with 670,895 pupils; 10 technical high schools with 9,554 students; and 25 universities with 48,139 students. The nazis established many special schools for training "leaders," with emphasis on comradeship, sports, nazi ideology and leadership.

Defense.—After 1935 the German army was based on the principle of universal military training for two years, in addition semimilitary training in the Hitler Youth (eight years) a Labour corps (six months). The army in 1942 consisted of nea 400 divisions of 12,000–14,000 men each if at full strength, b by Dec. 31 many divisions had become skeletal by total w losses of more than 700,000 killed and missing and 1,500,0 wounded.

The navy in 1942 consisted of the 35,000-ton battles "Tirpitz," two 26,000-ton battleships, two 10,000-ton "poc battleships," eleven cruisers, about 50 destroyers, probably m than 400 submarines, and perhaps two incomplete aircraft carri Figures for the air forces were not available.

Finance.—The unit of currency is the German mark, nomin equivalent to 40.3325 U.S. cents. The Germans also issued spe paper marks (*reichskassenscheine*) of varying value for use the occupied territories. Revenues and expenditures had not b published since 1935. The reich debt at the end of 1942 estimated at 190,000,000,000 marks, and the note circulation 22,000,000,000 marks.

Trade and Communications.—As a result of the war. many was cut off from world trade and was confined to tr with the occupied countries in Europe and a few neutrals Sweden, Switzerland and Turkey.

Her prewar trade, for which alone figures are available, is gi in Table I.

Table I.—*Imports, Exports and Balance of Trade, 1932–39*

	Total Yearly			Monthly Average		
	Imports Million marks	Exports Million marks	Balance Million marks	Imports Million marks	Exports Million marks	Balan Milli mar
1932 . . .	4,667	5,739	+1,072	389	478	+8
1933 . . .	4,204	4,871	+ 667	350	406	+5
1934 . . .	4,451	4,167	− 284	371	347	−2
1935 . . .	4,159	4,270	+ 111	347	356	+
1936 . . .	4,218	4,768	+ 550	352	397	+4
1937 . . .	5,468	5,911	+ 443	456	493	+3
1938* . .	6,052	5,620	− 432	504	468	−3
1939† . . .	2,755	2,814	+ 59	458	468	+1

*Figures do not include Austria and Sudeten area.
†Figures are for the first six months of 1939 only.

The German state railway (*reichsbahn*) in 1938 inclu 53,330 km. (33,076 mi.) of standard-gauge lines and 879

(546 mi.) of narrow-gauge lines. Privately owned lines included 3,732 km. (2,313 mi.) of standard and 752 km. (476 mi.) of narrow gauge. In spite of Germany's stripping the conquered territories of much of their rolling stock, the German railways during the war were put under a very heavy strain and in 1942 were in worse condition than in 1939. In 1938 there were 132,094 mi. of road in Germany, and by the middle of 1939, 2,264 mi. of the new concrete automobile highway network (*reichsautobahn*) were opened to traffic. This new highway had been partly designed for strategic purposes, but owing to lack of fuel for trucks was of little military value in 1942.

Agriculture, Manufactures and Mineral Production.—Germany's prewar agricultural and mineral production is shown in Tables II and III.

Table II.—*Agricultural Production from 1932 to 1939*
(In thousands of metric tons)

	Rye	Wheat	Barley	Oats	Potatoes	Sugar Beets	Fodder Beets
1932 . . .	8,363	5,003	3,214	6,650	47,016	7,875	34,486
1933 . . .	8,727	5,604	3,468	6,952	44,071	8,578	30,716
1934 . . .	7,607	4,532	3,203	5,452	46,780	10,394	33,804
1935 . . .	7,478	4,667	3,387	5,385	41,015	10,567	34,711
1936 . . .	7,386	4,426	3,399	5,618	46,323	12,095	37,826

Owing to the recruiting of men from fields and factories for the army and to the demand for increased production caused by the war, and also to the greater amount of labour required to produce substitute instead of natural products, Germany was suffering a severe labour shortage by 1942. This was partly met by the increased employment of women and children, and partly by the use of prisoners of war and of foreign workers who were compelled by lack of food at home to accept "slave work" in Germany. Goering stated on Oct. 5, 1942, probably with exaggeration, that there were 5,000,000 prisoners of war and 6,000,000 foreigners thus employed by the nazis.

Gest, Morris (1881–1942), U.S. theatrical producer, was born January 17 in Vilna (then in Russia) and emigrated alone to the United States when a mere boy of eight. Young Gest made his start in the theatre as a property man for a Yiddish theatre group and at 19 years of age became a producer in Boston. For a short time he was associated with Oscar Hammerstein, and from 1905 to 1928 was in partnership with F. Ray Comstock, with whom he produced more than 50 plays. Gest introduced to U.S. audiences the Russian ballet, Balieff's *Chauve-Souris* and the Moscow Art Theatre; he brought Eleonora Duse and Max Reinhardt to the United States. During World War I, Gest staged *Chu-Chin-Chow,* with which he established his reputation as a producer of lavish spectacles. In 1924, he engaged Reinhardt to produce *The Miracle,* a massive production that cost more than $600,000. Some years later he produced the Freiburg Passion play. In the 1930s, however, the public lost its taste for the spectacular in the theatre. His last New York effort was with a village of midgets called Little Miracle Town, at the New York World's Fair, 1939. Overtaken by illness in his last years, the familiar figure in the big black hat and the flowing cravat had disappeared from 42nd street. He died in New York city, May 16.

Ghormley, Robert Lee (1883–), U.S. naval officer, was born Oct. 15 in Portland, Ore. He was graduated from Annapolis in 1906 and was in command of U.S. forces during the Nicaraguan campaign of 1912. During World War I, he was decorated for his work as assistant director of the overseas division of the Naval Overseas Transportation division. In 1931, he was appointed assistant chief of staff to the navy's commander-in-chief, and in 1932 he headed the tactical section (fleet training division) in the office of the naval operations chief. Made a rear admiral in Oct. 1938 and a vice admiral in 1941, he returned to active duty in March 1942. He was ordered to Auckland on April 22, 1942, to set up a joint U.S.-New Zealand naval command and was appointed commander of Allied land, sea and air forces in a South Pacific zone. Adm. Ghormley directed the landing of marines on the Solomon Islands on Aug. 7, 1942, and the ensuing land-sea-air operations there until Oct. 24, when he was relieved of his post by Vice-Adm. William F. Halsey.

Gibbs, George (1870–1942), U.S. novelist and painter, was born March 8 in New Orleans. Following in the footsteps of his father, a naval surgeon, Gibbs attended the Naval academy for three years. While at school, however, he showed talent for writing and drawing; he left Annapolis to study at the Corcoran School of Art in Washington. He spent his spare time writing for New York newspapers and in 1901 produced a best-seller, *In Search of Mademoiselle,* a book dealing with the conquest of Florida. He wrote more than 50 books, including *The Bolted Door* (1911), *The Yellow Dove* (1915), *The Secret Witness* (1917), *The Splendid Outcast* (1920), *Fires of Ambition* (1923), *The Up-Grade* (1927), *The Road to Bagdad* (1938), *The Silver Death* (1940) and *The Sleeper Wakes* (1941). He also painted portraits of many notable Americans. Gibbs died in Philadelphia, Oct. 10.

Gilmore, John Washington (1872–1942), U.S. agronomist and educator, was born May 9 in White county, Arkansas. He took his bachelor's degree in agriculture at Cornell university in 1898. He went to China to establish the agricultural college at Wuchang. He later established similar schools in the Philippines. After his return to the United States, he was assistant professor of agriculture at Cornell and professor of agriculture at Pennsylvania State college. He was president of the College of Hawaii, which later became the University of Hawaii, 1908–13. He was professor of agronomy at the University of California after 1913. He died in Woodland, Calif., June 25.

Ginger: *see* SPICES.

Giraud, Henri Honoré (1879–), French army officer, was born Jan. 18 in Paris and attended St. Cyr Military academy and the École Supérieure de Guerre. Early in World War I, he was wounded and captured by the Germans, but escaped in 1915 and returned to the front. In June 1917, his battalion captured Fort Malmaison. Toward the end of the war, he was chief of staff of a Moroccan division. He participated in the Riff campaign, and Riff leader Abd-el-Krim surrendered to his forces in Jan. 1926. After the German breakthrough at Sedan in May 1940 during World War II, General Giraud took command of the Allied armies in northern France; but he and his entire staff were captured and interned in Koenigstein prison, Saxony. In April 1942, Giraud staged another daring prison break and escaped to Vichy via Switzerland. The Germans offered a 100,000-mark reward for his capture. Disguised as an old woman, Giraud then fled Vichy, went to Algeria and offered his services to the U.S. armies at the start of the North African campaign. On Nov. 15, 1942, Admiral Jean Darlan, self-proclaimed protector of French interests in Africa, named Giraud commander of all French armed forces in North Africa. Marshal Pétain berated Giraud as a "traitor" for joining the Allies. After Darlan's assassination, Giraud was named as his successor as high commissioner of French North Africa, Dec. 27.

Girl Scouts. The Girl Scouts in 1942 put special emphasis on doing jobs that freed U.S. adults for other war work, on defense activities suited to girls from seven to eighteen, and on aiding the sale of war bonds and stamps. Older girls cared for young children so that mothers could volunteer their time elsewhere; served as farm aides, helping to save the crops in many parts of the country; acted as plane spotters and OCD messengers. A new program for Seniors, Wing Scouts, was launched in July 1942 to prepare girls for all types of aviation work.

Younger Scouts cultivated victory gardens and canned the produce; collected scrap metal, fat, rubber and miscellaneous items needed by relief organizations; kept USO cookie jars filled; and with older Scouts contributed more pennies than ever before to the Juliette Low memorial fund set up in memory of the founder of girl scouting in the United States to foster friendship among girls of all nations. Because of the spread of war to the western hemisphere, no hemisphere encampment was held in 1942, but funds were used for the relief of children in Britain, China, the U.S.S.R. and Greece. They also contributed war stamps to the Girl Scout Victory fund which, with the U.S. treasury department's permission, was to be used later for "the alleviation of distress among the children of the world." At the end of 1942 there were approximately 720,000 registered members of the Girl Scout organization in the United State Of these, approximately 130,000 were adults and the rest we girls.

Glands: *see* Endocrinology; Medicine.

Glass. The U.S. glass industry proceeded toward more com plete adjustment to wartime conditions in 1942. Som technicians and many other employees entered military servic and the replacement of men by women increased. Certain co oured glasses and much of the lead glass entering luxury war went out of production on account of material shortages. Insuf ciency of the cleaner fuels brought gas producers back into ser ice. Lack of arsenic and cobalt created problems in decolourizin The essential heavy chemicals remained abundant, but the u of metallic oxides for colours was restricted.

In striking contrast with the situation in 1917, World War found the U.S. ready to produce sufficient optical glass of hig quality. A new plant financed by the government began produ tion at Parkersburg, W.Va., in 1942.

Plate glass, declining to one-third the output of 1941, filled a important military role. Laminations of toughened plate wi plastic binding sheets produced panes with better resistance bullets and to explosion shock than any previously made. Wi dow-glass production maintained the high level of 1941. In t U.S. glass industry as a whole, prices remained stable; employe numbered 81,000 in 1942 as compared with 93,000 in 1941; t total value of product exceeded $470,000,000.

Bottles and containers scored a record production of 77,000,0 gross. This gain reflected the replacement of tin cans by gla jars, as well as the expanded national income. Attempts to r place metal and rubber in caps and closures were partially su cessful.

Glass continued to find more new technical and military use Glass wool and fibre, by virtue of the properties of heat a electrical insulation and high chemical resistance, became i creasingly important. Cellular glass (foam glass) was advanc as a material for life-rafts and buoys.

A sweeping federal court decision ordered nine important co porations to relinquish holdings of each other's stock, and thre open for licence without royalty all the essential patents on gla feeders and bottle-forming machinery. Appeals were taken fr the decision, which, if it were to stand, presaged tremendo changes in the patent monopolies of other large industries.

(S. R. S.)

Gliding. Practically all gliding activities in the U.S. duri 1942 were of a military nature. The army and na glider programs absorbed nearly all experienced glider designe builders and pilots. Brought into production were the army's and 15-place gliders, both as large as twin-engined transports

U.S. AIR-BORNE TROOPS entering a big transport glider, under test during 1942 at Wright field, Ohio

ombers. These gliders were in use at army schools as advanced rainers.

A development of importance in this glider program was the se of the pickup. This device, in service for air mail for about hree years, was applied to picking up gliders by an aeroplane in ight. Expected to provide a hitherto unobtainable flexibility to oth military and commercial air transport, the pickup was exected to make possible the retrieving of gliders which have unded and been unloaded in fields far too small for the landing nd take-off of the towing transport plane. In other words, it ould make possible the aerial delivery as well as take-off of men nd materiel almost anywhere.

Despite the almost eclipsing of civilian gliding activities by the ar effort, interest in glider training in high schools steadily inreased. Local glider training programs were started in the states f Minnesota and New York, the cities of Detroit and Los ngeles, and the University of Denver. (L. B. BA.)

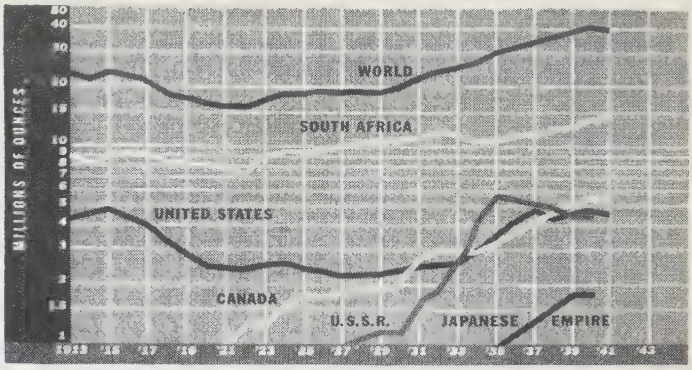
oering, Hermann Wilhelm (1893–), German reichsmarshal and statesan, was born at Rosenheim, Bavaria, on Jan. 12 and was comander of the famed Richthofen squadron in the German air rce during World War I after Richthofen's death. Goering was n early member of the nazi party and became air minister and inister of the interior in 1933 upon Hitler's accession to the ancellorship. (See *Encyclopædia Britannica.*) On July 19, 1940 itler conferred the newly created title of marshal of the reich n Goering. Goering, appointed head of the economics general aff on Jan. 4, 1940, had supreme control over Germany's ecoomic life.

As usual, Goering spent much time in 1941 at the various fightig fronts; in addition, he took over some of the diplomatic duties rmerly reserved to Hitler and Ribbentrop. On Jan. 11, 1941, oering said that the luftwaffe could do "one hundred to one ousand times more damage" than the R.A.F. During 1942 the .A.F. punctured this boast with raids on the reich, climaxed by e great 1,000-plane attacks on Essen and Cologne, that were r more destructive than any luftwaffe attack on England. Goerig thereafter slipped into relative obscurity, save for a speech n Oct. 4, 1942, when he assured his countrymen, fearful of nother winter campaign in Russia, that they would be fed, if ecessary, at the expense of the conquered nations.

old. Next to the decline in world production, the outstanding development of 1942 with respect to gold was the termiation of the eight-year rise in the gold reserves of the United tates, a phenomenon which had added no less than $18,701,00,000 to the U.S. monetary stocks.

When 1941 ended, U.S. gold reserves stood at $22,737,000,000; n Dec. 31, 1942, they stood at $22,726,000,000. In amounts as reat as these this decline of $11,000,000 is, of course, purely ominal, but any decline at all constitutes a striking contrast ith what occurred during the preceding eight years. The smallst net addition to U.S. gold stocks in any of these years was 742,000,000, recorded in 1941, while at the peak of the gold ovement to the United States, in 1940, the figure reached the rodigious total of $4,351,000,000. In 1934 the increase, at $4,02,000,000, was almost as large as that of 1940, but in the rmer year the rise was accounted for in large part by the official evaluation of the statutory price of gold from $20.67 an ounce o $35.

Monetary gold stocks are affected by four factors; namely, exorts, imports, gold newly mined in the United States and gold earmarked for the account of other countries. When gold is placed under earmark the effect is the same as if it had been exported, so far as gold stock is concerned; when gold is released from earmark the result is the same as if that much additional gold had been imported or produced by U.S. mines. Thus, in Table II, which shows the major changes in the gold stock of the United States from 1934 through Oct. 1942, a plus sign before the total of earmarked gold indicates a net release of the metal from earmark, and a minus sign a net increase in the amount under earmark.



GOLD PRODUCTION: world total and output of the principal producing countries, as compiled by *The Mineral Industry*

The United States, it will be seen from Table II, did not lose gold in 1942 through actual exports of the metal. The "loss" was a bookkeeping loss, and not a physical one, and was accounted for by earmarking gold for foreign account. No figures were available on the country's imports in 1942, but they could be computed approximately for the first ten months of the year. Earmarkings during that period amounted to $417,000,000 but domestic gold production and net imports, since they produced a net increase in the gold stock of $4,000,000, must have totalled $421,000,000. Since we know that domestic gold production was $111,000,000 this indicates that net imports must have been about $310,000,000.

The United States lost gold on balance in 1942 mainly because the countries debtor to it on lend-lease either had no gold to send or lacked the means of sending it, while the U.S. continued to make gold available to those having favourable trade balances. The data in 1942 were neither complete nor up to date as to the ownership of the gold placed under earmark, though it was fairly

†Includes gold in the inactive account.

‡Net gold import figures were not published in 1942.

§Gold under earmark for foreign account on Oct. 31, 1942, totalled $2,632,000,000.

‖Preliminary.

obvious that the Latin-American countries had been accumulating the metal because the United States had not been able to sell them goods in sufficient quantities to offset its imports from them. Evidence of this was to be seen in the fact that in the first ten months of 1942 Venezuela's gold reserves were up $23,000,000 while in the first nine months those of Brazil were up $12,000,000, Chile $6,000,000, Colombia $5,000,000 and Peru $3,000,000. Switzerland, Sweden and Turkey showed the largest increases in gold holdings, with Swiss holdings rising $140,000,000. Most of the increase in the case of Switzerland was at the expense of U.S. stocks, and much in the case of Sweden. It was not clear whether Turkey's acquisitions were from the United States or Germany. (*See* also EXCHANGE CONTROL AND EXCHANGE RATES.)

(E. H. Co.)

Production.—Each year since 1929 a new record high in world gold production has been announced, but this advance seems to have come to an end with 41,200,000 oz. in 1940. Although the publication of gold data was not suspended in any country, war conditions slowed down the distribution of information, so that it was scanty; definite information was lacking for 1941 from all of Asia and Europe, and from many of the less important producers elsewhere, but such data as were available indicated a reduction of output in 1941 to about 40,400,000 oz., South Africa and Canada were the only important sources not showing a decrease.

During the first half of 1942 production in South Africa was approximately at the 1941 level, but later months showed a slight decrease; the total for the year was expected to be about 200,000 oz. less than the 14,386,000 oz. of 1941.

Canadian production to the end of July 1942 was 2,915,500 oz., against 3,093,000 oz. in the same period of 1941, and 5,328,300 oz. for the full year 1941.

Nothing was received from Mexico after early in 1942, but the January–February total was 6% less than the average return of 1941, which in turn was 10% less than that of 1940.

In the United States the 1942 output was expected to show a heavy drop from that of 1941. While no late statistics were received, as early in 1942 as the end of the first quarter, production had dropped one-third below the corresponding level of 1941, and in October an order of the War Production board declared the mining of gold an industry "unessential" in the war program, and instructed that all mines be closed down in the shortest possible time, in order to make the manpower used in these mines available for use in mining operations more essential to the war pr gram. Small mines, treating less than 100 tons of ore monthl were exempted from the order, as were also mines that produce along with gold substantial amounts of other metals that are e sential to the war program. This order was expected to fre 3,000–4,000 miners for work considered more important, and seemed possible that some of the idle machinery might also b transferred to active mines. It was difficult to estimate to ju what extent this action would reduce the gold output of the cou try, but in 1940 apparently not more than 15% of the tot gold output was made in association with other metals, thoug this figure was expected to be increased to some extent by th exemption of small mines. (*See* also FEDERAL RESERVE SYSTEM MINERAL AND METAL PRICES AND PRODUCTION.) (G. A. Ro.)

Gold Coast: *see* BRITISH WEST AFRICA.

Golf. Within a month from the time that the Japanese attacke Pearl Harbor, the United States Golf association, gover ing body of the game, announced that championships held ann ally under its sponsorship would be discontinued for the duratio At the same time the association began to develop plans for orga izing the brotherhood of golfers as an auxiliary force to contribu to the nation's war effort.

A short time later, the War Production board announced th war conditions made necessary restrictions on the use of rubber the manufacture of golf balls. This, in turn, was followed by ban on the further use of steel in the manufacture of golf clu and eventually on the use of the metal for repairs and repla ment of parts.

Meanwhile the U.S.G.A. was undertaking a twofold plan utilizing interest in the game and facilities created as adjun thereof. First was the collection of funds for various organiz tions and services identified with the war effort, and the prom tion of the sale of war bonds and stamps. Second was the u of the thousands of clubhouses and courses throughout the cou try as recreation centres for men in the military services.

Full reports on the results of these efforts were not availa by the close of 1942. Various fund-raising plans were devised a recommended to clubs. It is not possible to detail them he but results from one such plan may be cited. This consisted three special holiday contests among club members, on Mem rial day, Independence day and Labour day. Proceeds from the tournaments netted more than $100,000, which was turned ov to the Red Cross. The Hale America tournament, played in C cago under the joint sponsorship of the U.S.G.A., the Professio Golfers' association and the Chicago District Golf associati netted more than $25,000, donated to U.S.O. and Navy Em gency Relief.

The Professional Golfers' association collaborated fully in t general plan, handling details for a large number of exhibiti matches, which saw dozens of wellknown amateurs taking pa These exhibitions brought back famous heroes of the game of decade and more ago, including Bobby Jones, Tommy Armo Walter Hagen and others, as well as links enthusiasts from t stage and screen, Bob Hope and Bing Crosby among them. was estimated that from all sources golf raised at least $1,000,0 for patriotic purposes, and promoted the sale of four to fi million dollars in war bonds.

Throughout the country, particularly where they were ne military concentrations, golf clubhouses and courses served recreation centres for men in uniform. Free driving ranges we constructed in many instances. More than 14,000 golf clubs we donated to men in the services along with many thousands golf balls.

The green section of the U.S.G.A. contributed a notable and valuable service in another way. Recognized for many years as a leading source of reliable information on the production of fine turf, this organization was helpful in producing satisfactory turf on flying fields.

Dr. John Monteith, director of the green section, was in 1942 a civilian employee of the army engineering corps.

While none of the championships sponsored by the U.S.G.A. was held, tournament competition of a major character was not wholly suspended. The Hale America Open tournament was in fact a kind of unofficial Open championship, attracting the outstanding amateurs and professionals, some of whom took part by grace of leaves or furloughs from their military organizations.

Top honours in this tournament went to golf's Mighty Atom, Ben Hogan, who won with a 72-hole total of 271, three strokes better than Jimmy Demaret and Mike Turnesa, who tied for second place. Hogan's total was the lowest ever scored in competition of such proportions, although it was generally conceded that the Ridgemoor Country club course, over which it was played, was less severe than courses usually named for the official Open championship.

The tournament contributed further to the tradition of finishing disappointments, which had characterized Open championships over the years. Smiling Jimmy Demaret was the victim this time. With only four holes of the final round remaining, Demaret was leading the field by 2 strokes and appeared the probable winner. However, a poor tee-shot at the 15th unnerved him, and he dropped five shots to Hogan over these last four holes.

The Professional championship was the other important competition, and carried the sanction of the Professional Golfers' Association. Played at the Seaview club of Atlantic City, it saw the crowning for the first time of Sam Snead as a national champion in the United States. Snead, who had suffered more than a few disappointments, won when he defeated Corporal Jim Turnesa in the final match by 2 and 1, after being 3 down at the end of the first round. Shortly after taking the title, he was inducted into the navy.

To a large extent, Corporal Turnesa, on furlough from Fort Dix, N.J., was the real hero of the tournament. Next to the youngest of six brothers famous in golf since Joe, the eldest, barely missed winning the Open championship at Columbus, O., back in 1926, the soldier entered this championship practically unheralded. However, he began by finishing a stroke back of the medalist, Harry Cooper, in the qualifying test. Then en route to his final-round meeting with Snead, he eliminated, among others, Ben Hogan and Byron Nelson, both popular favourites to win, defeating them on successive days.

For the third successive year, Ben Hogan won the Vardon trophy, emblematic of the year's best among professional golfers, and he also topped the field in total prize money. Hogan scored 400 points in the Vardon trophy race, with Byron Nelson second at 285 and Snead third with 255. In prize money, Hogan totalled $13,143. Nelson with $9,601 was second, while Snead was third with $8,078.

War restrictions imposed heavy hardships in the operations of golf clubs. Transportation was a difficult problem, and shortage of manpower made course upkeep a difficult problem. Many clubs were operating on a semi-public basis. In some instances entire club properties were taken over for military uses. Except for strictly club events, indications were for little or no competitive golf during 1943. (I. BN.)

Göring, Hermann Wilhelm: *see* GOERING, HERMANN WILHELM.

Gortner, Ross Aiken

(1885–1942), U.S. biological chemist, was born March 20 near O'Neill, Neb. He earned degrees from Nebraska Wesleyan university, Toronto and Columbia. He joined the faculty at the College of Agriculture, University of Minnesota, as associate professor of soil chemistry in 1914. Later he became professor of agricultural biochemistry and chief of the latter department from 1917 until his death. Dr. Gortner worked on chemistry of cereals, the improvement of bread flours, and did special research on nitroso compounds, formation and chemistry of animal pigments, chemistry of embryonic growth, and soil analysis. In 1926, he became consultant of the chemical warfare service of the U.S. army.

Among his published works was a widely used textbook *Outlines of Biochemistry* (1929). He died in St. Paul, Minn., Sept. 30.

Government Departments and Bureaus.

The following are the leading officers of the more important government departments and bureaus of the United States. The date for the information is Jan. 1943.

Department or Bureau	*Name*	*Post*
Department of State	*Hull, Cordell	Secretary
	*Welles, Sumner	Under-Sec'y
Office of Foreign Relief and Rehabilitation Operations	Lehman, Herbert H.	Director
Department of the Treasury	Morgenthau, Henry, Jr.	Secretary
	Bell, Daniel W.	Under-Sec'y
Bureau of Comptroller of Currency	Delano, Preston	Comptroller
Treasurer of the U.S.	Julian, William A.	Treasurer
Bureau of Customs	Johnson, W. R.	Commissioner
Bureau of Internal Revenue	Helvering, Guy T.	Commissioner
War Department	*Stimson, Henry L.	Secretary
	Patterson, Robert P.	Under-Sec'y
General Staff	*Marshall, George C., Gen.	Chief of Staff
Services of Supply	*Somervell, Brehon, Lt. Gen.	Comm'd'g Gen.
Army Ground Forces	McNair, Lesley J., Lt. Gen.	Comm'd'g Gen.
Army Air Forces	*Arnold, H. H., Lt. Gen.	Comm'd'g Gen.
Department of Justice	*Biddle, Francis	Att'y-Gen.
Solicitor General	Fahy, Charles	Solic. Gen.
*Federal Bureau of Investigation	Hoover, J. Edgar	Director
Bureau of Prisons	Bennett, James V.	Director
Immigration and Naturalization Service	Harrison, Earl G.	Commissioner
*Post Office Department	Walker, Frank C.	Postm'r Gen.
Department of the Navy	*Knox, Franklin	Secretary
	Forrestal, J. V.	Under-Sec'y
Office of Commander in Chief, U.S. Fleet, and Chief of Naval Operations	*King, Ernest J., Adm.	Commander in Chief, U.S. Fleet, and Chief of Naval Operations
Bureau of Naval Personnel	Jacobs, Randall, Rear Adm.	Chief
Bureau of Ordnance	Blandy, W. H. P., Rear Adm.	Chief
*U.S. Marine Corps Headquarters	Holcomb, Thomas, Lieutenant Gen.	Commandant
*U.S. Coast Guard	Waesche, Russell R., Vice Adm.	Commandant
Department of the Interior	Ickes, Harold L.	Secretary
	Fortas, Abe	Under-Sec'y
General Land Office	Johnson, Fred W.	Commissioner
Office of Indian Affairs	Collier, John	Commissioner
Office of Solid Fuels Coordinator for War	Ickes, Harold L.	Coordinator
Office of Fishery Coordination	Ickes, Harold L.	Fishery Co-ordinator
Geological Survey	Mendenhall, W. C.	Director
*Fish and Wildlife Service	Gabrielson, Ira N.	Director
Bureau of Reclamation	Page, John C.	Commissioner
National Park Service	Drury, Newton B.	Director
Bureau of Mines	Sayers, R. R.	Director
Division of Territories and Island Possessions	Thoron, Benjamin W.	Director
Department of Agriculture	*Wickard, Claude R.	Secretary
	Appleby, Paul H.	Under-Sec'y
Agricultural Research Administration	Auchter, E. C.	Administrator
Bureau of Animal Industry	Mohler, John R.	Chief
*Bureau of Agricultural Chemistry and Engineering	Skinner, W. W.	Acting Chief
Bureau of Dairy Industry	Reed, Ollie E.	Chief
Bureau of Entomology and Plant Quarantine	Annand, P. N.	Chief
Office of Experiment Stations	Jardine, James T.	Chief
Bureau of Plant Industry	Salter, R. M.	Chief
Bureau of Home Economics	Stanley, Louise	Chief
Bureau of Agricultural Economics	Tolley, Howard R.	Chief
*Commodity Credit Corporation	Hutson, J. B.	President
Office for Agricultural War Relations	Bledsoe, Samuel B.	Director
Agricultural Extension Service	Wilson, M. L.	Director of Extension Work

Department or Bureau	*Name*	*Post*
Food Distribution Administration	Hendrickson, Roy F.	Director
Agricultural Marketing Administration	Hendrickson, Roy F.	Administrator
Sugar Agency	Bernhardt, Joshua	Chief
Food Production Administration	Parisius, Herbert W.	Director
Agricultural Conservation and Adjustment Administration	Townsend, M. Clifford	Administrator
Agricultural Adjustment Agency	Wallace, Fred S.	Chief
Soil Conservation Service	Bennett, Hugh H.	Chief
Federal Crop Insurance Corporation	Smith, Leroy K.	Manager
Farm Credit Administration	Black, Albert G.	Governor
Farm Security Administration	Baldwin, C. B.	Administrator
Forest Service	Lyle, F. Watts	Chief
Office of Foreign Agricultural Relations	Wheeler, L. A.	Director
Rural Electrification Administration	Slattery, Harry	Administrator
Department of Commerce	*Jones, Jesse H.	Secretary
	Taylor, Wayne C.	Under-Sec'y
Bureau of the Census	Capt, James C.	Director
Bureau of Foreign and Domestic Commerce	Jones, Grosvenor M.	Acting Director
*National Bureau of Standards	Briggs, Lyman J.	Director
*Coast and Geodetic Survey	Colbert, Leo O.	Director
Civil Aeronautics Board	Pogue, L. Welch	Chairman
*Reconstruction Finance Corporation	Henderson, Charles B.	Chairman
War Damage Corporation	*Jones, Jesse H.	Chairman
*Export-Import Bank of Washington	Pierson, Warren L.	President
Patent Office	Coe, Conway P.	Commissioner
Weather Bureau	Reichelderfer, F. W.	Chief
Department of Labor	Perkins, Frances	Secretary
	Tracy, D. W.	Asst. Sec'y
U.S. Conciliation Service	Steelman, J. R.	Director
Bureau of Labor Statistics	Lubin, Isador	Commissioner
Children's Bureau	Lenroot, Katharine F.	Chief
Women's Bureau	Anderson, Mary	Chief
Wage and Hour and Public Contracts Divisions	Walling, L. Metcalfe	Administrator
Federal Security Agency	*McNutt, Paul V.	Administrator
Office of Education	Studebaker, John W.	Commissioner
Public Health Service	Parran, Thomas	Surgeon Gen.
Social Security Board	Altmeyer, Arthur J.	Chairman
Food and Drug Administration	Campbell, W. G.	Commissioner
*Federal Works Agency	Fleming, Philip B., Brig. Gen.	Administrator
Public Buildings Administration	Reynolds, W. E.	Commissioner
Public Roads Administration	MacDonald, Thomas H.	Commissioner
Public Works Administration	Gilmore, Maurice E., Col.	Commissioner
Work Projects Administration (in liquidation)	Fleming, Philip B., Brig. Gen.	Acting Commissioner
Independent Offices		
*Federal Communications Commission	Fly, James L.	Chairman
*Federal Deposit Insurance Corporation	Crowley, Leo T.	Chairman
Federal Power Commission	Olds, Leland	Chairman
*Federal Reserve System, Board of Governors of the	Eccles, Marriner S.	Chairman
Federal Trade Commission	Ayres, William A.	Chairman
*Government Printing Office	Giegengack, A. E.	Public Printer
*Interstate Commerce Commission	Aitchison, Clyde B.	Chairman
Library of Congress	MacLeish, Archibald	Librarian of Congress
National Advisory Committee for Aeronautics	Hunsaker, Dr. Jerome C.	Chairman
National Capital Park and Planning Commission	Grant, U. S., III, Brig. Gen.	Chairman
*National Labor Relations Board	Millis, Harry Alvin	Chairman
National Mediation Board	Cook, George A.	Chairman
Railroad Retirement Board	Latimer, Murray W.	Chairman
*Securities and Exchange Commission	Purcell, Ganson	Chairman
Tax Court of the United States	Murdock, J. Edgar	Chairman
*Smithsonian Institution	Abbot, C. G.	Secretary
*Tennessee Valley Authority	Lilienthal, David E.	Chairman
*The National Archives	Buck, Solon J.	Archivist
U. S. Civil Service Commission	Mitchell, Harry B.	President
U. S. Employees' Compensation Commission	Swofford, Mrs. Jewell W.	Chairman
U.S. Maritime Commission	*Land, E. S., Rear Adm.	Chairman
U.S. Tariff Commission	Ryder, Oscar B.	Chairman
*Veterans Administration	Hines, F. T., Brig. Gen.	Administrator
Executive Office of the President		
Bureau of the Budget	Smith, Harold D.	Director
National Resources Planning Board	Delano, Frederic A.	Chairman
Emergency War Agencies		
*Office for Emergency Management	Coy, Wayne	Liaison Officer
*Board of War Communications	Fly, James L.	Chairman
*National War Labor Board	Davis, William H.	Chairman

Great Britain.—The following were His Majesty's chief of cers of state and the chief permanent officials of the more ir portant of the government departments of Great Britain at t close of 1942:

Ministry or Department	*Name*	*Post*
Admiralty, The Board of	A. V. Alexander	First Lord
	Sir Henry Markham	Permanent Secretar
Agriculture and Fisheries	R. S. Hudson	Minister
	Sir Donald Fergusson	Permanent Secretar
Aircraft Production	*Sir Stafford Cripps	Minister
	Sir Archibald Rowlands	Permanent Secretar
Air Ministry	*Sir Archibald Sinclair	Secretary of State
	Sir Arthur Street	Perm'nt Under-sec'y
Assistance Board	Lord Soulbury	Chairman
	Sir George T. Reid	Secretary
Burma Office	L. S Amery	Secretary of State
	Sir David T. Monteath	Perm'nt Under-sec'y of State
Cabinet Office	Sir Edward Bridges	Secretary
Civil Service Commission	A. P. Waterfield	1st Commissioner
Colonial Office	Oliver Stanley	Secretary of State
	Sir George Gater	Perm'nt Under-sec'y
Commissioners of Crown Lands	The Minister of Agriculture and Fisheries (*ex-officio*)	Commissioner
	O. S. Cleverly	Perm'nt Commissio
Crown Agents for the Colonies	Sir W. Cecil Bottomley	
	H. C. Thornton	
Customs and Excise, Board of	Sir Archibald Carter	Chairman
Dominions Office	*C. R. Attlee	Secretary of State
	Sir Eric Machtig	Perm'nt Under-sec'y
Duchy of Lancaster	A. Duff Cooper	Chancellor
Economic Warfare, Ministry of	Earl of Selborne	Minister
	Earl of Drogheda	Director-General
Education, Board of	R. S. Butler	President
	Sir Maurice Holmes	Permanent Secretar
Food, Ministry of	*Lord Woolton	Minister
	Sir Henry L. French	Secretary
Foreign Office	*Anthony Eden	Secretary of State
	Sir Alexander Cadogan	Perm'nt Under-sec'y
Fuel and Power, Ministry of	Gwilym Lloyd George	Minister
	Sir Frank N. Tribe	Secretary
Health, Ministry of	Ernest Brown	Minister
	Sir John Maude	Secretary
Home Office and Ministry of Home Security	Herbert Morrison	Secretary of State
	Sir Alexander Maxwell	Perm'nt Under-sec' Home Office
	Sir Harold Scott	Secretary, Ministry Home Security
India Office	L. S. Amery	Secretary of State
	Sir D. T. Monteath	Acting Perm'nt Und sec'y
Information, Ministry of	Brendan Bracken	Minister
	C. J. Radcliffe	Director-General
Inland Revenue, Board of	Sir Cornelius J. Gregg	Chairman
Labour and National Service, Ministry of	*Ernest Bevin	Minister
	Sir T. W. Phillips	Secretary
Lord Chancellor	Viscount Simon	Lord Chancellor
Lord Privy Seal	Viscount Cranborne	Lord Privy Seal
Minister without Portfolio	Sir William Towitt	(Dealing with post reconstruction)
Minister of State (Cairo)	R. G. Casey	
Deputy Minister of State (Cairo)	Lord Moyne	
Minister Resident in W. Africa	Viscount Swinton	
Minister Resident in N.W. Africa	Harold Macmillan	
Minister Resident in Washington	J. J. Llewellin	
Paymaster-General's Office	Lord Cherwell	Paymaster-General
	L. Cuthbertson	Asst. Paymaster-ge
Pensions, Ministry of	Sir Walter Womersley	Minister
	Sir A. Cunnison	Permanent Secretar
*Post Office	Capt. H. F. C. Crookshank	Postmaster-general
	Sir Thomas Gardiner	Director-general
Privy Council Office	Sir John Anderson	Lord President
	E. C. E. Leadbitter	Clerk of the Counci

ant, Elihu

(1873–1942), U.S. educator and archaeologist, was born July 12 in Stevensville, Pa. He re- ved his Ph.D. and S.T.B. degrees from Boston university, and ile still a student pastor was ordained in the Methodist minis- y in 1900. The next year, he left for Jerusalem to take up the st of superintendent of the American Friends schools. He re- ned home to resume his calling as Methodist pastor, but in 07 joined Smith college as associate professor of Biblical liter- ıre. His other academic posts included professorship of Biblical erature at Haverford college, 1917–38, and directorship of the ıverford college graduate school, 1923–27. Dr. Grant's most ıtable work in the field of archaeology was carried out with the ıverford college expedition at Beth Shemesh, ancient Palestin- ı city, 1928–33. He wrote several volumes on ancient and mod- ı Palestine and on the work of the expedition. Dr. Grant died New York city, Nov. 2.

apefruit.

Production of grapefruit in the United States in 1942 was estimated by the department of riculture as 45,533,000 boxes compared with 40,294,000 boxes in 41 and a ten-year (1930–39) average of 24,383,000 boxes, produced in four states—Florida, Texas, California and izona. Grapefruit juice underwent wartime restrictions Jan. 5, 43, when Food Administrator Claude R. Wickard ordered the tput and canners' supplies of all fruit juices frozen. The order l not apply to retail and wholesale stocks of grapefruit juice. ickard said the action was taken to insure civilian supplies of nned grapefruit juice when supplies of fresh citrus fruits were v. More than half the supply of canned grapefruit juice, he d, would be available for consumers, but the entire production other citrus juices would be reserved for military and lend-lease quirements.

U.S. Production of Grapefruit by States, 1942 and 1941

State	1942 boxes*	1941 boxes*	State	1942 boxes*	1941 boxes*
lorida			California		
Seedless.	8,000,000	7,000,000	Desert Valleys.	1,320,000	1,343,000
Other varieties.	15,600,000	12,200,000	Other varieties.	1,358,000	1,801,000
exas.	16,600,000	14,500,000	Arizona.	2,655,000	3,450,000

Net contents of boxes of grapefruit are 60 lb. in California; in Florida and other tes, 80 lb. (S. O. R.)

Grapes.

The 1942 grape crop in the United States was estimated by the department of agriculture as 2,531,530 tons, 7% less than the 1941 production of 2,728,330 tons, but 13% above the ten-year (1930–39) average of 2,246,271 tons. The California crop of raisin varieties, 1,326,000 tons, was well above the average of 1,157,200 tons, but less than the 1941 crop of 1,516,000 tons. The large 1942 raisin pack was believed sufficient to assure normal supplies to U.S. civilians, although large quantities of raisins were being sent to the armed forces and to lend-lease destinations. California production of raisin grapes in 1942 was 263,000 tons dried and 274,000 tons not dried. (One ton of dried raisins is equivalent to about 4 tons of fresh grapes.) The 1942 crop of wine grapes in California was 537,000 tons compared with 549,000 tons in 1941 and an average of 487,700 tons; table varieties, 437,000 tons in 1942 as against 482,000 tons in 1941 and an average of 345,900 tons.

U.S. Production of Grapes in Leading States, 1942 and 1941

Graphite.

There was little graphite production in the United States after World War I, but the possibility of insufficient supplies of imported material led to some revival in the industry. One plant was put into operation in northern New York, another in Coosa county, Ala., and there was a small output from Rhode Island; in addition, plans were under way for the re-opening of former operations in Chester county, Pa., and near Burnet, Tex. Imports of graphite increased from 31,529 short tons in 1940 to 29,583 tons in the first nine months of 1941. About 10% of past imports were from Chosen, which was in 1942 out of the market, but developments in the eastern area improved the chances of maintaining supplies from Ceylon and Madagascar. Imports from Mexico, which furnished about one-half of the imports, showed a heavy increase in 1941.

Efforts were made to establish new production in Brazil, Portuguese East Africa and South Africa. (G. A. Ro.)

Gravel: *see* SAND AND GRAVEL.

Great Britain & Northern Ireland, United Kingdom of.

This comprises the main island of Great Britain, with numerous smaller islands off the English and Scottish coasts, and the six northeastern counties of Ireland. It is a constitutional monarchy, with a king and a parliament of two houses. Flag, the Union Jack, consisting of a red cross on a white field (for England), surcharged on a diagonal white field (for Ireland), surcharged in turn on a diagonal white cross on a blue field (for Scotland). Ruler: King George VI (*q.v.*); premier in 1942 (since 1940): Winston S. Churchill (*q.v.*); established church: Protestant Episcopal.

Area and Population.—Area 93,991 sq.mi.; pop. (est. Dec. 31, 1939) 47,735,000 (England and Wales 41,417,000). Chief towns (pop. est. June 30, 1938): London (cap.), city and metropolitan

ENTRANCE HALL to one of the eight "super-shelters" constructed in London in 1942. Each shelter has two main twin tunnels about 1,200 ft. long and can accommodate more than 8,000 people

police districts, 8,700,000; city and metropolitan boroughs only, 4,062,800; Glasgow (June 30, 1939), 1,131,500; Birmingham, 1,041,000; Manchester (including Salford), 932,300; Liverpool, 827,400; Sheffield, 520,000; Leeds, 494,000; Edinburgh (June 30, 1939), 473,200; Belfast (Jan. 1, 1939), 443,500; Bristol, 415,000; Hull, 318,700.

History.—The history of the war effort behind the lines in Great Britain—such a country had very little other history in 1942—can best be studied against the background of the war itself (*see* WORLD WAR II). British industrial production attained in 1942 a far higher level than ever before in history; it encroached much further on all other forms of production and reached a larger percentage of the national income than in any other belligerent country except possibly Germany and the U.S.S.R. In fact, the pressure on Britain's resources of manpower and womanpower was rapidly approaching its attainable maximum, and on Aug. 2 the government appealed to all Britons in the U.S.A. to return home to help in the war effort.

Two-thirds of the population between the ages 14 and 65 were enrolled in whole time service in industry, in the forces, or in civil defense. Of those in industry a large proportion were women, of whom there were 5,500,000 in factories. Strikes caused the loss of less than one hour a worker a year.

Some output figures were given by Oliver Lyttelton, minister of production, in the summer of 1942. At that time Great Britain was producing more than 250,000 mechanical vehicles of all kinds in a year and guns—two-pounders and upwards—at the rate of 60,000. Production of aircraft calculated by weight had increased nearly 2½ times in 18 months, and the output of shipyards 57% in the same period. Later, Albert Alexander, first lord of the admiralty, stated that the merchant shipbuilding tonnage production had far outstripped that of the first three years of World War I, while at the same time the very heavy naval losses had been replaced and in certain categories new additions had been made. (*See* SHIPBUILDING.)

Side by side with quantity production the problem of quality production was being seriously tackled. New, faster and more powerful torpedo-carrying aircraft came into production in March, and after the midsummer reverses in Libya, Lyttelton announced the development of much more powerful cruiser and infantry tanks, heavily armoured, as well as of specialized anti-tank weapons far more powerful than the six-pounders which had themselves been an industrial achievement. In certain lines Britain's outstanding successes in output remained unsurpassed, notably in the quality of fighter aircraft, the manufacture of the fastest bombers, and in the development of radio-location, the only decisive weap of war deserving to be called a new "secret weapon."

In order to release manpower for the war effort as well as conserve valuable supplies, further stringent cuts—"austeri measures—were made in civilian consumption. No white bread fancy breads were allowed after April 6; in restaurants the sc of dishes offered and prices charged were strictly regulat "utility" garments designed to save both material and workm ship were widely distributed, and clothing consumption was duced by a 25% cut in coupons. Later furniture and other hou hold necessities were produced on "utility" lines while manufacture of many luxury goods was prohibited altogether a Aug. 1. With the abolition in July of the small basic ration petrol, pleasure motoring ceased. The maximum penalty for bl market offenses was raised to 14 years' penal servitude plus fi that might equal illicit profits.

A measure deeply affecting many business people was the ste concentration of the different trades, involving in many ca the closing down of works or places of business or their use some other aspect of the war effort. It was arranged, howe that the closed works were to be compensated by those remain open. Rationalization of retail distribution was also effec and in the case of dairymen resulted in the consumer being longer free to choose a particular milkman.

Except for milk, which was in short supply during the wi months, food was ample enough during 1942. Though more a cles of food came under control, the "points" rationing system g opportunities for a wider range of choice within prescribed qu tities. Fresh fruits and vegetables were plentiful in the sum and autumn and the harvest, so critical a factor in 1942, good. (*See* AGRICULTURE: *British Empire.*)

In spite of three years of war conditions and a reduction in medical and nursing services available to the general public, health of the nation was fully maintained. Nutrition was pla on a new basis, immunization against disease, especially diph ria, advanced far, and steps were taken to deal with typhus malaria should these diseases gain entry into the country. Th were fewer mental cases. The situation in respect to tubercul was, however, not so satisfactory. There had been a real incre in deaths since the start of World War II, especially among c dren suffering from tubercular meningitis. Another disquie feature was a sharp rise, up to 70%, in the incidence of vene disease. An intensive campaign of enlightenment and preven was undertaken.

In the spring the imminent threat of a serious coal shortage to a government proposal to ration all fuels, but such opposition was encountered over the practical application of cheme that an effort to bridge the gap between production and onsumption was made both by speeding up output at the mines nd by educating the public to exercise the strictest economy. See Coal.)

The coal shortage, the need for conserving gasoline, rubber and ther commodities, and military and industrial priority requireents greatly reduced the volume of transport available to the eneral public in 1942, and while extra trains were being run for orkers and some bus undertakings were carrying 80% to 100% ore passengers, the non-essential rail and road services were reuced to a minimum.

Armed Forces and Home Defense.—Throughout 1942, preparaons to meet the threat of invasion or of a new bombing offensive ontinued. Despite the dispatch of large armies overseas a conderable number of troops remained in Britain, some—the less fit—permanently assigned to home defense, others still in training. Vith a view to raising the standard of officers, those over 45 who iled to reach a requisite standard of efficiency were retired. or the ranks a new system of adult education comprised a four onths' course of instruction on Great Britain, the empire, the lied nations and economic geography. Monetary post-war credits ere introduced, and on Sept. 11 the financial position of junior ficers up to but not including the rank of captain was improved y a more rapid system of promotion, while all other ranks reived an increase in basic pay to 7*s.* instead of 3*s.*6*d.* a week for en and 2*s.*4*d.* for women. In both cases allowances for children ere increased. A proclamation on Oct. 22 made men who had ached 18 that day liable to be called up. Those who had reached between July 1 and Sept. 30 registered on Nov. 7. This did not fect the minimum age, 19, at which men were posted for service broad. A proclamation of March 5 had already extended the Naonal Service act to men of between 41 and 45. An important velopment was the formation of an R.A.F. regiment for the dense of aerodromes.

Many new contingents arrived from Canada during 1942, and om June onwards United States forces were in Britain as well as Northern Ireland. One of the biggest emergency tasks ever ndertaken by British builders was the rapid construction of aeroomes, camps and port facilities for these forces. By a bill ssed in the house of commons on Aug. 4, U.S. troops became bject to their own courts martial and not to British civil courts all criminal charges.

Certain military districts in Britain were permanently barred the public. Other areas were banned in the summer to all but sidents and their close relatives. Invasion committees were set in many districts, while a defense regulation made all civilians danger areas liable for labour but not for military service in e event of an invasion. Compulsory fire guard was extended to omen between the ages of 20 and 45. The Home Guard was ought within the conscriptional system, and liaison with the vilian defense service was greatly improved.

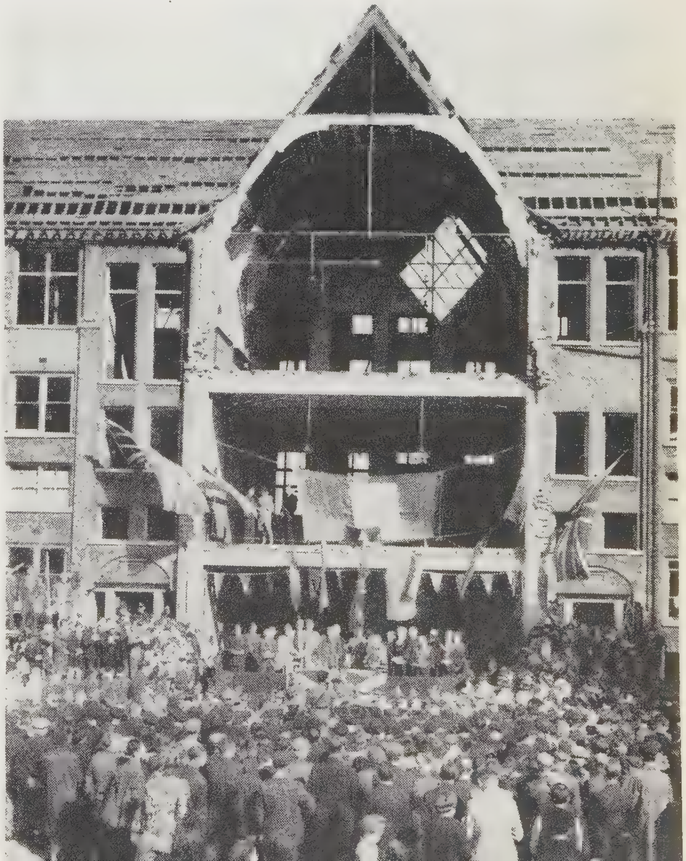
Air Raids.—Enemy activity over Britain was less than in 1941. here were "hit and run" raids on coastal areas and on a few innd towns, and in April "reprisal" raids for the British attacks Rostock and Luebeck damaged historic buildings in Norwich, xeter, Bath and York. Further reprisals after the shattering ids on Cologne and Essen in which more than 1,000 R.A.F. ombers took part were aimed at Canterbury and "Ipswich port." hese "Baedeker raids" were conducted for the most part by nall numbers of bombers whose percentage losses were high, and vilian casualties were not heavy.

Parliament.—Inevitably parliamentary proceedings during 1942 ere largely determined by the course of the war. Legislation as mainly concerned with vigorous prosecution of the war, with atters affecting the services and with the regulation of civilian activities. Many important war debates took place. At the first of these, beginning on Jan. 27, shortly after his return from the U.S.A. Churchill asked for a vote of confidence and received the reassuring majority of 464 to 1. Nevertheless the house of commons was critical and in February he re-organized his government, still retaining for himself the offices of prime minister, minister of defense and first lord of the treasury. The loss of Singapore evoked many demands for a full-dress enquiry, but after Gen. Bennett's report had been received it was announced that an investigation would not be in the best interests of the conduct of the war. A full debate on the campaign in Libya was, however, held on July 1 in both houses, and once more the house of commons re-affirmed its confidence in the government, this time by defeating a vote of censure moved by Sir John Wardlaw Milne, a conservative member, by 476 to 25.

All through 1942 a necessary veil of censorship was drawn over one of the major issues of the war, the shipping situation, which was debated in both houses on July 16 in secret session. For public consumption Churchill announced in February that following the Japanese entry into the war losses had been heavy, and in March that the battle of the Atlantic, after having been markedly in British favour for five to six months, had temporarily worsened. July and August proved, however, to be the most successful months in U-boat destruction, with new methods of combat developing and new devices in action, and shipping losses for August and September were the least since January.

The problem of the future status of India was one of the most discussed topics during 1942, and it was with the deepest regret that both houses learned of the non-acceptance by Indian leaders of the proposals put forward by the British government in the Draft Declaration of Discussion. In many subsequent pronouncements and again in the address from the throne on the opening of the new session of parliament Nov. 11, Britain's desire for the independence of India within the framework of the British Commonwealth of Nations was re-affirmed. It was made amply

THE SECOND ANNIVERSARY of the battle of Britain was observed on the site of a bombed school in East London in Sept. 1942



clear that the door still remained open for negotiation. (*See* INDIA.) Events and future developments in the colonial empire were also under discussion, and on June 24 a vigorous debate took place in the house of commons on the best means of carrying out Britain's declared policy of preparing the colonial people for self-government and full partnership in the British empire. Then and later the formation of a Colonial Development board, with statutory rights and adequate funds, was pressed as a means of expediting the process. On Oct. 21 General Smuts, premier of South Africa, addressed a joint assembly of both houses.

On Nov. 23 the prime minister announced ministerial changes and again re-organized his cabinet. (*See* CABINET MEMBERS; PARLIAMENT, HOUSES OF.)

The Budget and Finance.—In presenting the budget on April 14, Sir Kingsley Wood stated that the maintenance of stable prices during the previous financial year had cost the exchequer £125,000,000, and would probably cost more during the succeeding year. The estimated taxes on the existing basis of taxation fell short of the revenue target by £150,000,000, and therefore new duties on tobacco, spirits, wines and beer, and the doubling of the entertainments tax and the purchase tax were introduced to meet the deficit. The income tax, which in 1942 had reached the basic rate of 10*s.* in the pound, with super-tax rising in the highest ranges to 19*s.* 6*d.*, was unchanged except for a small concession to married women, raising the maximum allowance on their earnings from £45 to £80. This budget, with its twofold purpose of raising revenue and decreasing consumption, was approved as likely to aid the government's policy of avoiding inflation by restricting consumption and increasing savings. By Nov. 22, over £4,500,000,000, including £1,000,000,000 from war weapons and warships weeks, had been invested in national savings.

On Oct. 20, the chancellor of the exchequer asked for a further note of credit of £1,000,000,000, making a total of £12,050,000,000 since the beginning of the war. The daily average expenditure on the war by October had risen to £12,750,000,000.

Foreign Relations.—Greater unity among the allied powers was heralded by a joint declaration in Washington on Jan. 1, 1942, of common aims and purposes and a further joint declaration in London on Jan. 13 emphasizing Germany's war guilt and the intention that all infringements of international law and barbarous acts committed by the axis powers should be duly punished. Feeling on this subject intensified with fresh revelations of "terrible reprisals of unbelievable bestiality" against the peoples of occupied Europe, of Japanese atrocities at Hongkong and Singapore, and of the manacling of prisoners taken at Dieppe.

Relations between Britain and the U.S.A. were considerably strengthened by a continual exchange of visits for consultation purposes between statesmen, service chiefs and technicians. Winston Churchill was in Washington in Dec. 1941 and again in June 1942. From the latter visit to President Roosevelt resulted, it was later revealed, preparations for the North African campaign of Nov. 1942. From the former came plans for the complete co-ordination of the allied effort regarding munitions assignments, shipping adjustments and raw materials. On Feb. 23 the Lend-lease agreement was signed. On June 9 the formation of an Anglo-American combined production and resources board and an Anglo-American food board were announced. In September an exchange of notes set out in full the principles of reciprocal aid in the prosecution of the war against aggression, while later an exchange of inventions was arranged. On March 10 an Anglo-American commission to strengthen social and economic cooperation in the Caribbean outposts was established.

Further steps towards close rapprochement with the U.S.S.R. (*q.v.*) were also significant. Aid to that country was so steadily maintained that in May Clement Attlee, deputy prime minis
was able to announce that in spite of her own crying needs B
ain had fulfilled all her promises as regards war materials.
route through Iran was developed ahead of schedule, and in J
Britain granted a further credit of £25,000,000 to Russia for
purchase of supplies. On Nov. 12 came the news that in
year ended Sept. 1942 Britain and the U.S.A. had dispatched
the costly northern route 3,052 aircraft; 4,084 tanks; 831,
tons of miscellaneous supplies including machine tools and
materials; 30,031 vehicles; 42,000 tons of aviation fuel,
66,000 tons of fuel oil.

Aid to China by Britain became difficult after the loss of
Burma road, but a large loan for war purposes was offered
the Chinese government in February. In October Britain
the United States undertook to relinquish all extra-territo
rights in China.

Relations with other friendly powers were marked by the s
ing of the Anglo-Soviet-Iranian treaty (*see* IRAN); of an ag
ment and military convention with the emperor of Ethiopia (
ETHIOPIA); and of agreements with the Greek prime mini
and the Netherlands foreign minister respectively over the
and status of their armed forces. Notes exchanged with the Cz
government made it clear that H.M. government would not
influenced in any post war settlement by frontier changes effec
since 1938. (D. C. So.; X.

Greece.

A kingdom in the southern part of the Balkan peninsula, under German, Italian and Bulgarian occupation in 1942. Area 50,147 sq.mi., of which 41,328 are mainland; pop. (census May 16, 1928) 6,204,684; (estimated, 1940) 7,150,000. Capital, Athens (392,781). Chief cities: Thessaloniki (236,524), Patras (61,278), Cavalla (49,980), Candia (33,404), Corfu (32,221). Religion: mostly Greek Orthodox; 126,017 Mohammedans; 72,791 Jews. King: George II; prime minister (1942): Emmanuel Tsouderos.

History.—Little authentic news came out from Greece in 1942 except repeated and well-substantiated reports of starvation. It was estimated that Greece needed at least 30,000 additional tons of grain monthly for keeping the population alive. With the help of Great Britain and the United States the Turkish Red Crescent delivered food and medical supplies, yet this was not sufficient.

Food was not only extremely scarce but obtainable only at highly-inflated prices.

The Greek government in exile put itself on a new basis when on Feb. 2, 1942, King George II ended the dictatorship begun Aug. 4, 1936. The minister of labour, Aristides Demetratos, who had started as a communist and later turned fascist, left the cabinet. On May 3 the cabinet was completely reconstituted. Prime Minister Tsouderos took over the navy, air and war portfolios, and Professor Panayotis Kannelopoulos, leader of Greek resistance to fascism and to the axis, became vice-premier.

The Greek government signed on Jan. 15 an agreement with the Yugoslavian government in exile concerning future closer collaboration between the two countries in foreign policy, military establishment, customs, economic organization and communications.

Education.—Education was compulsory for all children between the ages of 7 and 12. In 1938 Greece had 743 kindergartens with 38,338 pupils, 8,339 primary schools with 985,018 pupils and 407 high schools with 92,687 pupils, of whom 28,998 were girls. There were five institutions of higher learning, among them 3 universities with 7,230 students, of whom 845 were women, an institute of technology with 521 students and a school of fine arts.

Finance.—The monetary unit was the drachma, which had been stabilized in 1928 at 77.02 to the dollar; the stabilization was suspended in April 1932. For the year 1939–40, the revenue was estimated at 14,014,000,000 and expenditure at 14,653,000,000 drachmai. The public debt amounted on Dec. 31, 1938, to 52,140,000,000 drachmai. On Dec. 31, 1939, the bank-note circulation was 9,453,000,000 drachmai, and the total gold in the national bank amounted to 4,223,000,000 drachmai.

Communication and Trade.—Greece had an important merchant marine which consisted on June 30, 1939, of 589 steam and motor ships of 1,812,723 tons and 710 small sailing vessels. There were, in 1939, 1,668 mi. of railroad and 42 telephone exchanges with 38,427 subscribers. There were 1,368 post offices at the end of 1937.

The value of imports amounted in 1940 to 12,215,000,000, the value of exports to 9,079,000,000 drachmai. In 1940 Germany was first in both imports and exports and the United States second. Chief articles of export were currants, raisins and tobacco, of imports cotton piece goods, woollen goods and machinery.

Agriculture and Mineral Production.—Greece is chiefly an agricultural country, although the mountainous character allows only one-fifth of the area to be cultivated. Chief crops are wheat, wine, barley, currants, maize, oats, tobacco and cotton. Olive and fruit are produced in great quantities and good quality. Breeding of sheep and goats is important. The principal minerals found are iron ore, iron pyrites, magnesite, lignites, chromites, lead, emery. Industrial development was growing before the axis invasion of 1941. (H. Ko.)

Greenland.

The world's largest island (736,518 sq.mi., some 705,000 covered by glacier), in the North Atlantic ocean, N.W. of Iceland. A Danish possession, it came under United States protection in 1941. Capital, Godthaab. A population of about 18,000 (est. 1941) is scattered in small settlements on the west coast, and 1,000 on the east coast, about 600 in all being Danes, the rest native Greenlanders. Seats of the governors are Godhavn in the north and Godthaab in the south.

History.—Through 1942 Greenland continued under the regime established by the agreement of April 9, 1941, between the Danish Minister in Washington, Henrik de Kauffmann, and Secretary of State Cordell Hull. The continuance of Danish sovereignty was recognized; the United States obtained the right to build bases for planes, radio and weather stations, and to maintain them by "any and all things necessary"; the agreement to stand "until the present dangers to the American continent have passed." Actual administration in Greenland remained in Danish hands as before.

Any U.S. doubts about the wisdom and the necessity of this move had vanished by the beginning of 1942, and de Kauffmann, though of course disavowed and dismissed, stayed on in Washington. Significantly, the Danish government found it legally impossible to confiscate the minister's property in Denmark.

The significance of Greenland in the military situation was based primarily on two geographic factors: (1) The location there of the world's only cryolite mines, ore vital in the manufacture of aluminum, and which in 1942 was taken from Greenland to Canada and the United States in quantity sufficient to pay for all the country's necessary imports; (2) The location on "Greenland's icy mountains" of the source of much of the weather conditions and weather reporting for the North Atlantic and much of Europe. By possession of meteorological stations there, the United Nations were enabled to plan their operations much more effectively than would otherwise be possible—and Germany was at the same time deprived of the opportunity of forecasting accurately the weather even over western Europe.

A trade revolution on a small scale had to be carried through in Greenland, because Denmark had maintained there a strict trade monopoly—for the protection of the natives. With the closure of the route to Copenhagen, new associations had to be created with the United States.

On Oct. 16, 1942, the British government acknowledged acceptance of a gift of 40,000 kr. (about $10,000) from the people of Greenland, given to aid in freeing the motherland—Denmark. Though not stupendous in amount, the gift was heartening Danes, and was perhaps some confirming evidence for Mich Spender's statement that "The Danish administration of Gre land is the most brilliant example of colonial administration."

Trade and Finance.—Exports (largely fish and fish produc in 1939 totalled 1,847,000 kroner (1 krón = 18¢ U.S. in 193 exclusive of export of 56,455,300 kg. of cryolite. Imports in 1 totalled 4,149,000 kr. and consisted chiefly of foodstuffs (607, kr.), wood (468,000 kr.), manufactures (451,000 kr.), fruits a other colonial wares (389,000 kr.), meat (253,000 kr.).

The government budget for 1939–40 was balanced at 6,035, kr. (F. D. S.)

Guam.

A possession of the United States of America and largest and most populous island of the Marian Guam lies at the southern end of that group, approximately 1, mi. E. from Manila; area about 225 sq.mi.; population, July 1941, 23,394, including 21,994 natives called Chamorros; the mainder are foreign-born or personnel of the naval establishme Agana, with a population of 11,000, is the capital and only c of Guam, which was occupied by Japanese forces in Dec. 1941.

History.—The island was discovered by Magellan March 1521, and remained a Spanish possession until June 21, 18 when it was captured by the United States. Later it was ceded the United States by the treaty of Paris, and after its acquisit was under the jurisdiction and control of the navy departme with a naval officer, commissioned as governor by the preside acting as chief executive of the island.

Guam was attacked from all sides by Japanese naval for Dec. 8, 1941 (Dec. 7 east of the international date lin It was defended by a small force of approximately 555 U sailors and marines, plus a group of some 1,100 construct workers who seized whatever weapons were at hand. The Japan made a landing near Agana Dec. 10 and claimed control of island shortly thereafter. The U.S. navy department ackno edged loss of the island Dec. 13, 1941. No information regard the Japanese occupation issued from the island during 1942.

Education.—During 1940–1941 the public schools had average enrolment of 5,082. All instruction was in the Eng language, with special attention given to health and sanita and to industrial and agricultural training. Health and sanit conditions are very satisfactory.

Agriculture.—Typhoon damage to the coconut crop curta copra export to 193,391 lb. for the fiscal year 1940–41; the va was $73,763. Total exports were $84,278; imports, $994, Guam is an agricultural community; soil is fertile and na foodstuffs plentiful.

Guatemala.

The most northerly republic of Central Amer Area, 42,364 sq.mi.; pop. (1941 est.): 3,384, Two-thirds of the population are Indians, the rest largely mes By far the greater number live in the southern third of republic. Capital, Guatemala City (167,000); other cities Quezaltenango (26,100); and Antigua (12,300); population mates for these and other cities vary widely. Official langua Spanish. President in 1942: General Jorge Ubico.

History.—Guatemala continued her policy of inter-Amer co-operation during 1942. Axis property was taken over by government, with a special tax levied on it for defense purpo In order to maintain coffee production at normal levels, pla tions owned by axis nationals were continued in operation under the direction of the Central Bank of Guatemala. President Ubico ordered the establishment of a civil guard, to be made up of men 50–60 years of age, the purpose being to combat subversive activities. One of the largest military airports in Latin America was built in Guatemala, and United States patrol bombers operated from there. The president also ordered a cessation of importation of all United States currency, to prevent use by axis agents.

The government established gasoline and tire rationing in July, stocks having been frozen earlier in the year. Price ceilings were set for imported articles where shortage appeared imminent, and rent control was established in May.

Education.—Elementary school enrolment for 1940–41 was 144,985; secondary school enrolment was 1,000. There were 1,634 national elementary schools, and 833 private schools. Secondary schools numbered 16, in addition to the National university.

Defense.—Guatemala had a regular army listed as numbering 7,000 at the start of World War II; it was steadily increased from the reserve in 1942.

Finance.—The monetary unit is the quetzal, maintained at parity with the United States dollar. The 1942–43 budget was balanced at $10,033,000 (less than for 1941–42, during which revenue had decreased over $500,000). Currency in circulation (1941) was approximately $22,000,000 with reserves in the central bank reported increased. The public debt (Dec. 31, 1941) was $3,967,799.99.

Trade.—Imports for 1941 were valued at $16,098,907, an increase in value over the previous year of $900,000. Exports: $14,502,803 (up $2,500,000). Coffee amounted to approximately 60% of all exports, bananas approximately 30%. Guatemalan trade suffered in 1942 through lack of shipping space, a loss partly offset by improved rail connections with Mexico.

Communication.—The completion of the Suchiate bridge in Feb. 1942 improved rail connections with the north, of importance after external communication by water was curtailed. Air service was increased in 1942. Railroad mileage: 600 mi. public; 280 mi. private. Highway mileage: 3,700 mi., with 650 mi. under construction.

Agriculture.—Main export crops are coffee (average export to U.S. 558,500 bags), bananas and chicle (1942 crop est. 3,000,000 bales). The quota limitation on coffee set in 1941 was removed because of the shortage in amounts reaching the United States. (*See* also BRITISH HONDURAS.)

Guggenheim Memorial Foundation. The John Simon Guggenheim Memorial foundation granted 101 fellowships, with stipends totalling $240,000, for the year 1942–43. Of these awards, 77 went to the fellowship program of the United States, 4 to that of Canada, and 20 to the program of Latin America. Since its establishment in 1925 by Simon Guggenheim and his wife, the foundation had, by 1942, contributed $2,531,400 in the form of 1,223 fellowships to the advancement of research in all fields of knowledge and creative work in the arts.

At the time of the death of Guggenheim in 1941, the foundation, already having an endowment of $8,415,131, became the residuary legatee of almost his entire estate. All contributions had been made by the co-founders. Headquarters of the foundation are at 551 Fifth avenue, New York city.

Gustavus V (1858–   ), king of Sweden, of whom a biographical account will be found in the *Encyclopædia Britannica,* ascended the throne in 1907, and years before 1942 had attained the rank of Europe's oldest living monarch. In 1938 the nation-wide celebration of his 80th birthday was a testimonial of love and respect and a demonstration of deep-seated national unity. The king's tennis and bridge continued, but winters on the Riviera had to be abandoned from 1939 on; in 1942 "Mr. G" stood not only as the personification of a nation's neutrality, but as a firm, steady guide through the storms that engulfed all Sweden's neighbours. He was a conspicuous leader in movements for Scandinavian peace and solidarity, and his very presence seemed to convey some hope for the future.

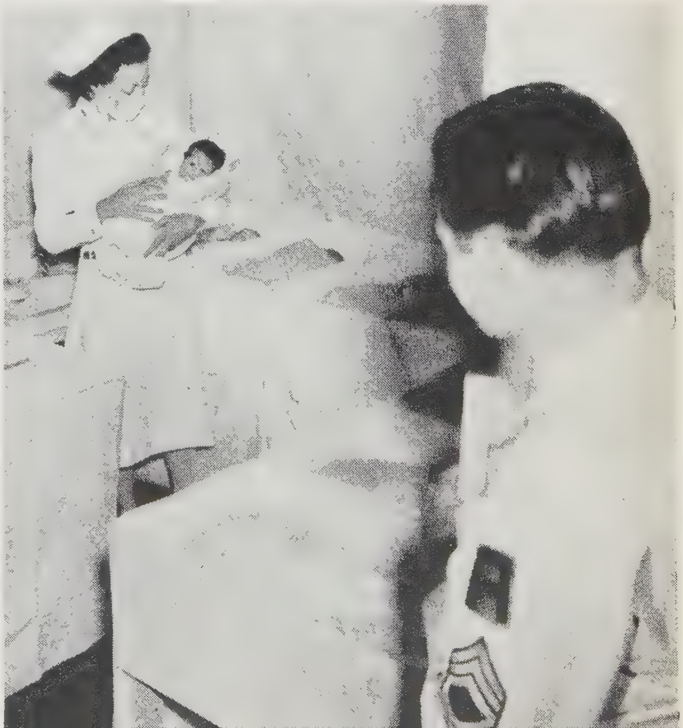
(F. D. S.)

Gymnastics. Nationwide stress on physical fitness added new interest to the A.A.U. gymnastic championships of 1942, held at Western Reserve university in Cleveland. With three 1941 champions in the armed services, only Temple university's George Szypula, in tumbling, repeated his title conquest of the previous year. The Swiss Gymnastic society of Union City, N.J., led by All-Around Champion Arthur E. Pitt, won the team championship with 60 points. Penn State was second with 39. Pitt placed first in the calisthenics, long horse, horizontal bar; was tied for first in the parallel bars; and placed second in the flying rings and side horse. Caton Cobb of the University of Illinois was the leading collegian in the all-around competition.

(M. P. W.)

Gynaecology and Obstetrics. Maternal mortality statistics are always one to one and one-half years old when compilation is complete and the figures become available. The decade from 1930 to 1940

IMPROVISED NURSERY of a U.S. army camp. Obstetrical care and delivery rooms were available to the wives of U.S. soldiers in 1942, but soldiers had first call on hospital facilities



showed a decrease in maternal death rates from 6.7 per 1,000 live births to 3.76 in the United States. The rate for 1941 shows a further decrease to 3 per 1,000. Large cities generally have considerably lower rates than rural communities or smaller populated centres. The 1940 average for 27 major cities of the United States was 2.84 per 1,000.

The contrast between methods of analgesia and anaesthesia during labour and delivery in Great Britain and in North and South America was noteworthy. Griffith and Goodall, after an extensive study of English methods, utilized opium derivatives in the first stage, nitrous oxide and oxygen in the second stage, completing delivery with chloroform or cyclopropane. In North America barbiturates were extensively used for analgesia in first stage, followed by rectal administration of Gwathmey's ether-alcohol-olive oil mixture with the addition to this of paraldehyde, delivery being completed under nitrous oxide or ether anaesthesia. Local "block" of perineal nerves was also popular. In South America, León reported that pentobarbitol sodium is superior to other drugs as an amnesic but that this alone is successful in producing analgesia-amnesia in only about one-third of all cases.

Vitamin deficiencies and the effects of these related to obstetric and gynaecologic disorders continued to produce a voluminous literature. Deficiency in vitamin A was viewed as lowering resistance against infection; that of vitamin B was held responsible to some extent for neuritis and for emesis gravidarum. Insufficient vitamin C intake seemed to be related to anaemias of pregnancy; vitamin D was considered essential to proper calcium metabolism. Vitamin E deficiency was held to be a responsible factor in sterility and repeated abortions. Vitamin K was accepted as having an important function in maintaining prothrombin levels in the pregnant woman and therefore in preventing certain types of haemorrhagic disease of the newborn.

Williams and Fralin investigated the diets or food habits of a group of 514 pregnant women in respect to the adequacy of the vitamin contents of these, and found them woefully lacking. They concluded that obstetricians should give more specific instructions to each such individual with particular emphasis on milk, citrus fruits, leafy vegetables, eggs, meat, butter, bread and whole grain cereals.

The use of sulpha derivatives in puerperal infections kept pace with their use in other fields of medicine. An ingenious suggestion was that of Anderson and his co-workers; namely, that gauze impregnated with sulphanilamide (or a suitable derivative) be used for packing in instances of infected abortions, or suspected infection of the uterus after delivery. They made bacteriologic studies by means of culture balls embedded in such packing material.

The use of sulphathiazole powder sprinkled into infected operation wounds, such as Caesarean section after neglected labour, or septic gynaecologic cases, was accepted practice.

Further light was thrown on the cause, prevention, and treatment of that haemorrhagic disease of the newborn termed erythroblastosis neonatorum. Javert was still a pioneer in this work, but many others studied and wrote about this in 1941–42. It appeared that this condition, so often fatal to newborn infants, is dependent on the Rh factors discussed from a viewpoint of dominant Mendelian characteristics inherited from the parents. The mother, for example, shows an Rh−, the father Rh+, with the infant Rh+. The transmission of Rh agglutinogin from foetal circulation into the maternal circulation may result in an isoimmunization of the mother. Formation of antibodies in the mother with their passage through the placenta into the foetal circulation are presumably responsible for red cell haemolysis and other foetal symptoms. Treatment consisted in repeated transfusions always using a donor with the same Rh as that of the infant, thus excluding its mother, plus the use of vitamin K. T latter was given routinely, by some authorities, to all babi showing jaundice, intracranial haemorrhage, or even because prematurity since this predisposes to intracranial haemorrhage.

In answer to the question often posed, as to why women not lactate during pregnancy but begin to do so shortly after t uterus is emptied of the gestation, whatever the stage of th latter may be, Turner and Meites explained that the placen produced a suppressing agent holding lactation in abeyance, whi progesterone and large amounts of oestrogen common to pre nancy likewise exerted a similar effect. Sudden removal of the inhibitions, supplanted by the appearance of lactogenic hormo from the anterior lobe of the pituitary, low during pregnancy a increased two to four times in amount immediately thereaft were, according to them, responsible for the onset of lactatic

Pulmonary embolism is responsible for approximately 6% deaths after major operations as well as being a prominent cau of postpartum deaths. Heparin, a blood anti-coagulant, was ut ized successfully in patients having emboli not immediately fat Purified non-toxic heparin was produced independently by Charl and Scott, working with Best in Toronto, and by Schmitz a Fischer in Germany. The continuous intravenous administrati was preferred in Canada and the United States, as contrast with the Scandinavian technic employing repeated single jections.

The *Journal of the American Medical Association* of Nov. 1942 contained several articles and editorial comment on an prothrombic therapy by use of "dicoumarin," or an extract fr spoiled sweet clover. Cattle feeding on such fodder develop haemophilic condition; the essential substance was extract analyzed and reproduced synthetically, and was about to offered as a treatment for thrombosis and embolism.

Gypsum. Mine production of gypsum in the United Stat in 1941 increased by 19% over 1940, to 4,788, short tons, but combined sales of domestic and imported go were even higher. Sales of crude gypsum increased 40% 1,320,713 tons, and of calcined gypsum 20% to 4,438,754 to Since total imports for the year were not reported, it is not kno whether the increases of sales over production came from creased imports or from stocks. The manufacture of portla cement took 87% of the crude, and agriculture 11%. The u of calcined gypsum made some marked changes from the p ceding year, as indicated by the following percentages, those the preceding year being given in parentheses for compariso building plasters 44% (53%); wallboard and sheathing 1 (12%); lath 31% (28%); tile 4% (4%). All told, the build industry consumed 97% of the calcined gypsum and 87% of crude. During the first three-quarters of 1942 the production crude gypsum increased only 5% over the same period of 19 to 3,514,500 tons, while sales decreased to 2,891,000 tons. T drop was presumably due to restrictions on private build operations.

Canada made a new record high in gypsum production in 19 with 1,590,312 short tons, a 10% increase over the previous h ade in 1940, but production during the first half of 1942 dropped ore than a third below the same period of 1941. (G. A. Ro.)

aakon VII (1872–), king of Norway, of whom a biographical account will be found in *Encyclopædia ritannica,* was born Prince Charles of Denmark, second son of rederick VIII (and brother of Christian X). Upon the sepa tion of Norway from Sweden he was elected king by the orwegian Storting (Nov. 18, 1905), and took the old Norse me of Haakon, and that of Olav for his son the crown prince. aakon married Maud (1869–1938), youngest daughter of King lward VII of England.

The unanimous loyalty of Norwegians to their exiled king ter 1940 was more than a sign that their land was in trouble. aakon's personal bravery and uprightness, his nonpartisan na nalism, his zealous industry, his dignified acceptance of neces y while fighting vigorously for the independence of his people, gave rich meaning to the motto he had chosen in 1905: "All r Norway." Through disillusionment, bitterness, distress from 40 through 1942, the Norwegian people both at home and road, on land and sea, had one rallying point. This sentiment und expression from all corners of the earth on the king's th birthday, August 3, 1942. (*See* also NORWAY.) (F. D. S.)

ackett, Charles (1889–1942), U.S. opera singer, was born Nov. 4 in Worcester, Mass. He gan his singing career with a high school glee club, then studied Boston, Mass., and in Florence, Italy. In 1915, he made his eratic debut in *Mephistopheles* in Pavia, Italy, and afterwards led engagements in Genoa, Milan, Italy and Buenos Aires, gentina. In 1919, he made his American debut at the Metro litan in New York City as Count Almaviva in *The Barber of ville.* He was with the Chicago Civic Opera company, 1923–33 d then rejoined the Metropolitan. Hackett died in Jamaica, ieens, N.Y., Jan. 1.

iti. A republic occupying the western third of the West Indies island of Hispaniola. Area, 10,700 sq.mi. Pop. imates in 1942 varied from 2,600,000 to 3,000,000, with the ter figure usually quoted. Capital, Port-au-Prince (110,000). her cities: Les Cayes (15,000); Cap Haitien (20,000); naïves (12,000); Jacmel (10,000). Official language: French; icial religion: Roman Catholic, with the lower classes practis g the folk religion of vodun or voodoo. President in 1942: Elie scot.

History.—Haiti was active in carrying out inter-American col oration during 1942. Suspension of the constitutional guar tees was extended for the duration of the war. All Haitian izens outside the state were ordered to return, and all males –40 were required to register in January. Enemy property was ntrolled, as was the movement of United States currency. A fense tax of $1 on each bag of the 1942–43 coffee crop was ied to finance defense measures. In March–April Pres. Lescot ade a trip to Washington.

Complete governmental regulation of automobile, tire, and soline sales took place early in the year. Price and export con ol was established, and a special commission was created to pervise the production and sale of rice. Cotton production was led by a United States guarantee to purchase surplus amounts; ial production was also encouraged. The rubber production ogram involved the planting of 100,000 ac. to Cryptostegia ants, with the United States financing the plan.

Education.—Statistics on Haitian education, admittedly mis ading since enrolment does not mean attendance, indicated some o schools with 500,000 in attendance in 1942. In the 1941 budget, education was allotted 2,383,828 gourdes. Study of the English language became compulsory Oct. 1, 1942.

Defense.—The Haitian constabulary numbered approximately 3,000, aided by a rural police force of 550. A department of national defense was created in 1942.

Finance.—The monetary unit is the gourde, fixed by law at 20 cents U.S. Revenue (for fiscal year 1941–42); $5,119,851; expenditures: $5,545,232. In 1938–42 the Export-Import bank had extended Haiti five credits totalling $12,500,000. The public debt (Aug. 31, 1942) was $14,203,000.

Trade.—Haitian imports for the 11-month period ending Aug. 31, 1942, were $7,541,800, an increase of 13% over the same period in the previous year. Imports were mainly from the U.S. (85%), and consisted largely of textiles, manufactures, and foodstuffs. Exports for the same period were $6,940,800.

Communication.—Haiti has external communication by sea and air, and because of her strategic location suffered less in loss of service than other Latin American states. Internal communication is poor, with about 160 mi. of railroad and 1,500 mi. of highway in 1942.

BIBLIOGRAPHY.—Harold Palmer Davis, *Black Democracy* (1929); James Graham Leyburn, *The Haitian People* (1941); Chester Lloyd Jones, *The Caribbean since 1900* (1936). (D. Rd.)

Halder, Franz (1884–), German army officer, started his army career as standard-bearer in a Bavarian artillery regiment and served as general staff officer, 1915–18. He was next attached to the office of the war ministry. General Halder was one of the early members of the nazi party at a time when other high-ranking army officials kept aloof from Hitler. In 1936 he became a lieutenant general and later that year chief of general staff. Considered by many as Hitler's No. 1 strategist, he was said to have planned the Polish campaign, the blitzkrieg against France in the west, and the initial drive into Russia in 1941. Never one to bow before der fuehrer, General Halder was said to have talked sharply to Hitler and to have disagreed with him on several occasions on the conduct of the war, especially on a winter campaign in Russia and an invasion of England. He was passed up when Hitler bestowed the rank of field marshal on several of Halder's colleagues. Halder was a close friend and associate of Marshal von Brauchitsch and his chief of general staff until the latter was deposed in Dec. 1941. A month after Halder had been appointed to carry out plans for a second hard winter campaign in Russia, rumours in late Oct. 1942 carried news of his dismissal. A dispatch on Dec. 10, 1942, confirmed Halder's ouster and revealed that he had been succeeded by Gen. Kurt Zeitzler.

Halifax, Edward Frederick Lindley Wood, 3RD VISCOUNT (1881–), British statesman. See *Encyclopædia Britannica* for his biography. On Feb. 25, 1938, he succeeded Anthony Eden as foreign minister and retained this post through the "Munich era" and through the various reshufflings of the war cabinets of Chamberlain and Churchill. On Dec. 23, 1940 he was named British ambassador to the United States, and presented his credentials Jan. 30, 1941. On March 25 he listed as one British war aim world-wide economic co-operation and political freedom after the axis' defeat.

In June 1941 he received honorary degrees from Columbia, Harvard and Yale universities. Later he made an inspection tour of aircraft plants on the U.S. west coast. On Jan. 1, 1942 Halifax conferred with Roosevelt, Churchill and British and U.S. military chieftains on war problems. He went to London in July for parleys with King George VI and Eden and returned to the U.S. in August.

Halsey, William Frederick, Jr. (1882–), U.S. naval officer, was born Oct. 30 in Elizabeth, N.J. After graduating from Annapolis in 1904, he was assigned to destroyer duty and commanded a destroyer force that patrolled waters around Queenstown, Ireland, during World War I. After the war, he served as commander of the aircraft carrier "Saratoga," then as commandant of the Pensacola naval air station. He was made a rear admiral and commander of a carrier division in 1938, organized squadrons for the aircraft carriers "Yorktown" and "Enterprise," and was promoted to vice-admiral in June 1940. During World War II, Admiral Halsey led the successful naval and air raid against the Japanese-held Pacific bases on the Marshall and Gilbert Islands on Jan. 31–Feb. 1, 1942. At a critical juncture in the battle for control of the Solomon Islands, Admiral Halsey relieved Vice-Admiral Robert Lee Ghormley on Oct. 24, 1942 as commander of U.S. naval forces in the south Pacific. Three weeks later, on Nov. 13, Admiral Halsey engaged a large Japanese force of warships off the Solomon Islands in a three-day battle. Although outnumbered, his fleet emerged victorious, and sank a total of 28 Japanese warships, including at least one battleship, eight cruisers and six destroyers. In recognition of this achievement, he was promoted to full admiral on Nov. 20, 1942, and was awarded the congressional medal of honour the following month.

Hamilton, Cosmo (1872?–1942), British author and brother of two well-known writers, A. Hamilton Gibbs and Sir Philip Gibbs, took his mother's name when he began to write. At the height of his career, Hamilton produced a book a year, and many of his plays were box-office hits. During World War II, he was on the staff of the ministry of information. Among his novels are *Brummell* (1912), *The Blindness of Virtue* (1912), *His Friend and His Wife* (1920), *Caste* (1925), *The Three Passions* (1928) and *Discord and Harmony* (1938). He died at Shanley Green, Surrey, Oct. 14.

Hammer Throw: *see* Track and Field Sports.

Hand-ball. Despite the curtailment of activities due to the war, the annual hand-ball classic was held in 1942 in San Francisco's Olympic club. The seven-time national champion, Joseph Platak, was unable to compete because he was in military service, and his annual runner-up, Jack Clements, of the Olympic club, achieved the long sought for honour by capturing the singles title. The champions in doubles, Frank Coyle and Edward Linz, of the New York Athletic club were also, for war-work reasons, absent, and their archrivals Joe Gordan and Joe Goldsmith of Long Beach, Calif. captured first honours.

National Four-Wall Rankings for 1942

Singles	*Doubles*
1. Jack Clements, San Francisco	1. J. Gordon and J. L. Goldsmith, Long Beach, Calif.
2. Dan Marble, San Francisco	2. J. Capell and Roy Leu, San Francisco
3. Angelo Tochinni, Oakland, Calif.	3. M. De La Pena and E. Henrich, San Francisco

Continued interest was manifested in the one-wall game which is played almost exclusively in the east. New York city has been the scene of all the national tournaments in this branch of the game and is considered to have the best players in the U.S.A.

National One-Wall Rankings for 1942

Singles	*Doubles*
1. Joseph Garber, New York	1. M. Ornstein and V. Herschkowitz, New York
2. Morton Alexander, New York	2. J. Garber and N. Shinkarik, New York
3. Victor Herschkowitz, New York	3. L. Block and A. Wolfe, New York

Women's Rankings (One-Wall, New York Metropolitan District)

1. Mrs. Lucy West	2. Marie Zannetti	3. Madeline Maus

Harper, William Allen (1880–1942), U.S. college p dent, was born April 27 in B ley, Va. He was graduated from Elon college, N.C., in 1899 received his M.A. from Yale in 1904. He returned to Elon lege as professor of Latin in 1905 and was made presiden the school in 1911. He resigned 20 years later to become fessor of religious education at Vanderbilt university schoo religion, in Nashville, Tenn. He died at Black Mountain, N May 11.

Harrington, John Lyle (1868–1942), U.S. construc engineer, was born Dec. 7 Lawrence, Kan. He received his B.S. and C.E. degrees from University of Kansas, 1895, and his M.S. from McGill univer 1908. Harrington developed the vertical lift bridge and many patents on the lift and bascule spans. He designed m than 200 bridges in the United States, Canada, Russia, M churia, China, Japan and New Zealand, including spans ac the Chesapeake and Delaware canal, the Welland canal and Francisco bay.

He died in Kansas City, May 20.

Harris, Sir Arthur T. (1892–), British air officer, born April 13 in Cheltenham, I land. Educated in English public schools, he enlisted du World War I and joined the royal flying corps in 1915. commanded several squadrons on the western front and decorated with the air force cross in 1918. Made an air c modore in 1937, he was named air vice-marshal in 1939 rose to commander in chief of the R.A.F. bomber comman Feb. 1942. A firm believer in mass raids, Air Marshal H developed the "saturation" technique of mass bombing—tha concentrating clouds of bombers in a giant raid on a single with the object of completely demolishing it. He applied method with great destructive effect in the vast 1,000-plane r on Cologne and Essen and in the systematic attacks on Ger and Italian industrial centres throughout 1942. In May Sir Arthur said that if he could send 1,000 bombers over many every night, the war would be over by autumn. A afterthought, he subsequently declared: "If I can send 20 bombers over Germany in a single night, the war will end next morning."

Hart, Thomas Charles (1877–), U.S. naval off was born June 12 in David Mich. He was graduated from Annapolis in 1897, served in Spanish-American War and was a commander of submar in World War I. He was made a rear admiral in 1929 took command of the Asiatic fleet in July 1939. Adm. reached retirement age in June 1941, but was kept on because, Secretary of the Navy Knox declared, he was "a g man handling a situation in the far east that requires g skill." When the U.S.-Japanese war broke out in Dec. 1941 was compelled to take up defensive positions in Philippine wa since the Asiatic fleet was a comparatively light naval fo

On Jan. 3, 1942 Adm. Hart was made commander of A naval forces in the southwest Pacific, but was succeeded Vice-Adm. C. E. L. Helfrich of the Netherlands navy on Feb In a statement on March 11, he laid the Allied defeats in Pacific to lack of air power.

arvard University, oldest institution for higher education in the United States, completed the ixth year of its fourth century in 1942. At the end of the fiscal ear, June 30, 1941, investments exclusive of land, buildings and ontents used for educational purposes stood at $157,000,000. ifts during the year were $6,188,659 for capital account and 1,689,953 for immediate use.

Scholarships and other student aids totalled $735,444, exclusive f student loans. Student enrolment continued to fall throughout he scholastic year 1941–42 due to conscription and enlistments, ut the university's facilities were fully occupied by 3,500 army nd navy officers who were sent to 11 different service schools t Harvard for specialized training. A great deal of research nder the direction of the National Defense Research council was onducted in the laboratories. All departments of the university perated on a 12-month, 3-semester schedule which allowed the udents to receive as much training as possible before entering he armed services.

For statistics of student enrolment, faculty members, endow- ent, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.

arwood, Sir Henry Harwood (1888–) British rear-admiral. He was pecially promoted to this rank in 1939 for distinguished conduct the cruiser "Ajax" while in action against the German battle- ip "Graf Spee" off the River Plate. He entered the royal avy as a cadet at the age of 15, became lieutenant in 1908, ommander in 1921, captain in 1928. For two years from 1909 e served on the China station. Throughout World War I he as torpedo officer in various ships. He joined the staff of the oyal Naval War college in 1934 and was appointed in command the "Exeter" in 1936. In the same year, following disturbances Trinidad, the governor-general commended "this officer for his art in restoring an atmosphere of confidence and goodwill." A milar appreciation of the services rendered by the commanding ficer and men of the "Exeter" was made in 1939 by the mayor Concepción, Chile, following the earthquake there. Sir Henry as appointed a lord commissioner of the admiralty and assistant hief of naval staff in 1940, and commander-in-chief, Mediter- nean (with acting rank of admiral) in 1942.

aushofer, Karl (1869– ?), German geopolitician, was born Aug. 27 in Munich. He joined the my as a youth, later became military observer in Japan and ommanded a division on the western front during World War I. fter the war, he became professor of political geography at e University of Munich and from the classroom he first vanced a theory of geopolitics which, he asserted, would enable e reich to regain its status as a world power. He preached the octrine of the "organic state," declaring that a state is living ganism which must feed on the *lebensraum* (living space) smaller states, or else it dies.

Much of Haushofer's theories were based on the geographical oncepts originated by Sir Halford Mackinder, English geog- pher. The power of "Coastland" nations was based on naval rength, as Mackinder saw it. But he recognized the strategic osition of Germany and warned that if the reich armies could in control of the "Heartland" (which he defined as including alf of European Russia, most of Siberia and Mongolia, and estern China), they could operate from land bases and capture ritain's sea bases by overland attack.

Although Haushofer borrowed freely from Mackinder, the tter rejected German pretensions to establish geopolitics as science; he described it as a tool of nazi statecraft to grab *bensraum.*

Haushofer, however, found many willing listeners in Germany. One of his students, Rudolf Hess, introduced him to Hitler. Hitler liked these geopolitical theories, which gave a desired scientific twist to his expansionist aims.

In the early years of nazi rule, Hitler evidently agreed with Haushofer's formula for re-establishing German power: (1) get control of the "Heartland" first (by economic or military means) and (2) avoid a two-front war. In line with Haushofer's principles, Hitler "neutralized" Russia with the pact of Aug. 1939; he then proceeded to conquer most of continental Europe by June 1941, save Great Britain. But, impatient at the delay in crushing Britain, he turned on the U.S.S.R.; this action was an outright rejection of Haushofer's theories.

Soon after the war with the U.S.S.R. began, it was rumoured that Haushofer had fallen from grace and had been executed by a firing squad.

Hawaii. The territory of Hawaii consists of a group of eight larger islands and numerous islets in the Pacific ocean between latitudes 18°55′ and 22°15′ N. and between 154°50′ and 160°30′ W. longitude. Their total area is 6,438 sq.mi. The islands are of volcanic origin. From southeast to northwest, they are Hawaii, Kahoolawe, Maui, Lanai, Molokai, Oahu, Kauai, Niihau. In addition, stretching northwestward beyond Niihau over 1,100 mi. is an archipelago of rocks, reefs and shoals which includes Midway (*q.v.*) (longitude 177°22′ W.), notable as the first stop beyond Honolulu of the China clipper planes. Like-

WELDERS repairing a ship damaged in the attack on Pearl Harbor. Thousands of new workers arriving in 1942 were housed in barracks within the harbour area

wise, 960 mi. south of Honolulu and a part of the city and county of Honolulu lies Palmyra, a coral atoll consisting of 55 islets, five miles long and two and a half miles wide. The youngest island, geologically, and the largest in the group is Hawaii, with an area of 4,030 sq.mi. The capital of the territory is Honolulu, situated on the island of Oahu. It is a completely modern city with a population (1940 census figures) of 180,986. The population of Hawaii (1940 census figures) is 423,330.

The racial origin of this population, in addition to the native Hawaiians and Caucasians from the mainland, is Japanese, Chinese, Korean, Filipino, Portuguese. However, 82% of the population is native born.

History.—Ingram M. Stainback took office as governor on Aug. 24, 1942, succeeding Joseph B. Poindexter. Samuel W. King was territorial delegate in congress. Revenues for the fiscal year ending June 30, 1942, amounted to $22,065,468.54, an increase of more than $5,000,000 over the previous year. Cash on hand and in banks increased by over 25% while federal internal revenue collections increased from $13,763,998 in the fiscal year 1941 to $32,067,927 in the fiscal year 1942.

Agriculture.—Hawaii's chief crops are sugar and pineapples. Expert management, scientific methods and costly irrigation works raised the sugar production to a maximum of 1,035,548 tons in 1933 with a value of $66,482,181. Production of sugar in 1941 amounted to 947,190 tons. The pineapple industry, next in importance, produced 22,341,429 cases of canned pineapple and pineapple juice. Because of the shipping situation brought about by the war, an extensive program of production of food crops for local consumption was under way. (G. J. S.)

Hawthornden Prize: *see* LITERARY PRIZES: *Great Britain.*

Hay.

The 1942 crop of hay was the largest ever harvested in the United States, 106,328,000 tons, which was 7,000,000 tons larger than the previous record crop of 1916, and compared to 94,238,000 tons in 1941 and a ten-year (1930–39) average of 78,733,000 tons. The acreage in 1942 was 72,744,000 ac. and the yield 1.45 tons per ac. In 1941 the acreage was 71,776,000 ac., the yield, 1.31 tons. The ten-year average acreage was 67,893,000 ac.; the yield, 1.16 tons per ac. Production in 1942 consisted of 92,245,000 tons of tame hay, including alfalfa, timothy and clover, lespedeza, sweet clover, grains cut green for hay, and miscellaneous tame hay. The 1941 production of tame hay was 82,736,000 tons; the ten-year average, 69,650,000 tons. Wild hay was 13,083,000 tons in 1942 compared to 11,502,000 tons in 1941 and a ten-year average of 9,083,000 tons. This included prairie hay and marsh and salt grasses. The acreage of all tame hay in 1942 was 60,211,000 ac. and the yield 1.53 tons per ac. In 1941 it was 59,317,000 ac. with a yield of 1.39 tons; the ten-year average, 56,102,000 ac. with a yield of 1.24 tons per ac. Wild hay harvested in 1942 was from 12,533,000 ac., with a yield of 1.04 tons per ac. In 1941 it was 12,459,000 ac., with a yield of 0.92 tons; the ten-year average was 11,791,000 ac. and 0.76 tons per ac. Clover and timothy hay production in 1942 was 38,276,000 tons from 19,527,000 ac.; the yield was 1.45 tons per ac. In 1941 it was 23,470,000 tons from 19,324,000 ac. with a yield of 1.21 tons per ac.; the ten-year average, 24,587,000 tons from 22,363,000 ac. and 1.10 tons per ac. The lespedeza hay crop in 1942 was 7,330,000 tons compared to 5,537,000 tons in 1941 and a ten-year average of 1,709,000 tons. Lespedeza acreage had increased rapidly, being 6,452,000 ac. in 1942 and 5,428,000 ac. in 1941, with a ten-year average of only 1,696,000 ac. Yield was 1.14 tons per ac. in 1942. In 1941 it was 1.02 tons; the ten-year average, 0.99 tons. Sweet clover hay production in 1942 was 851,000 tons compared to 1,286,000 tons in 1941 and a ten-year average of 884,000 tons; the yiel 1.33 bu. per ac. in 1942 as against 1.32 bu. in 1941 and a te year average of 1.09 bu. The soybean hay crop was 3,945,0 tons in 1942 and 4,779,000 tons in 1941; the ten-year averag 4,098,000 tons, with a yield in 1942 of 1.36 tons compared 1.30 tons in 1941 and a ten-year average of 1.22 tons per a Cowpeas for hay equalled 1,512,000 tons with a yield of 0.83 to per ac. in 1942 and 1,618,000 tons with a yield of 0.83 in 19 and a ten-year average of 1,660,000 tons at 0.84 tons per a Peanut hay totalled 1,552,000 tons in 1942, 958,000 tons in 19 and a ten-year average of 709,000 tons; the yield 0.49 tons p ac. in 1942 and 0.53 in 1941 with a ten-year average of o. tons per ac. Grains cut green for hay produced 3,761,000 to in 1942 against 4,481,000 tons in 1941 and a ten-year avera of 4,623,000 tons.

Hayseed.—Red clover seed production in 1942 was 1,081,9 bu. compared to 1,469,300 bu. in 1941 and a ten-year average 1,056,870 bu. Alsike clover seed, 255,700 bu. in 1942 again 312,600 bu. in 1941 and a ten-year average of 314,280 b Timothy seed, 1,623,500 bu. in 1942 against 1,273,900 bu. 1941 and a ten-year average of 1,755,280 bu. Sweet clover see 724,800 bu. in 1942 against 786,700 bu. in 1941; the averag 887,170 bu. Lespedeza seed, 179,700,000 lb. in 1942 again 178,700,000 lb. in 1941; the average, 65,786,000 lb.

U.S. Hay Production (All Varieties) in Leading States, 1942, 1941 and 10-yr. Average

State	1942 tons	1941 tons	10-yr. averag tons
Wisconsin	7,639,000	7,082,000	4,906,000
Minnesota	6,922,000	6,945,000	5,116,000
Iowa	6,829,000	5,656,000	4,361,000
New York	5,975,000	4,361,000	4,877,000
California	5,107,000	4,846,000	4,445,000
Missouri	4,559,000	3,528,000	2,535,000
Nebraska	4,425,000	3,619,000	3,512,000

All other states produced less than 4,000,000 tons of h apiece in 1942. The above figures are estimates as of Dec. 1942, by the U.S. department of agriculture. (*See* also ALFAL SOYBEANS.) (S. O. R.)

Heart and Heart Diseases.

It is well to pay trib at the outset of this br review of cardiovascular knowledge in 1942 to Dr. James Herrick of Chicago, medical pioneer. Dr. Herrick compiled short history of cardiology which is of fundamental value a foundation for knowledge in this field, the only omission major importance in his book being the account of his o notable contribution.

The range of the normal heart continued to be a source much concern and renewed study as the result of the war mands for the mobilization of a large army. The moot poi concerned particularly the range of the normal pulse rate a blood pressure. The range of the rate of the normal heart in the experience of the present writer, far greater than has b ordinarily believed. Briefly, healthy athletic champions w normal hearts have had pulse rates at rest or at relative r ranging from 35 in a champion two miler to 118 in a champ Marathon runner, in the latter case just prior to the race. E treme bradycardia below a rate of 40 has been confirmed as absolutely normal finding in a number of long distance runn Four healthy athletes have been recently proved graphically have heart rates of 38, 37, 38, and 35 respectively (a Marat winner, champion miler, aviator, and champion two mile hus heart rates alone, even when extreme, are not satisfactory uides, and when recorded, within the figures given here at ast, should not be taken as a sound criterion of either cardiac r general health or efficiency.

The second problem is more difficult, namely, that of the lood pressure. After much discussion it is beginning to be the onsensus of opinion that one should follow the middle of the oad with respect to blood pressure in young men. Under extement blood pressure, especially the systolic level, may rise ormally and it is quite possible to have readings of 160 mm. g systolic on occasions in such a person. The level of the iastolic pressure is more important and it is doubtful if levels onstantly above 90 at rest should be considered normal. Among he hyperreactors will doubtless appear the hypertensives of the uture, but more study is needed to be sure of the number and ype.

Physiological heart murmurs or sounds have been occasionally cause for erroneous rejection for military service. A review f individuals rejected for such findings is likely to show some ormal hearts, and a salvage of such individuals for military or ther purposes was contemplated in 1942.

The problem of neurocirculatory asthenia (the so-called oldier's heart) again arose, especially that of the exclusion of dividuals who may be too easily crippled by this condition military service. A preliminary survey indicated that in peace me and in early training in war, before actual combat, those ho are found to have obvious neurocirculatory asthenia without asily correctible causes are those who are definitely psychoeurotic. Hence, the psychiatric part of the induction examinaon appears to be the most important source for weeding out hese individuals. Later on, under the stress of combat, the less usceptible individuals may also develop neurocirculatory ashenia but that is a real war hazard as much as that of wounds.

Hypertension still lacks specific therapy but important progress as been made with respect to one therapeutic measure which onsists of radical splanchnic resection. Smithwick developed n operation which has produced striking results not only with espect to blood pressure but to the ease of obvious strain on he heart itself.

Although this is not likely to be the final answer to the problem, or the time being it is the most hopeful aspect, at least in a cerain percentage of hypertensive individuals.

Finally, continued interest in the ever present problem of phleothrombosis, sometimes erroneously called thrombophlebitis, n the leg veins attended by the hazard of pulmonary embolism, hich may be fatal, resulted in the more widespread recognition f both of these conditions (leg vein thrombosis and pulmonary mbolism) leading sometimes to the institution of lifesaving measures, in particular, ligation of the leg veins.

White, "Cardiac Problems in Wartime," *nnals of Internal Medicine* (in press). (P. D. W.)

Helium. Since helium is the most important factor in aviation with craft lighter than air, it was natural that little nformation was given out with respect to production in the United States, especially since this country had the only commerial deposits of this gas in the world. The output of the recovery lant working on the natural gas from the Cliffside (Texas) gas eld was reported at 9,451,000 cu.ft. during the fiscal year ending une 30, 1940, and enlargements were under way to increase this o 12,500,000 cu.ft. in the 1941 fiscal year. After that date, other extensions were made at Cliffside, and five other plants were being built. (G. A. Ro.)

Henderson, Leon (1895–), U.S. economist, was born in Millville, N.J. on May 26. In 1917 he entered the U.S. army as a private, attaining the rank of captain of ordnance by 1919. In 1920 Henderson returned to Swarthmore college, where he received his B.A. degree. During the early New Deal era, he served as consulting economist to the Work Projects administration.

On April 11, 1941 the Office of Price Administration and Civilian Supply (later renamed the Office of Price Administration, *q.v.*) was created by President Roosevelt to check the rise in prices caused by the defense program, and Henderson was placed at the head as price administrator. In July 1941 Henderson, who had been a Securities and Exchange commissioner since 1939, resigned this post to devote himself to his new task. On Dec. 26, 1941, after the U.S. entered World War II, he strictly rationed motor-car tires and on Jan. 2, 1942, he announced that all motor-car production for civilian use would be halted "for the duration."

Henderson predicted that his efforts to impose necessary rations on Americans to further the war effort would make him the most unpopular man in the United States. His prophecy approached fulfilment as the year progressed, and Henderson tendered his resignation as OPA administrator Dec. 17, 1942. He had resigned as chief of the WPB Office of Civilian Supply a week earlier.

Henderson, Sir Nevile Meyrick (1882–1942), British statesman, was born June 10. A graduate of Eton, he entered the diplomatic service as third secretary at St. Petersburg in 1905. He also served in Tokyo and Rome and in 1916 was sent to Paris as first secretary; he was counsellor in Constantinople, 1921, and acting high commissioner there, 1922–24. He was minister to Cairo, 1924, held the same post in Paris, 1928–29, was envoy to Belgrade, 1929–35 and ambassador to Argentina and minister to Paraguay, 1935–37. Sir Nevile was Britain's last ambassador to Berlin, 1937–39, before the outbreak of World War II. Henderson staunchly defended Chamberlain's appeasement policy and in the final weeks before the outbreak of war, shuttled between England and Germany with the hope of averting hostilities. He returned to England, wrote *Failure of a Mission* (1940), an apologia of his ambassadorship to Berlin. He became group commander, with rank of colonel, in the home guard, 1941. Sir Nevile died in London, Dec. 29.

Hertz, Alfred (1872–1942), U.S. conductor, was born July 15 in Frankfort-on-Main, Germany, and studied music at the Raff conservatory there. He conducted orchestras at the age of 19 and had directed at various theatres in Germany until 1902. At that time, he was called to New York city by Maurice Grau to conduct at the Metropolitan Opera house and there gave the first American performance of Wagner's *Parsifal* in 1903. In 1915, he resigned to take up a post as conductor of the San Francisco Symphony orchestra. Dr. Hertz introduced and conducted the summer symphony concerts at the Hollywood bowl in Los Angeles. He retired from the San Francisco orchestra in 1930 and from 1932 to 1939 directed a radio symphony program. He died in San Francisco, April 17.

Hertzog, James Barry Munnik (1866–1942), South African politician, was born of Dutch stock in Wellington, Cape Colony, on April 3. Gen.

Hertzog, who was prime minister of the Union of South Africa, 1924–39, strongly opposed the Union's declaration of war against Germany in World War II and resigned as premier in Sept. 1939. Hertzog, sympathetic toward axis aims, resigned from the United Nationalist party in 1940 and shortly afterwards from parliament. At an Afrikander party convention in Oct. 1941, he urged South Africans to adopt a National-Socialist (nazi) form of government. He died in Pretoria, Nov. 21. (See *Encyclopædia Britannica.*)

Hewitt, Henry Kent (1887–), U.S. naval officer, was born Feb. 11 in Hackensack, N.J. A graduate of the U.S. Naval academy, 1906, he was commissioned an ensign in 1908. He won the Naval Cross for distinguished service in World War I, and later served as commander of a destroyer division. He was inspector of ordnance in charge of the naval ammunition depot at Puget sound and commanded the cruiser "Indianapolis," on board which President Roosevelt sailed for South America in 1936. He was promoted to rear admiral in Dec. 1940. Adm. Hewitt was named to command the U.S. naval units in the huge Allied fleet that protected the U.S. landings in North Africa Nov. 8, 1942. Two days after the initial landings in Algeria, Adm. Hewitt's warships and dive-bombers engaged in an all-out assault against Casablanca, battering the French fleet which offered stiff resistance. After a brief but sharp naval engagement, his fleet moved toward shore and protected, with a heavy barrage, the advancing tank forces that penetrated the Moroccan city, which surrendered Nov. 11, 1942.

Heydrich, Reinhard (1904–1942), German gestapo official, was born March 7 in Halle, Prussian Saxony. At the age of 14 he joined a Free Corps band, where he became schooled in street-fighting, terrorism and looting. In 1922, he joined the navy, rising to the rank of first lieutenant, but resigned in 1931 to devote his time to nazi party affairs. Soon after Hitler became chancellor, Heydrich was appointed chief of the political department of the Munich police force, with control over the notorious Dachau concentration camp. In 1934, he was appointed gestapo chief for Berlin and was later made deputy chief of the gestapo under Heinrich Himmler. Ruthless in dealing with "enemies of the state," Heydrich was singled out in Sept. 1941 to supersede Baron Constantin von Neurath as Reichsprotector for Bohemia and Moravia. He ordered the execution of 300 Czechs within five weeks of his arrival in Prague. He was then dispatched to Norway, the Netherlands and occupied France to suppress mounting sabotage and terrorism, and his visits resulted in more mass executions. He was so hated and feared by anti-nazi elements throughout Europe that he was called "the Hangman." On May 27, Czech patriots bombed and shot him while he was riding in his car on the Prague-Berlin highway. He died June 4 in a Prague hospital. Gestapo officials exacted vengeance for his death by executing hundreds of Czechs and wiping out the entire village of Lidice, whose townsfolk were accused of harbouring Heydrich's assassins.

Hill, (Red) William (1886–1942), Canadian daredevil swimmer and self-styled "master hero" of Niagara, was born October 22 at Niagara Falls, Ont. He made three trips through the Niagara Falls rapids, the first in 1910, when he shot the rapids in a barrel reaching the Lewiston, N.Y., shore in safety. He was credited with 28 rescues from the dangerous Niagara rapids, many at the risk of his own life. He died of a heart attack at Niagara Falls, Ont., May 14.

Hillhouse, Percy Archibald (1869–1942), British na architect, was born Ma 4 at Derby. After studying at Glasgow university, he becam draughtsman for a shipbuilding and engineering firm. Later, was invited to become professor of naval architecture at the I perial university in Tokyo, 1898–1902. Ships of his design w used in the Russian-Japanese war. Upon his return home, he a naval architect and held the chair of naval architecture Glasgow university from 1921 until his death. He was the aut of several monographs on ship designing and also *Ship Stabi and Trim.* Prof. Hillhouse died in Glasgow, Sept. 28.

Himmler, Heinrich (1900–), head of the Gern police and founder of the *Schutzsta* was born Nov. 7 at Munich. At the University of Munich, specialized in agriculture. In later life he became a member the Academy of German Law. From an insignificant beginn he rose steadily to power in the Hitler political revolution. though a participant in the abortive Munich beer hall putsch 1923, he escaped imprisonment with Hitler. In 1927 he beca deputy leader of the German S.S. (Black Shirts), expanded offset the power of the Brown Shirt troops, and was made lea in 1929. The fuehrer never had a more loyal or ruthless devo Himmler served as reich director of propaganda from 1926 1930, became a member of the reichstag and the Prussian s council in 1933, commander of the united German police fo in 1936 and deputy head of the reich administration in 19 During 1942 he was sent by Hitler to various occupied count to quell anti-nazi resistance, working closely with his pupil lieutenant, Reinhard Heydrich (*q.v.*) in carrying out a prog of wholesale executions among subjugated peoples. After H drich's assassination, Himmler eulogized his friend at the fun in Berlin on June 8, declaring it to be the "sacred obligation the nazis to avenge his death." (C. A. Sr.

Hispanic America: *see* Argentina; Bolivia; Brazil; B ish Guiana; British Honduras; Chile; Colombia; Co Rica; Ecuador; French Colonial Empire; Guatemala; H duras; Nicaragua; Panama; Paraguay; Peru; Salvador, Surinam; Uruguay; Venezuela.

Hispanic America and World War II. World Wa (*q.v.*) con ued to affect activities of the Hispanic American states du 1942, but in general the pattern of affairs did not differ gre from that established during the preceding year. The first portant political event was the meeting of the ministers of eign affairs of the American republics at Rio de Janeiro, Jan. 28. This was the third of such meetings (others were at Pana 1939, and Havana, 1940) and was designed to further plan hemisphere defense both in military and in economic fields. the work of the Rio conference the main contest developed a proposal to have all American states which had not yet don sever diplomatic, commercial and financial relations with the powers. The delegations of Argentina and Chile were oppose the move, not because their sympathies were particularly axis, but rather in line with a historic reluctance to follow lead of the United States, coupled with a feeling that the m was neither necessary nor prudent on their part. This oppos was stubborn enough to prevent the adoption of a clear-cut lution on the subject, and throughout the rest of the year two republics maintained this neutral status, even though American states were allowed non-belligerent privileges in

SION OF JAN. 23, 1942, at the Rio de Janeiro conference. At this meet- all the American republics pledged adherence to a resolution which recom- ded severing diplomatic relations with the axis nations

ritory.

While the Rio conference failed in complete attainment of its jor political objective, many steps were taken which furthered ordinated hemisphere defense activities. Among the more sig- cant was the establishment of a uniform plan for control of ncial and commercial activities of the axis in the hemisphere, the custodianship and possibly operation or sale of alien my property, for the co-ordination of intelligence services, for anization of military and political defense, and finally for "eco- nic mobilization" to the end that all resources of the New orld would be fully utilized. It was also agreed by the confer- e that any American state, or even one not American if its orts served to defend the hemisphere, would not be treated as elligerent in other American republics.

Various committees were created by the Rio conference. The er-American Defense board began continuous sessions in Wash- ton on March 30, charged with the co-ordination of military l naval policy, the handling of war supplies, control of com- nications, protection of American shipping and similar duties. April 15, a 7-man Emergency Advisory Committee for Politi- Defense met in Montevideo to plan prevention of axis propa- da and sabotage, and a board representing police and judicial cials concerned in the same effort held sessions in Buenos es May 28–June 9. The complex task of control of alien enemy perty, funds and commercial activities was entrusted to the er-American Financial and Economic Advisory committee, one the leading bodies which had been functioning since the Panama ference; it now took over general supervision of the entire nomic program, aided by national committees of the same type in each republic. This body also arranged uniform controls over the export and import of United States currency, of which $1,000,000,000 or more in axis hands could be sent to the Americas for subversive action.

In accordance with regular schedule, many other inter-American bodies met during the year. In one, the conference on American agriculture held in Mexico City July 6–16, a protest was made against efforts under way in the United States to lessen the use of coffee and sugar. The pact made at Havana in 1940, dealing with the administration of European-owned territory in the Americas when necessary, was made effective on Jan. 8, 1942, by signature of Honduras, the 14th state to sign; by June all but four nations had ratified. The first "Pan American Conference of Free Italians" met Aug. 14 at Montevideo in an attempt to parallel Free French organization.

Two more Hispanic American nations, Mexico and Brazil, joined during 1942 the ranks of the American states at war with axis powers. In both cases submarine sinkings precipitated action. Mexico voted for war on June 1, and Brazil entered the conflict Aug. 22. Because of the size and geographic position of these states, their action was particularly gratifying to the United States. Co-operation between the United States and Mexico had been marked, and one possibly dangerous issue had been removed on April 17 by the acceptance of an oil claims award; Mexico agreed to pay $23,995,991 in compensation for expropriated property. At the same time the United States announced that $40,000,000 had been allotted to stabilize the Mexican peso, and that the Export-Import bank had advanced a $30,000,000 credit for highway construction and industrial development in Mexico. Brazil, even before entering the war, had taken steps against axis dangers.

With the exception of Argentina and Chile, the remainder of the American republics co-operated with the United States in hemisphere defense with greater or less efficiency. Axis nationals were put under restrictions varying from simple registration to arrest, internment, and even deportation. Some states, such as Mexico and Colombia, prohibited their presence in strategic coastal zones, and in Cuba one spy was executed. In the belligerent states, axis property was taken over, and vessels, coffee plantations, and even funds were put to use by the governments concerned. There was extensive limitation of the activity of axis organizations throughout Hispanic America (the most active groups had already been discontinued in 1941). In Colombia German schools were closed. Control of radio and other means of communication was general, and in some cases, as in Cuba, censorship of mail and news was set up. Axis propaganda was thus reduced in effectiveness, although the short wave radio still remained, and Argentina and Chile could serve as dissemination centres. The Spanish diplomatic service, which usually took over axis affairs where relations were severed, and the Spanish military intelligence (SIM), were charged with activity in support of the fascist program. For this reason Cuba sharply curtailed the privileges of the Spanish embassy, and prohibited Spanish ships from entry into its ports. Cuba also, with Haiti, broke off relations with Vichy France in November. As opposed to the suspicion attached to Spain, Soviet Russia gained in favour in some states and was accorded recognition by Cuba, Costa Rica and Uruguay.

The official settlement of the Peru-Ecuador boundary controversy in the early months of 1942 lessened danger to inter-American accord, and in the summer Venezuela and Colombia ended a similar, although less serious dispute. A Colombian president visited Venezuela for the first time since the days of Bolívar, and with most of the administrations in Hispanic America friendly to that in Washington, several chief executives, among them Batista of Cuba, Prado of Peru, and president-elect López of Colombia made trips to the United States during the year. A projected trip by Pres. Ríos of Chile was postponed after a speech made by Under-Secretary Sumner Welles (Oct. 8) in which Chile and Argentina were characterized as spy centres.

Practically every Hispanic American nation increased the strength of its military establishment, and some—Nicaragua, Cuba, Colombia and Uruguay among them—inaugurated military service on a compulsory basis. In some cases United States military missions aided in the training program. United States troops were reported as building a base in Ecuador in March, and were in the Dutch islands of Aruba and Curaçao by Feb. in co-operation with a Venezuelan consultative mission. United States air forces also used fields in Cuba, Guatemala and Panama, but insofar as information was available, the North American personnel at other than United States bases was very limited in number.

In the economic field the program of stabilization of Hispanic American trade and finances was reasonably successful during 1942. The shift in trade toward United States markets was more apparent than ever. While exact figures were not published in 1942, at the end of March it was reported that there was a 46% increase in the net trade balance in favour of Hispanic America ($124,094,000 in 1942 as compared with $85,285,000 for an equivalent period in 1941); by July this credit balance had grown to $166,000,000. The character of export trade had changed greatly, with strategic materials in great demand and such products as bananas less important. The priority problem affected import trade; in the first half of the year, orders for Hispanic America were given top rating, but in Sept. the WPB announced that the urgent military program would take preference. Trade was also handicapped by a shipping shortage, particularly acute during the spring and summer. A lack of tankers affected indus
and transportation dependent on fuel oils. Highway and railr
construction helped in moving goods in Mexico and northern C
tral America, and Pan American Airways reported that the nu
ber of its flights had been tremendously increased, but air
land services could not compensate for more than a part of
cargo space. The resultant decline in the available amount of c
sumer goods, plus increased purchasing power, brought about
ing living costs—in some cases greater than in the United Sta
In the Caribbean zone in particular it was necessary to establ
rationing and price ceilings. An increase in inter-Hispanic Am
ican trade was reported; Argentina and Chile agreed to excha
quantities of goods, and Colombia took the entire cotton surp
of Haiti. Argentina likewise negotiated a barter agreement w
Spain in the early months of the year, exchanging meat and a
cultural products worth 150,000,000 pesos for Spanish manuf
tures. It was estimated that Hispanic American exports to Can
were heavy.

Vigorous attempts were made during the year to increase p
duction of strategic materials. The rubber-planting program
Haiti, Brazil and Costa Rica was pushed, and airports were c
structed in Colombia to aid in gathering wild rubber. The Uni
States agreed to purchase the entire output of Peru and Ecuac
and a Brazil-United States health program was organized to sp
rubber gathering in the Amazon region. In Cuba a $20,000,
nickel development was announced in the summer, and it
reported that Peru and Brazil might be able to supply minim
needs for rotenone.

The economy of Hispanic America was largely upheld dur
1942 by loans made by the United States. No exact figures
the year were available, but by the end of May, Export-Imp
bank credits allotted to Hispanic America amounted to $6
961,616, of which $149,504,000 had been actually used. Spec
commitments had been made to all countries by that date exc
Guatemala. At least $13,000,000 had been expended in addit
on defense projects in the area. (*See* also PAN AMERICAN UNI
WORLD WAR II and articles on individual countries.)

Hitler, Adolf (1889–), German statesman, was born
Braunau on the Inn, Austria, April 20.
his career prior to 1942 see his biography and the art
"Germany" in *Encyclopædia Britannica.*

Four days after the Japanese attack on Pearl Harbor Dec
1941, Hitler declared war against the United States. On Jan.
1942, Hitler admitted the failure of his Russian drives,
promised a new offensive to crush the Russians. On April
the reichstag unanimously passed a new law enabling him
remove from office or positions any person (or general)
dared disagree with him. His long-heralded offensive, startec
June 1942, penetrated deep into the Caucasus, but was stop
short at Stalingrad. On Sept. 30, 1942, Hitler spoke of Staling
as a city "which we shall take, you may depend on it."
Stalingrad stood like a rock; the Russians not only made
their city a second Verdun, but were able to take the offen
during Nov. 1942. Again his failure to realize a "comple
victory in Russia led him to overhaul his high command.
made Gen. Kurt Zeitzler chief of the general staff, but contin
to hold the post of commander-in-chief himself. After
U.S. landings in North Africa, he ordered his troops to occ
all France on Nov. 11, 1942. A day later, he said his ar
would avenge the American landings in Africa in "due tin

e tried to seize the French fleet at Toulon on Nov. 27, but rench sailors moved quickly and scuttled the majority of eir ships. As the year 1942 ended, Hitler's armies were in treat in Africa and Russia; Allied bombings of German cities ere intensified, and Italian morale was seriously weakening. gainst this gloomy backdrop the German fuehrer, who was nfident of a short war when he set out to conquer Europe, ld his people on Dec. 31, 1942,: "Winter may be difficult. Its ows, however, cannot hit us harder than last year." (*See* also ERMANY; WORLD WAR II.)

obby, Oveta Culp

(1905–), U.S. director of the Women's Auxiliary Army Corps VAAC) (*q.v.*), was born Jan. 19 in Killeen, Tex. A graduate the University of Texas Law school, she was successively a ember of the Texas legislature, assistant city attorney of ouston and a bank director. She also helped codify Texas nking laws and was the author of a text on parliamentary w. In 1931, she married William Pettus Hobby, former gover- r of Texas, and took an active interest in his newspaper, the *ouston Post,* becoming executive vice president. In 1941, Mrs. obby was called to Washington on a dollar-a-year job as chief the women's interests section of the war department's public lations bureau. At the behest of General Marshall, she drafted ans for a women's army and on May 16, 1942, she was sworn as director of the first force of this kind in United States story, with a rank equivalent to that of a major. The WAAC, heduled to have 12,500 women in uniform after the first year, as subsequently authorized to expand to 150,000. In late Oct. 42, Mrs. Hobby went to England to inspect the Women's uxiliary Territorial Service, Britain's equivalent to the WAAC.

ETA CULP HOBBY, director of the Women's Army Auxiliary corps, and Col. nald C. Faith, commandant, inspecting the WAAC's barracks at Fort Des ines, Ia., on the opening day, July 19, 1942

ogs.

The largest pig crop on record, 105,500,000 head, was produced in the United States in 1942. This number was out one-third larger than the ten-year average prior to 1934 in hich period, before the losses from droughts in the middle '30s, pig production was at its previous highest level. The 1942 spring crop of pigs was 62,000,000 head, an increase of 25% over the spring crop of 1941. Final figures were not available for the fall pig crop of 1942, but in Dec. 1942 it was estimated by the department of agriculture as 43,500,000 head, an increase of 22% over the spring crop of 1941. For 1943, to meet military, lend-lease and home-consumption needs, the government asked a pig crop of 121,000,000 head. The agricultural department also asked that the weight of hogs be increased by 10 lb. before marketing. The government, to encourage swine production, promised to support hog prices through Sept. 1944 at a minimum level of $13.25 per cwt., average Chicago basis, for good and choice grade butcher stock of 240 to 270 lb.

It was estimated that the slaughter for the packing year beginning Oct. 1, 1942, and ending Sept. 30, 1943, would be 94,000,000 to 95,000,000 head. For the packing year ending Sept. 30, 1942, slaughter was 52,400,000 head. Prices for hogs in 1942 also reached a 22-year peak; and for the week ending Oct. 21, 1942, in Chicago averaged $15.45 per cwt. This was about $4 over the same period in 1941. In 1941–42 the hog-corn price ratio was particularly favourable for swine production, especially in view of the record corn crop of 1942. There was a steady increase in hog numbers. In its annual report issued Feb. 18, 1942, the department of agriculture estimated the number of hogs on farms as 60,526,000 head compared with 54,256,000 in 1941 and a ten-year (1931–40) average of 51,566,000 head. With the large increase in the pig crop of 1942 and the expected still larger increase in 1943, questions were raised as to the capacity of packing plants to handle such volume of production. It was said that if shipments maintained an even flow, packing capacity would be sufficient to handle it. But to take care of peaks, the department of agriculture was planning a system under which farmers might ship hogs only by permit. Shippers would apply to a shipping board three days before contemplated shipments to obtain a permit. Shipping boards would be composed of representatives of the government, the packers and the livestock exchanges.

Hogs contributed in a novel way to the sale of about $50,000 in war bonds in 1942 at a Victory hog sale in Rushville, Ind., where farmers accepted payment for 600 hogs in war bonds and the governor of the state spoke at the ceremony. (*See* also MEAT.)

Hollins, Alfred

(1865–1942), blind British composer and organist, was born Sept. 11 in Hull, England. He studied piano and organ at the Wilberforce institute, York, the Royal Normal College for the Blind, London, and as a pupil of Hans von Bülow. At 13 years of age, he made his first public appearance as a solo pianist at the Crystal palace, London, and some years later made a tour of the United States with a quartet of blind players. On later visits to the U.S., he appeared with the New York Philharmonic and the Boston Symphony orchestras. He composed religious as well as concert organ music, piano solos and songs, and was the author of *A Blind Musician Looks Back* (1936). He was organist at St. George's West Church, Edinburgh. Hollins died in Edinburgh, May 17.

Holmes, Phillips

(1909–1942), U.S. actor, was born July 22 in Grand Rapids, Mich. He was a student at Trinity college, Cambridge university, England; at Grenoble university, France, and at Princeton. He appeared in his first motion picture in 1928. After playing with his father, Taylor Holmes, in *The Great Necker* in New York, he starred in many U.S. motion pictures in the 1920s and 1930s and later principally in foreign movies. His chief roles were in *An American Tragedy* and *The Devil's Holiday*. Holmes enlisted in the Royal Canadian Air Force in Dec. 1941 and won promotion to the rank of leading aircraftsman. He was killed in a collision of two planes, near Armstrong, Ont., August 12.

Homma, Masaharu (1888?– ?), Japanese army officer, was an observer with the British forces in France during World War I. He served as resident officer in India, 1925, as military attaché in London, 1930, and was decorated with the Military cross of the British empire. In 1939, he commanded Japanese forces at Tientsin, China, when the Japanese army blockaded the foreign concessions there. He was next sent to Formosa to command the 14th army, which was preparing for a Philippine invasion. Homma was made commander in chief of the Japanese expedition to the Philippines in the winter of 1941–42, but despite his numerical strength and armed superiority, the general failed to defeat the American-Filipino forces. He was reported to have committed hara-kiri in February in a Manila hotel suite occupied by General MacArthur prior to the evacuation of the capital, because he had "lost face," but later indications were that he was still alive.

Honduras. The third largest Central American republic. Area, 46,250 sq.mi.; pop. 1,040,000, largely rural. Capital, Tegucigalpa (35,000); other cities: San Pedro Sula (17,500), La Ceiba (13,800), Choluteca (13,600). Religion: Roman Catholic; language: Spanish. President in 1942: General Dr. Tiburcio Carías Andino.

History.—Honduras actively co-operated in hemisphere defense in 1942, in line with its policy adopted the previous year. Age limits were widened to increase army strength, war materials were purchased and the defense budget increased. The president was authorized to borrow up to $15,000,000 for defense and civil emergency needs, and a national bank was established to facilitate financial operations. Axis-owned property was taken over, and control over the movement of United States currency was established.

The Honduran economy was hit hard by the drop in banana exportation. A policy of price control and conservation was set in operation, although as late as Oct. 1942 price fixing reportedly was not too effective. In order to alleviate the unemployment situation in the banana region, construction work employing 1,000 men was started on a portion of the road from Tegucigalpa to the Pacific.

Education.—Elementary schools in Honduras in 1942 numbered possibly 1,000, with an estimated enrolment of 35,000; institutions of higher learning had an enrolment of approximately 3,000. The 1942–43 budget allotted 918,000 lempiras to education.

Defense.—The Honduran army (1,500 regulars, 15,250 national guard) was strengthened to meet war needs. Age limits for active service were widened to 18–32 yrs.; reserve service: 32–45 yrs. The defense budget (1942–43) was 2,416,000 lempiras (later increased).

Finance.—The monetary unit is the lempira, equal to 49 cents U.S. in 1942. The budget for 1942–43 was balanced at 12,222,000 lempiras.

Trade.—Late trade statistics were not available in 1942. Trade with the U.S. for the first half of 1941 listed imports as $3,6
000, exports as $4,032,000. Total trade for the fiscal year 19
41 was $19,952,326 (imports: $10,085,170; exports: $9,867,1
Bananas (65%) were the most important item of export; preci
metals (25%) second.

Communication.—External communication is by steams
and Pan American Airways; the latter reported increased se
ices while the former was curtailed during 1942. There were
mi. of railroad; 500 mi. of highway in 1942.

Hongkong. A British crown colony, occupied by the Ja
nese in 1941, Hongkong is an island off
southeastern coast of China, opposite Kwangtung province
the mouth of the Canton river. The area of the island is a l
over 32 sq.mi.; the crown colony also includes the New Te
tory, on the mainland, with an area of 356 sq.mi. Kowl
immediately opposite Hongkong Island and connected with
by a ferry, is the largest town in the New Territory.
estimated population of the crown colony in the middle of
was 1,047,768, of whom 24,125 were non-Chinese, mostly Brit
These figures did not include the personnel of the armed fo
stationed at Hongkong or the approximately 750,000 Chin
refugees. The governor of Hongkong at the time of the Japan
attack in Dec. 1941 was Sir Mark Young, who became a p
oner of war.

Hongkong was one of the first strongholds of western powe
the orient to fall before the Japanese onslaught. Operat
against the colony began Dec. 8, 1941, and the surrender t
place on Dec. 25. The Hongkong garrison had been rece
reinforced by a Canadian detachment of some 2,000 soldi
but the Canadians arrived without much of their mechan
equipment, and the entire number of troops at the disp
of the British command was insufficient to guard effectively
parts of the island or to counteract the Japanese tactics
infiltration and sniping. Japanese superiority in the air
overwhelming, and the destruction of reservoirs and other sou
of water supply hastened the fall of the city. There was l
news of Hongkong under Japanese occupation in 1942; it
occasionally bombed by U.S. air forces in China.

Education.—Hongkong in 1940 had 1,273 schools of
types, with 116,280 pupils. There was a university with
students. Expenditure on education was 2,807,269 Hongk
dollars.

Finance and Trade.—The revenue of the colony in
was 41,478,052 dollars (Hongkong), expenditure was 37,949
dollars. (The Hongkong dollar before the fall of the colony
equivalent to about 25 U.S. cents.) For the 15 months f
Jan. 1, 1940, until March 31, 1941, revenue was 70,175
dollars, expenditure 64,787,557 dollars. The public debt
27,268,000 dollars. In 1940, 28,943 vessels of 21,908,350
entered and cleared from Hongkong. Hongkong's imports f
the British empire, excluding Great Britain, in 1940
£4,786,013, exports were £7,503,908. Imports from foreign c
tries were £38,903,596, exports £28,535,291. Imports from
United Kingdom in 1938 were £3,937,515, exports £982,339.
(W. H. Ch

Hopkins, Harry L. (1890–), U.S. politician, was
Aug. 17 in Sioux City, Ia. After gra
ating from Grinnell college in 1912, he went to New York cit

gage in social service work. He later became a fast friend of ranklin Delano Roosevelt, then governor of New York, who in 33 appointed him federal administrator of emergency relief. rom 1935 to 1938 he was administrator of the Works Progress lministration. In the latter position, he expended billions to ovide work relief instead of monetary relief for unemployed illions. Hopkins was appointed secretary of commerce, 1938, ıt resigned in Aug. 1940 because of ill health. In Jan. 1941, was sent to London as President Roosevelt's personal emissary study the war situation at first-hand. On March 27, 1941, the esident named him lend-lease co-ordinator. Enjoying a unique osition as one of the president's most trusted friends and lvisers, Hopkins flew to London on a second mission in July 41, thence going to Moscow to confer with Soviet Premier sef Stalin. The next month he retired as lend-lease administra- r and was succeeded by Edward R. Stettinius, Jr. On April 8, 42, he went to London with Gen. Marshall, U.S. army chief staff, to confer with British officials on United Nations war oblems.

ops. The commercial crop of hops in the United States is grown in three states, Washington, Oregon and Cali- rnia. Production in 1942 was only 34,896,000 lb. from 34,700 ., which was but 100 ac. less than the 34,800 ac. harvested 1941, when the crop was 40,380,000 lb. Unfavourable condi- ons which caused reductions in the 1942 crop included extremely t weather in Washington in August, mildew infestation in egon and heavy "dry-away" in California. The "dry-away" ıs also more severe than usual in Washington and Oregon. ıe ten-year (1930–39) average crop of hops was 34,655,000 lb. om an average acreage of 29,720 ac. The 1942 yield was 551 lb. per ac. in Washington, 1,280 lb. in California and 680 . in Oregon; the 1941 yield, 1,850 lb. per ac. in Washington, 350 lb. in California and 840 lb. in Oregon; the ten-year erage yield, 1,771 lb. per ac. in Washington, 1,505 in Cali- rnia and 935 lb. in Oregon. These estimates are as of Dec. 1, 42, by the U.S. department of agriculture.

U.S. Production of Hops by States, 1942, 1941 and 10-yr. Average

State	1942 lb.	1941 lb.	10-yr. average lb.
regon	13,124,000	16,800,000	18,188,000
Vashington	11,788,000	13,320,000	7,767,000
alifornia	9,984,000	10,260,000	8,701,000

ormones: *see* CANCER; ENDOCRINOLOGY.

ornblow, Arthur (1865–1942), U.S. editor and writer, was born in Manchester, England. He udied literature and painting in Paris and worked there as a rrespondent for English and U.S. newspapers. In 1889, he went the United States and worked on several newspapers, but his incipal interest was the theatre. He was editor of the *Theatre agazine,* 1901–26, and wrote the *History of the Theatre in merica* in 1919. Hornblow translated many works by Marcel révost and Gabriele d'Annunzio and also put many plays into ovel form, including *The Lion and the Mouse* (1906), a Broad- ay success. He died in Asbury Park, N.J., May 6.

orse Racing. At the close of 1942 a total of $18,131,118 had been distributed to winners at recog- zed meetings in the U.S., the record having been $17,987,- 5, in 1941. New York, the leading racing state, disbursed ,541,485, a gain of $342,931 over 1941. Illinois, next in rank, sbursed $2,487,150, a gain of $482,830 over 1941. The only area in which there was a notable decrease was California, hitherto one of the leaders, which in 1941 had stood second with a disbursement of $3,156,549. All racing in California was discontinued by governmental fiat at the outset of war and the chief racing plant, Santa Anita park, near Los Angeles, was converted into a concentration camp for interned Japanese. Not until late in the fall was a modest resumption permitted.

The nation-wide attendance was astonishing considering the transportation difficulties that prevailed. Precise figures were unavailable, but the total for the year must have equalled, if it did not exceed, that of 1941. The vast increase in the amount of money in circulation, due to the war effort, was reflected in the volume of betting, which rose to unprecedented heights. "Million dollar days" were frequent. In New York alone the taxation revenue from this feature exceeded $10,000,000. A feature of the year was the raising of over $3,000,000 by voluntary contribution of the racing associations to the nation's war effort.

Whirlaway, four-year-old chestnut colt bred and owned by Warren Wright, Calumet Farm, Lexington, Ky., was again adjudged the "horse of the year." His earnings were $211,250, and he won 12 of 22 races. This brought his total winnings up to $560,911 and made him the leading money-winning horse of the world and the first to cross the $500,000 line, the previous record having been $437,730 by Seabiscuit. He was not, however, the leading winner of the year. That honour went to the three-year-old chestnut colt Shut Out, bred in Kentucky and owned by Mrs. Payne Whitney, of New York. His winnings were $238,972. Also excelling Whirlaway's record was that of the three-year-old colt Alsab, owned by Mrs. Albert Sabath, of Chicago, with a credit of $234,565. Shut Out won both of the richest races run during the season, the Classic, at Arlington Park, Chicago, worth $69,700, and the Kentucky Derby, at Louisville, worth $64,225. His earnings, together with those of the other starters by his sire, Equipoise, gave that stallion the championship of the year with a total of $437,041; which was the largest sum ever won by the get of any stallion in a single year in America or any other country. The leading two-year-old was Occupation, brown colt bred and owned by John Marsch, of Chicago (winning $192,355); but the bay colt Count Fleet, bred in Kentucky and owned by Mrs. John Hertz, of New York, was awarded the title of champion of that age. His feat of running a mile in 1:34 4-5, the fastest of the year by a horse of any age, and defeat of Occupation in their last meeting, earned him the honour.

The leading money-winning stable of 1942 was the Greentree stable of Mrs. Payne Whitney, for whom 36 different horses won 53 races and $414,432. This, however, fell short of the $475,091 won by the Calumet Farm stable in 1941. Mrs. Whitney's horses were trained and managed by John M. Gaver.

The principal American time record lowered during the year was that for a mile and a half, which was reduced from 2:28 2-5 to 2:27 3-5 by Bolingbroke, also a son of Equipoise. The three-year-old bay filly Vagrancy, bred in Kentucky and owned by William Woodward, of New York, was supreme among the mares of the year. She won 11 races and $84,380.

The leading jockey of the season was Johnny Adams, who rode 245 winners. He also led in 1937 when he rode 260 winners. While J. M. Gaver led the money-winning trainers with $406,547, the leading race-winning trainer was Hirsch Jacobs, with 133, this being the ninth time he had earned that title in 10 years.

Harness Turf.—War conditions affected the harness turf much more seriously than the running side. Many of the great state fair plants were taken over by the government for use in the war effort. This led to the cancellation of some of the most

"ROOKIE HORSES" of the U.S. army learning to jump hurdles in 1942 at Front Royal, Va. The newly-purchased horses are branded, inoculated, and quarantined for 21 days, after which they are given 80-120 days of training for military service

important Grand Circuit and other meetings. The principal event of the season was the Hambletonian stake, for three-year-olds, trotted at Goshen, N.Y., and worth $38,954.38. It was won by the bay colt The Ambassador, owned by W. H. Strang, of Brooklyn, N.Y., and trained and driven by Ben White.

(J. L. He.)

Great Britain.—King George won four of the five substitute classic races during the 1942 flat-racing season with his filly, Sun Chariot, and his colt, Big Game, leased from the National Stud. Sun Chariot, by Hyperion out of Clarence, was without doubt the best three-year-old in training, and the champion jockey, Gordon Richards, rode her to victory in the One Thousand Guineas, the Oaks and the St. Leger. Big Game, by Bahram out of Myrobella, was successful in the Two Thousand Guineas and was expected to win the Derby. His breeding on the dam's side, however, suggested that he would not be capable of staying a mile and a half. Such proved to be the case, and Big Game failed to reach a place in the Derby behind Watling Street, by Fairway out of Ranai, who gained a narrow victory for Lord Derby at the expense of Lord Rosebery's Hyperides.

Big Game and Sun Chariot were trained by F. Darling at Beckhampton, and were both retired to the stud at the end of the season. Mr. Darling also turned out Owen Tudor, winner of the previous year's substitute Derby, to win the race for the Gold Cup.

The King ended the season at the head of the winning owners' list, Mr. Darling and Gordon Richards led the winning trainers' and jockeys' lists respectively, and the stock of Hyperion, winner of the Derby and St. Leger in 1933, won most stake money.

Transport difficulties and other restrictions were responsible for a big reduction in the number of horses in training. Horses over the age of four years were not permitted to compete in handicap events after June 1, but this restriction was modified in the plans proposed for the 1943 flat-racing season, when racing was again to be conducted on a regional basis.

(A. K. B.)

Horses. The number of horses and mules on United Sta
farms continued to decrease in 1942. In its ann
report on livestock, issued Feb. 18, 1942, the department of a
culture estimated the number of horses on farms as 9,856,
compared with 10,214,000 in 1941 and a ten-year (1931–
average of 11,707,000 head; the number of mules, 3,811,00
1942 compared with 3,922,000 in 1941 and a ten-year average
4,677,000. No later figures were issued in 1942, but Wayne D
more, secretary of the Horse and Mule Association of Amer
estimated the number of horses on United States farms as ab
9,700,000 at the end of 1942; mules, 3,630,000. Fewer ma
were bred in 1942, either for horse or mule colts, chiefly beca
of a shortage of farm labour. Many breeders limited the "trav
of stallions in 1942 because of a lack of experienced men to s
with expensive breeding stock. The number of foals in 1942
estimated by Dinsmore as about 500,000; mule colts, about 1
000. Thus the annual death rate of older stock exceeded the
colt crops.

There was some small increase in the number of horses
mules not on farms. These, the Horse and Mule association e
mated, numbered about 400,000 and included horses used in ci
mines, lumber camps and other non-farming places. The incre
however, was not as large as had been anticipated when the
strictions on gasoline, rubber and automobile travel went
effect. Conversion to horse-drawn vehicles was by no means
great as expected because manufacturers of the necessary ho
drawn vehicles could not obtain materials, which were needed
war production. There was also a decline in the use of ri
horses in 1942 because many riding stables were in rural a
difficult to reach. Pack horses and mules found an enlarged
in army service in 1942, apparently unexpectedly, despite
highly-mechanized military transport. Pack animals were fo
particularly adaptable to carrying supplies in South Sea isla
where motorized equipment was difficult to use because of jun
and swamps. U.S. army pictures in newspapers showed pack
mals in use in New Caledonia. The army bought few horse
1942 but a considerable number of pack mules.

Few of the states in 1942 were producing a sufficient num of either horse or mule colts to provide for replacements of work stock on farms, Dinsmore estimated. The exceptions were the range states, such as Wyoming and New Mexico. These states, however, were not relatively large producers of horses and mules.

Wartime restrictions on beef and other meats drew attention in 1942 to the possibility of using horse meat as food in the United States.

Abattoirs were established in several cities for the production of horse meat under United States government inspection. Federal regulations forbade the slaughter and processing of horses in packing houses where cattle, swine and sheep were processed.

Packers expressed extreme doubt that horse meat would have more than a very minor acceptance in the United States, particularly since horses were worth much more as draught animals han as meat animals. For some years one large company had slaughtered about 125 horses a week to be processed as dog food, but horses so processed were old or crippled animals no longer fit for draught service. Another company prepared food for pets and, in addition, shipped considerable quantities of horse meat to Europe. (*See* also SHOWS.) (S. O. R.)

Horse Shows: *see* SHOWS.

Horthy, Stephen (1904–1942), Hungarian vice-regent and eldest son of Adm. Nicholas Horthy, Hungarian regent, was born in Pola, Istria. He was elected permanent ice-regent, Feb. 1942, in line to succeed his father. Shortly fter the start of World War II, he joined the Hungarian air orce. A London dispatch of Aug. 20 reported that he was killed in a plane combat over the Russian front.

Horticulture. World horticulture was placing its emphasis on food production as the year 1942 drew to close. Lack of manpower and mounting transportation difficulties appeared in early summer and increased rapidly. Market ardeners and fruit growers were so loud in their complaints that government stepped in to alleviate the situation in some egree. Growers announced a reduction in acreage devoted to ornamentals and some of them turned over parts of their land for community gardens. Many agencies began active preparations at the end of the year for a widespread campaign to increase the making of home vegetable gardens and to bring about the establishment of community gardens in industrial sections. Florists began cutting their greenhouse production. The department of agriculture in Washington appointed a national advisory committee headed by Governor Prentiss Cooper of Tennessee to aid in developing a home gardening movement.

This situation in the United States ran parallel to the one existing in Great Britain, except that it was somewhat behind the British schedule. Early in the summer the British government announced that landowners would be expected to plow up their lawns and whatever other available areas they might have, to increase the production of vegetables. The food situation in Britain became especially acute by the end of the year, inasmuch as Great Britain was supplying much of the food needed for feeding the American and Canadian troops quartered on English and Irish soil. Six million new acres had been plowed up and thousands of miles of drains laid. Vegetables were grown in public parks everywhere, as well as on golf courses, cricket fields and village greens—even, indeed, in the moat of the Tower of London.

The season favoured British gardeners. Plums and apples once more provided the fresh fruits and jams which the British people crave. However, Britain was still lacking in oranges, lemons and similar fruits, but the fact had been discovered that a syrup from rose hips (fruits) could be substituted satisfactorily for orange juice. A factory in Scotland was taken over by this industry.

Strict control of the bulb industry in England permitted few bulbs for home use, but heavy exports of tulip bulbs and narcissus bulbs to the United States were made. Flower crops in England were reduced to 25% of the total area. Florists, therefore, began growing tomatoes and other food crops in their greenhouses. Nevertheless, the Royal Horticultural society continued to hold flower shows, which were crowded with exhibits and visitors. The curtailment of the florist industry in the United States was on a much smaller scale.

It was almost impossible to get direct information from the continent of Europe, but Holland was reported to have had one of the poorest harvests in history because of insects and diseases,

ICTORY GARDENS added to the U.S. supply of vegetables in 1942. The icture shows apartment-house dwellers of New York city preparing their mall plots which increased rapidly because of lack of control material. Caterpillars stripped the trees and shrubs in Amsterdam in early September and millions of the pests in the streets caused much trouble to pedestrians. They also damaged the food crops. Potatoes were badly affected by disease.

Growing shortages of insecticides and fungicides became a matter of concern in the United States long before the end of 1942, but the department of agriculture announced a program for the purchase and importation of rotenone from Brazil and Peru. This material had come for the most part from the East Indies in the past, but was available in South America in 1942 and hopes were expressed of importing at least 4,500,000 pounds. It was also announced by the government that satisfactory fertilizers would be available for commercial growers but that different and less favourable formulas would be supplied to amateurs.

Fruit growers and market gardeners again turned to women and school boys for the marketing of their crops, a tendency which certainly was expected to increase in 1943. In some sections, schools were closed to permit school boys to work in the orchards and berry fields. A beginning was made in the use of women in greenhouses.

Much attention was given to the production of medicinal herbs in the United States, for importation was impossible after the far east was cut off. Greatly increased prices tempted beginners to grow medicinal herbs, but the project is a risky one unless the grower is experienced. The United States department of agriculture issued a pamphlet on medicinal herbs of commercial importance. It is called "Drug Plants Under Cultivation," or "Farmer's Bulletin 1231."

The seed crop in California was excellent but by no means sufficient to meet the demand. California normally supplies about 85% of the flower and vegetable seeds of the U.S. but was being asked to provide seeds for many foreign countries as well. This was combined with a 60% labor shortage. Contrary to general belief, the Japanese on the west coast were not prominent in seed production, accounting only for about 10% of the total amount raised. California seed was shipped to England, South Africa, New Zealand, Australia, Hawaii and Russia. Hawaii, incidentally, made remarkable strides in the production of vegetables and fruits after the war began. Thousands of lawns were spaded under to make way for tomatoes, peas, beans and lettuce.

Much progress was made in weed control, especially in developing selective products which would kill weeds and not injure cultivated plants. The most important new product was ammonium sulphamate, which is nonpoisonous and noninflammable but highly effective against poison ivy and many other weeds. There was a widespread campaign to eradicate poison ivy because of the many hours of lost labour which it caused, especially in war industries and the newer army camps. The Massachusetts Horticultural society, Boston, Mass., issued a comprehensive bulletin on poison ivy and its eradication.

The fact was announced that borax had been discovered to have unexpected value as a selective weed killer, being useful against both poison ivy and ragweed. However, a campaign for the eradication of ragweed was suddenly checked by the discovery that this weed, which is supposed to cause hay fever, had many useful qualities, producing an oil equal to that of soy beans and providing food for great numbers of birds.

Increased use was made of certain synthetic substances which prevent the early dropping of apples and pears when sprayed on the trees, holding the fruit from 10 days to two weeks longer than usual. This fact enabled the fruit grower to spread his harvest over an increased length of time. The shedding of the foliage of holly and other plants was reduced by the use of these hormones, which were found to have many other uses, such as retarding the sprouting of potatoes and bulbs in cold storag
(*See* also BOTANY.) (E. I. F.)

Hospitalization Insurance: *see* INSURANCE.

Hospitals.

The planning in Great Britain for a post-war vamping of the whole basis of medical care volved the hospitals as well. Already this effected a mark co-ordination of the activities of the voluntary and munici hospitals, the government having already agreed to make tional and local authority funds available to voluntary hospita It was planned that all of the hospitals in an area would be co-ordinated that there might be a more efficient division functions. Surveys upon which would be based regional organi tions were conducted in two large areas. In this development Nuffield Provincial Hospital Trust proved of tremendous assi ance. Hospitals would have a definite place, too, in the co- dinated schemes for health care announced by the Brit Medical Planning commission and by P.E.P. (Political and E nomic Planning). The report on social insurance by Sir Willi Beveridge would still further influence the hospital system providing free hospital as well as other care for practically entire population. In the United States, President Roosevel recommendations for compulsory participation in a contribut hospitalization plan was not implemented. However, Americ Hospital association leaders agreed that the present "Blue Cros hospital care plans must achieve greater enrollment, particula in rural areas, and provide broader benefits if more radical for of sickness insurance are to be forestalled.

In Great Britain, the United States and in Canada, the creasing shortage of personnel and of equipment was a seri handicap during 1942. Boards set up to facilitate the allocat of professional personnel to meet military and civilian nee proved helpful. In Australia and New Zealand the evacuat of casualties from the scattered Pacific battle zone complica the situation for hospitals already understaffed. However, an example of adjustment, the fine new Royal Prince Alf hospital at Sydney took in an American hospital unit of 300 be later raised to 400 beds, yet after reorganization had 25 m beds for their own patients than formerly.

Further progress was made in developing the Inter-Americ Hospital association. The hospital associations and leaders the three Americas strongly supported this movement. Assista was also rendered by the Co-ordinator of Inter-American Affa through the Pan-American Sanitary bureau, at Washington a by the School of Tropical Medicine at San Juan, Puerto Ri Plans were laid for a Hospital institute in 1943 in Mexico Ci

Construction.—Although there was need in most countries much new hospital construction, the shortage of critical materi and of labour made adequate construction difficult. In the Uni States, hospital construction was fifth in the order of prior for welfare protection. Under the Lanham Act (Public Law 13 of 1941 the construction of needed hospitals and health cent approved by the Public Health Service was authorized. As Sept. 1, 1942, the Federal Works agency had in hand the c struction of 50 such new hospitals costing $18,345,000, so 125 additions costing $30,960,000 and 105 health centre proje costing over $5,000,000. Because of the shortage of cert materials the trend was to erect so-called "semi-permane buildings of but one or two stories.

(G. H. AG.

ousing. Following Pearl Harbor, practically no new housing was constructed in the United States for the general blic. No new slum clearance projects were undertaken in 1942. he only housing construction programmed was in military or val or war production areas, to serve the needs of the army, the vy, the Maritime commission and the war industries.

The year 1942 marked the beginning of a co-ordinated govern- ent housing program. On Feb. 24, 1942, the 16 federal agencies d activities dealing with overlapping, duplicating and competi- ve housing programs were merged into the National Housing ency (*q.v.*), created by presidential executive order to admin- er all war housing.

Recognizing the importance of war housing to war production, e NHA administrator was invited to sit with the cabinet. The esident's order, issued under his war powers, was to remain in ect until six months after the end of the war. Any permanent tional housing agency would therefore have to be created by t of congress.

There were three constituent units of NHA: the Federal Pub- Housing authority (FPHA), which in 1942 constructed and naged all public war housing, or delegated these functions to her federal agencies or local housing authorities; the Federal ousing administration (FHA), which insured mortgages on ivate housing and insured loans to finance remodelling to create ditional living units for war workers; the Federal Home Loan nk administration (FHLBA), which dealt with the problems of me financing through the Federal Home Loan Bank system, e Federal Savings and Loan Insurance corporation and the ome Owners' Loan corporation (HOLC).

The organism for an integrated program of public and private using was set. John B. Blandford, administrator of the Na- nal Housing agency stated: "It is a basic policy of the NHA give private industry every opportunity to build as much of e needed war housing as it finds feasible under the necessary strictions such as size, cost, location and occupancy limitations." FPHA and FHA—at the Washington level—worked hand in nd in 1942 to accomplish a mutual goal, but the spirit of co- eration had not yet permeated to all the field offices.

The War Manpower commission and the War Production board *q.v.*) set the pace for war housing construction in 1942. WMC termined the number of people to be brought into an area for dustrial or military purposes. NHA then found out how many isting dwelling units were available and how many new ones d to be built, and programmed them for construction with ivate or public funds. WPB determined the amount of critical aterial that could be allocated to war housing production.

Until the end of 1942, NHA was impeded by the WPB system issuing priorities and attempting to process and administer e distribution of materials instead of allocating them to NHA. PB and NHA, however, worked out their difficulties. NHA s made a claimant agency; sat on the WPB requirements com- ittee; and was given blanket priorities for critical materials, ich it divided among different projects and localities according the need. These arrangements rested on the assumptions that HA would locate housing as near industrial plants as possible, ve due consideration to conservation of materials, and rely upon mporary construction to meet a large share of housing require- ents.

During 1942, 278,000 war housing units of all types were com- eted under preference ratings; 150,000 of these were privately anced family units and 128,000 units were publicly financed; ,000 private units were completed in the early months of the ar without preference rating orders.

FHA had commitments outstanding to insure mortgages financ- g approximately 43,000 units on which construction had not started. FHA emphasis was turned from sale to rental housing because the homes were restricted to the use of war workers coming into communities. There was no surety in 1942 that the war worker would remain permanently in the community. Should the war worker desire to own his home, he could purchase after a period of residence.

The public war housing constructed in 1942 through FPHA included 80,000 family dwelling units, 8,000 war apartments for two-person families, 31,000 dormitories for single workers and 9,000 trailer homes. At the year's end, FPHA had under construction another 144,000 family units, 10,000 war apartments, 52,000 dormitory units and 8,000 trailers.

In preconstruction development, FPHA included 99,000 family units, 18,000 war apartments, 24,000 dormitory accommodations and 5,000 trailers.

At the close of the year, desiring to use every available structure in war production areas to its fullest advantage, NHA launched a War Guest program aimed to house single workers, and—through HOLC—a Homes Conversion program aimed to convert large single-family houses into multi-family apartments. BIBLIOGRAPHY.—Publications of National Housing Agency, the National Committee on the Housing Emergency and the National Association of Housing Officials. (D. RN.)

Great Britain.—Interest in housing in Great Britain during 1942 centred on postwar programs rather than on current building, although a certain amount of what might be called utility housing was carried out in connection with the development of new factory areas.

Housing would obviously have to be the first concern of the government and the building industry immediately after the war. Up to the end of 1942 there had been 2,750,000 houses damaged by enemy action, but of these, 2,500,000 had been repaired and

DETROIT POLICEMEN subduing Negroes in a race riot precipitated Feb. 28, 1942, when 700 white men picketed a new U.S. housing project built for occupancy by Negro families

were again inhabited. This left 250,000 to be added to the shortage already in existence before the war, which had since been increasing.

Almost every society or institution connected with building or planning was making research into housing questions, and many industrial concerns were experimenting in the use of their particular products for housing purposes.

Few results of the experiments had been seen in 1942, although many of the newer methods adopted in building wartime huts and hostels were regarded as offering potential solutions to the problem of rapidly erecting working-class houses as soon as the opportunity arose.

The ministry of health set up a special advisory committee to establish standards for housing, and this committee was gathering information, statistics and recommendations from every available source.

The problem of heating the small house was being considered by many, especially in relation to the possibility of heat supply on a communal basis. There was controversy on the advisability of equipping the small house with built-in furniture. Certainly the furnishing problem was one which would have to be considered in any housing policy, because, on account of the war, furniture making had practically ceased. There was, and would be, a very serious shortage of the type of furniture usually required for smaller houses. The board of trade scheme for the manufacture of "utility" furniture was bound to influence the manufacture of cheaper furniture, particularly because prices under the board of trade scheme were to be pegged and, for the war period anyhow, production limited to certain selected firms.

Those concerned with housing questions were watching U.S. experiments in the provision of housing for war workers, particularly where methods of prefabrication and mass production were being adopted. (F. R. Y.)

Housing Authority, U.S.: *see* NATIONAL HOUSING AGENCY.

Howe, Harrison Estell (1881–1942), U.S. chemist, was born Dec. 15 in Georgetown, Ky. He took his B.S. degree at Earlham college, 1901, and later studied at the University of Michigan. Dr. Howe was consultant in the nitrate division of the army ordnance bureau in World War I; he was again called by the government in World War II to act as chairman of the chemicals group and of the chemicals priorities committee of the OPM priorities division, 1941. He later became chairman of the advisory committee of the chemical section of WPB. On Nov. 6, 1942, he was awarded the Society of Chemical Industry medal for his "valuable application of chemical research to industry." He was the author of several books on industrial chemistry and contributed to many scientific journals. He died in Washington, D.C., Dec. 10.

Hubeny, Maximilian John (1880–1942), U.S. radiologist, was born Oct. 12 in Leipzig, Germany. He went to the United States when a boy and studied medicine at the University of Illinois medical school, from which he graduated in 1909. A specialist in the medical application of X-ray, Dr. Hubeny advanced its use in embryology and obstetrics, in the examination of the head and appendix and in the early diagnosis of pulmonary tuberculosis. He was chairman of several radiological societies, editor of *Radiology*, 1923–31, and gold medallist of the Radiological Society of North America in 1931. From 1936 to 1942 he was director of the X-ray department the Cook County hospital in Chicago. Dr. Hubeny died in C cago, July 2.

Hull, Cordell (1871–   ), U.S. statesman, was born Oc in Overton (now Pickett) county, Tenn. was graduated from the Cumberland university law school in 1 and served as a captain in the Spanish-American War. He ser in congress from 1907 to 1933, except for one brief inter 1921–23. He was elected to the senate in 1931 but resigned 1933 to become President Roosevelt's secretary of state. In nationally, his name became closely associated with the "g neighbour" policy in South America and elsewhere; he was a c sistent foe of aggression in settling disputes. He roundly nounced the Japanese attack on the Philippines and Pearl Har on Dec. 7, 1941, as a "treacherous and utterly unprovoked tack"; he further accused the Nipponese of having been " famously false and fraudulent" by preparing the attack while t envoys were in the United States conducting purported pe negotiations.

On Nov. 8, 1942, the day U.S. troops landed in French No Africa, Hull asserted that this successful invasion vindicated state department's oft-criticized policy of maintaining diplom relations with Vichy. Obviously referring to queries as to whet the Darlan regime would be retained after the war, Hull decla on Dec. 2 that the United States had first to win the war be considering political issues. He condemned the assassination Darlan three weeks later as "an odious and cowardly act."

Hungary. A kingdom in central Europe. Area (1940) 61, sq.mi.; pop. 12,708,439. Capital: Budapest. Cl cities: Budapest (1,115,877); Szeged (131,893); Debrec (122,517); Kolozsvár (100,844); Kecskemét (83,732). Acco ing to official figures published in 1942, the territory acquired Hungary from Yugoslavia in 1941 and called officially "Sou land," contained 339 towns with a population of 1,024,876. a result of this re-incorporation, the population of Hungary 1942 was officially estimated at 14,733,000 in an area of 172, sq.km. Religion: the majority are Roman Catholics, with str Protestant and smaller Jewish and Greek minorities. Ki throne vacant since 1918, royal functions exercised by reg Nicholas Horthy de Nagybánya. Premier (1942): Nicholas Kallay.

History.—In Feb. 1942 the Hungarian parliament passe law which provided for the nomination of a vice-regent, in v of the fact that the regent Admiral Nicholas Horthy was old in poor health. Only the national socialist Arrow Cross pa voted against it. Horthy's eldest son, Stephen, was then elec by acclamation. He was 38 years old, president of the Hungar state railroad and a member of the upper chamber since 1 The new vice-regent assumed his duties March 4, but in Aug he was killed in air combat on the Russian front. His descenda were granted the hereditary title of "serene highnesses."

The third session of the Hungarian parliament, which opened June 14, 1939, was closed Feb. 24, 1942, and the session started March 10. In the intervening period the largest parties, the government party and the Transylvanian pa under the leadership of Count Bela Teleki, entered a coalit and decided on closest collaboration in view of Hungary's m tary effort. On March 7 the cabinet of Dr. László de Bárdo who was also foreign minister, resigned, and on March Nicholas von Kallay formed the new cabinet. He also assum temporarily the foreign office, while all the other ministries mained unchanged. In his first speech the new premier decla that Hungary would continue to fight without the slightest h tion on the side of Germany and Italy.

The relations between Hungary and Rumania continued very rained. It was only with difficulty that open warfare was oided. The violent reaction of all Rumanian leaders to the ss of northern Transylvania to Hungary aroused Hungarian blic opinion. Rumanian complaints about the brutal ill-treat- ent of their compatriots in the Hungarian part of Transylvania ere countered with similar complaints by the Hungarians. Rela- ons with Slovakia and Serbia were only a little less strained. he former minister of justice, von Tomcsányi, was named com- issar of the former Czechoslovakian Ruthenia, or, as it was lled in Hungary, Carpathian land. Milan Popovitch, the only rb member of the Hungarian parliament, revealed the brutality the methods used to suppress an uprising of the Serb popula- on of the Bacska, the Yugoslav province between the Danube d the Tisa rivers. In his reply Premier Kallay had to acknowl- ge not only the extent of the Serb uprising but also that Hun- rians had committed acts of repression for which they were ly punished. Kallay promised that in the future every care ould be taken to avoid similar actions.

During 1942, Hungary's active participation in the war be- me more and more pronounced, especially on the Russian front. Sept. 5 Budapest had its first air-raid alarm. The Hungarian vernment tried to ward off too great demands of the German vernment for more soldiers and more foodstuffs. The German reign minister, Joachim von Ribbentrop, visited Budapest at e beginning of January and was reported to have demanded at the Hungarian army be put at Germany's disposal, while rmany would allow Hungary greater independence in internal airs. A week later Ribbentrop was followed by the Italian reign minister, Count Ciano, and in April the Hungarian chief staff, Field Marshal Franz Szombathelyi, visited Italy.

The close friendship with Germany had no influence on the itude of the Hungarian government to the Arrow Cross party, ich desired to bring about a completely national socialist gime, but was hindered by an internal struggle. The party's der, Ferenc Szálasi, expelled the two vice-leaders, Kálmán bay and General Eugene Ruszkay. The party also opposed e election of a vice-regent. Some members of the party joined e group of former premier Bela Imredy; others emphasized e need for national unity.

In the fall, new negotiations started between Germany and ngary to regulate mutual exports and imports. Two leading rman economic experts, Dr. Walther Funk and Dr. Karl odius, arrived in Budapest to demand that Hungary should d more foodstuffs, hides and other urgently required raw ma- rials to Germany.

Education.—Education is compulsory for children between and 12, while for three more years they have to visit continua- n schools or courses, many of them specialized agricultural ools. Besides these continuation schools and a relatively large mber of special schools, Hungary had, in 1939, 8,103 elemen- ry schools with 23,215 teachers and 1,104,916 pupils. In the ies there existed 418 primary schools with 4,619 teachers and 5,466 pupils. High schools of different kinds numbered 263, th 4,709 teachers and 79,435 students. There are four univer- ies, Budapest, Kolozsvár (Cluj or Klausenburg), Pécs (Fünf- chen) and Debreczen with a total of 7,032 students, of whom 11 were women.

Defense.—On Jan. 28, 1939 Hungary re-introduced compul- ry military service for all men between 18 and 60. Men from to 48 belong to the second, and from 49 to 60 to the third serve. Men unfit for military service become liable to work on blic works. In 1941 there were 8 army corps, and in addition motorized brigades and 2 cavalry brigades. The air force was very small and there was no navy. The budget of 1941 provided 385,000,000 pengoes for national defense.

Finance.—The monetary unit is the pengoe, containing 0.263158 grams of fine gold, equal to 19.77 cents U.S. in March 1941. The revenue for 1942 was estimated at 2,060,000,000, the expenditure at 2,202,000,000 pengoes. The public debt on Sept. 30, 1941 amounted to 3,545,000,000 pengoes. Bank notes in circulation on Sept. 30, 1940 were 1,357,000,000 pengoes. The national bank of Hungary had, as against this circulation, a metal reserve, including foreign exchange, of 166,000,000 pengoes.

Trade and Communication.—Hungary imported, in 1939, 28,600,000 quintals of goods for a value of 489,000,000 pengoes and exported 28,500,000 quintals to a value of 605,000,000 pengoes. Of the imports, almost half the value came from Germany, and half the exports went to Germany. Italy held the second place in 1939, Great Britain the third.

Hungary had 6,307 mi. of railroad in 1939, 2,898 post offices, 6,902 mi. of telegraph lines and 20,976 mi. of telephone lines.

Agriculture, Industries, Mineral Production.—Hungary's main production is agriculture. In the fertile plains of the Danubian basin potatoes, maize, wheat, sugar beets, rye, barley and grapes are grown. Hungary is rich in forests, pigs and cattle. It has a wealth of good coal and important bauxite deposits. Industrial development has only started recently. Most of the industries are connected with agriculture. Hungary produced in 1939 10,625,452 tons of coal, 500,193 tons of bauxite, 409,292 tons of pig iron and 732,615 tons of steel. (*See* also RUMANIA; WORLD WAR II.) (H. Ko.)

Ice Hockey.

The National league, major circuit of professional hockey, experienced one of its more unusual seasons during 1942. The New York Rangers won the league championship, but could go no further than the semi-finals in the Stanley cup playoffs. The Toronto Maple Leafs, victors over the Rangers in the cup playoffs, went on to win the Stanley cup in the final series against the Detroit Red Wings. In keeping with the dizzy season, Toronto managed to lose the first three matches of the series, then won four straight to regain the trophy it last won in 1932. More than 1,860,000 admissions were paid for the National league and Stanley cup season of 1941–42.

The American league title went to Indianapolis on the strength of three victories in the five-match playoff series against Hershey, Pa. Omaha won the American association championship by taking three straight in its playoff with Kansas City. The Eastern league crown went to the New York Rovers.

Amateur hockey continued to flourish in spite of war curtailments. The Royal Canadian Air Force captured the Allen cup, awarded annually to Canada's amateur champion. The Memorial trophy, emblematic of the Canadian junior hockey championship, was won by Portage La Prairie, Manitoba. Boston college dethroned St. Nicholas as champion of the National A.A.U. hockey tournament, defeating the defending titlist in the final, 6 to 4. Dartmouth returned to first place in the Pentagonal league, replacing Harvard.

Numerous changes marked the opening of 1942–43 professional hockey. The American association, made up of Midwestern cities, disbanded. The American league in the east reduced its teams from 10 to 8. The National league dropped one franchise, Brooklyn, and went along with six teams—Toronto, New York, Montreal, Chicago, Detroit and Boston.

Defenseman Tom Anderson of the Brooklyn Americans won the Hart trophy as the player most valuable to his team in 1941–1942. Frank Brimsek of Boston easily won the George Vezina cup as the National league's best goalie. He allowed only 118 goals to pass into his nets, as compared to 136 by "Turk" Broda, his nearest competitor and the 1941 Vezina trophy winner. Grant Warwick, left wing of the New York Rangers, was voted the outstanding rookie of the National league, while Syl Apps, Toronto centre, won the Lady Byng trophy as the player with the best conduct on the ice. (M. P. W.)

Iceland. An island state of the north Atlantic. Area, 39,709 sq.mi.; pop. (1939 est.) 120,264. Capital, Reykjavik, the only large town (pop. in 1939, 38,219). Religion, Lutheran Christian. Rulers: hereditarily united with Denmark, Iceland became an independent state Dec. 1, 1918, legally united with Denmark only by recognition of a common king. After April 9, 1940, the executive power was wielded by the Icelandic ministry, with a regent, Sweinn Björnsson.

History.—In April 1942 Major Gen. Charles H. Bonesteel of the U.S. army replaced Gen. Henry Osborn Curtis of Great Britain in command of United Nations' forces in Iceland. Gradually British troops were removed, and by autumn U.S. troops were the sole occupying forces.

Internal political difficulties were heightened by Iceland's position in the war. Prime Minister Hermann Jonasson resigned in May and was succeeded by Olafur Thors. But this government found it impossible to hold the confidence of a majority of the Althing (parliament), and on Dec. 16 the regent asked Dr. Björn Thordarson to form a provisional nonpartisan government. The elections of Nov. 1942 returned 20 Independence party members, 15 Progressives, 10 Communists and 7 Labourites to the Althing.

On May 17 the Althing passed two significant resolutions: that Iceland did not intend to renew the union with Denmark when it expired on Jan. 1, 1944; and that Iceland intended to become a republic.

The social problems of military occupation in a small country were accentuated by the economic problems of the inflationary trend. In Reykjavik the cost of living index soared (using Jan.–March 1939 as 100) from 146 in Jan. 1941 to 183 in Jan. 1 and up to 210 in Sept. 1942. Iceland was enjoying the m prosperous period in its history, yet serious unbalance w threatened by the rapid price changes.

Finance.—Monetary unit: krón=18 U.S. cents (1939), ab 15.5 U.S. cents in 1942; in 1939 government revenues w 19,930,879 krónur (and estimated for 1943 at 33,736,100 kr expenditures, 19,378,318 kr. (and est. for 1943 at 28,333, kr.); national debt (1939), 56,648,000 kr.; notes in circulati 14,000,000 kr.; gold reserve, 5,762,000 kr.; bank capital a reserves, 17,577,000 kr.; bank deposits, 76,720,000 kr.; to bank funds, 48,997,000 kr. Bank deposits were 303,034,000 in Aug. 1942. Note circulation jumped from 24,580,000 kr. Jan. 1941 to 78,910,000 kr. in Aug. 1942; loans in the sa period from 92,137,000 kr. to 147,577,000 kr., and savings posits from 18,526,000 kr. in Jan. 1941 to 29,403,000 kr. March 1942. Gold reserves and bank capital remained practica at the 1939 figures.

Trade.—Exports in 1939 totalled 69,654,000 kr.; chief artic of export were fish, salted and dried (17,228,000 kr.); fish (12,491,000 kr.); herring (11,800,000 kr.); fresh fish (8,988,0 kr.); fish flour (7,291,000 kr.); sheepskins, etc. (3,309,000 kr Imports in 1939 totalled 61,639,000 kr. The chief imports w gasoline (9,672,000 kr.); textile manufactures (6,583,000 kr metal wares (5,182,000 kr.); wood (5,483,000 kr.); machi (4,727,000 kr.); automobiles, etc. (3,638,000 kr.). Great Brit took most of Iceland's exports in 1939 (11,794,000 kr.), follow by Sweden (8,517,000 kr.); Denmark (7,708,000 kr.); Germa (7,488,000 kr.) and the United States (7,378,000 kr.). Gr Britain also was first in supplying Iceland's imports, with goo valued at 13,785,000 kr. Denmark was second (12,684,000 k and Germany was third (10,125,000 kr.).

The years 1941 and 1942 show some significant contrasts w the peacetime balance depicted in the above paragraph. Expo rose steeply in value: 188,504,000 kr. in 1941, about two a one-half times the value of 1939; in 1942 the figure was 148,22 000 kr. for only January through August. In 1941 a large cre balance was allowed to accumulate, but in 1942 Iceland beg to import goods almost to the extent of its sales, having

DOME-SHAPED SHELTERS of the U.S. Iceland Base command

NAVY SUPPLY SHIP dragging its anchor during a gale along the coast eland in Jan. 1942

ourable balance of only 9,080,000 kr. at the end of August.

ommunication.—Highways (1936) totalled 2,728 mi., of ch 1,736 mi. were improved and 992 mi. were unimproved. es of telegraph lines (1939): 9,700. Military occupation led unrevealed new construction.

griculture.—In 1938 the chief products with their yields tons were as follows: hay (269,024), potatoes (13,160), nips (2,856). (F. D. S.)

Skating.

Ken Bartholomew of Minneapolis and Carmelita Landry of Fitchburg, Mass., retained ir senior speed skating supremacy with victories in both the ited States and North American amateur championships. In eating their double conquests of the country's two major out- r meets, the youthful pair demonstrated the hard and easy s of winning championships. Miss Landry had little trouble ning the women's senior titles, sweeping all five events in each t. Bartholomew, on the other hand, was extended to the last es to score his double.

Herman Van Putten, New York city bridge painter, captured minor skating titles—the North American indoor and the r-city silver skates. Mrs. Elaine Bogda Gordon, a Chicago sewife, won the women's indoor speed skating title. The Mid-Atlantic senior championships were won by Leo Lavalle, Paw- ket, R.I., and Virginia Jahn, Cresskill, N.J.

Robert Specht, a 21-year-old Chicagoan who later turned pro- sional, captured the men's senior figure skating title of the ted States. Specht easily outscored the field in the difficult ool figures, and then matched his closest opponent, Arthur mditch of Philadelphia, in the colourful free-skating competi- . Mrs. Jane Vaughn Sullivan of Philadelphia retained the men's senior championship, while Walter Sahlin of Minneapolis Dorothy Goos of New York won the national junior crowns. (M. P. W.)

aho.

One of the far northwestern states belonging to the group regionally designated as the Pacific northwest. ho was admitted to the union on July 3, 1890, and is popu- y known as the "Gem state." Area, 83,888 sq.mi.; pop. (1940) ,873, of which 66.3% was rural, 33.7% urban. There were 38 Indians in the state. Principal cities are Boise, the capital ,130), Pocatello (18,133), Idaho Falls (15,024), Nampa (12,) and Twin Falls (11,851).

istory.—State officers elected Nov. 3, 1942 were as follows: ernor, C. A. Bottolfsen (R); lieutenant-governor, Edward son (R); secretary of state, George H. Curtis (D); attorney eral, Bert H. Miller (D); auditor, Calvin E. Wright (D); su- intendent of public instruction, C. E. Roberts (D); mine inspector, Arthur Campbell (D). The 27th legislative session convened Jan. 4, 1943, with a Republican majority in both houses. The budget placed before the body called for drastic reduction in expenditures.

Education.—The school population in 1942 was 120,029. There were 79,771 pupils in elementary schools; 9,672 in junior colleges and 30,586 in high schools. The state university is at Moscow, the southern branch of the state university at Pocatello; there are two state normal schools, one at Lewiston and one at Albion.

Charities and Correction.—The state industrial training school is at St. Anthony and the penitentiary at Boise. There was little change in the average number of inmates during 1942—approximately 175 at the former and 250 at the latter. There are two institutions for the insane; one at Blackfoot and the other at Orofino. There is also a home for the feeble minded at Nampa.

Communication.—There were 4,910 mi. of state highway and approximately 33,000 mi. of county and forest roads June 30, 1942. There were approximately 2,890 mi. of railroads in 1942; there were eight major airports under government control and many emergency and forest landing fields. In 1942 there were approximately 65,000 telephones in use, with a line mileage of 150,543. Telegraph mileage was 8,226.

Banking and Finance.—On Dec. 31, 1942, there were 33 state banks with capital of $1,275,000 and surplus of $963,600. As of June 30, 1942, there were 53 national banks with capital of $3,730,000 and surplus of $2,713,800. The state's total assessed valuation was $400,236,991. The state treasurer's receipts for 1942 were $38,976,612; disbursements $37,932,574; total bonded debt on Dec. 31, 1942 was $1,735,600.

Table I.—*Principal Agricultural Products of Idaho, 1942 and 1941*

Crop	1942 (est.)	1941
Wheat, bu.	21,722,000	27,822,000
Corn, bu.	2,520,006	2,385,000
Oats, bu.	8,000,000	6,680,000
Barley, bu.	14,874,000	11,400,000
Sugar beets, tons	1,160,000	823,000
Dry beans, 100-lb. bags	2,072,000	1,888,000
Seed peas, bu.	1,690,000	1,016,000
Hay (all kinds), tons	2,306,000	2,391,000
Potatoes, bu.	30,360,000	27,450,000

Table II.—*Principal Mineral Products of Idaho, 1941 and 1940*

Mineral	Value, 1941	Value, 1940
Gold	$ 5,250,000	$ 5,075,000
Silver	11,808,000	12,250,000
Copper	912,600	757,100
Lead	11,592,000	10,380,000
Zinc	11,795,999	9,184,500

Agriculture.—The total value of crops in 1941 was $89,587,000 as compared with $61,744,000 in 1940.

Manufacturing.—There were 533 manufacturing establishments (1940) with 12,797 workers and a payroll of $16,249,685.

Mineral Production.—Total value of mineral production for 1941 was $41,357,800 for the five leading metals. In 1941 there was the largest output of gold since 1871

C. A. BOTTOLFSEN, Republican, elected governor of Idaho Nov. 3, 1942 and the largest production of zinc in the history of the state. Figures for 1942 were unobtainable because of federal regulations. (B. De.)

Illinois.

A north central state of the United States, admitted to the union in 1818, nicknamed the "Sucker state," sometimes called the "Prairie state." Total area, 56,400 sq.mi. of which 55,947 sq.mi. are land. Pop. (1940) 7,897,241, including 3,967,481 males and 3,929,760 females; 7,503,987 white, 393,254 nonwhite. Population classed as urban was 5,809,650, rural not on farms 1,121,823, rural farm 965,768. The census bureau estimated the 1942 population at 8,008,067. Springfield, the state capital, with a population of 75,503, is the fifth Illinois city in size. Chicago (3,396,808) is the largest Illinois city, followed by Peoria (105,087); Rockford (84,637); East St. Louis (75,609).

History.—Military mobilization and war production dominated the Illinois scene in 1942. The Great Lakes Naval Training station was supplying numerous navy personnel, Camp Grant was one of the largest army receiving centres and Ft. Sheridan an important army headquarters. The huge ordnance depot at Savanna, the Kankakee Ordnance works, the Elwood Ordnance plant and the Illinois Ordnance plant at Marion were all in production, while the historic arsenal at Rock Island was vastly expanded. Chanute Field near Rantoul and Scott Field near Belleville were centres of intense and ever expanding aviation activity. The available manpower of the state over age 20 was very largely mobilized under selective service, and voluntary enlistments of younger men numbered scores of thousands. By Dec. 1, 1942, a total of $617,475,000 in war bonds had been absorbed by private buyers, and the state's financial institutions had taken billions.

In the elections of 1942 the Republican party made gains. U.S. Senator C. Wayland Brooks, at the head of the Republican ticket, defeated Raymond S. McKeough, Democrat, for the junior U.S. Senatorship by a vote of 1,582,887 to 1,380,011. Republicans gained 3 U.S. Representatives, electing 19 to 7 Democrats. The entire Republican slate for state offices was elected. The vote cast was the smallest since 1934.

Dwight H. Green was governor of Illinois in 1942; Hugh W. Cross, lieutenant governor; Edward J. Hughes, lone Democrat official, secretary of state; Arthur C. Lueder, auditor; Warren Wright, treasurer; and George F. Barrett, attorney general.

Education.—Enrolment in 11,996 Illinois school districts, according to the latest figures available in 1942, was 1,287,085 of whom 379,163 were in secondary schools. Teachers numbered 49,132. Current expenses were $117,493,670 from the educational fund, $9,204,234 from the building fund, total $126,697,905.

Public Welfare, Charities and Correction.—Persons receiving public assistance in Illinois, under all five programs in course, had declined by 326,023 at the close of 1941 and this trend was steady throughout 1942, with WPA almost liquidated.

Cost of old age, blind and dependent children aid since April 1, 1936 had been $171,635,982. The 200,000 persons on those programs in 1942 received approximately one-fifth of the money provided by the state budget. The Division of Prisons operated five institutions with 11,094 inmates and 1,287 employes. The appropriation for maintenance was approximately $3,500,000 per year; the per capita cost per prisoner about $264 per year.

Communication.—The network of high type highways in Illinois comprised 13,683 miles in 1942, connected to about 56,000 miles of lower type road. The direct state expenditure on the system was $17,435,000 per year (exclusive of federal and local funds). The railway mileage of Illinois in 1942 was about 11,500 miles.

Banking and Finance.—National banks of Illinois numbered 339, deposits, $3,307,071,000, investments $1,866,452,000. State banks and trust companies numbered 495, deposits $1,249, 000, investments $594,581,000.

Money appropriated by the state legislature for the bie period July 1, 1941-June 30, 1943 totalled $523,907,802. Rec of the State Treasury for 1941 were $374,029,810. Tax rec of 1942 exceeded budget estimates, the reduced sales tax fo fiscal year 1942 netting $85,589,258 against anticipatory esti of $65,000,000. The bonded debt of Illinois was $149,461

Agriculture.—Illinois crops harvested in 1942 were $623,295,000, fourth largest gross value on record. The ac harvested was 19,236,600. Cash farm income for 1941 from and livestock was $703,000,000, exclusive of AAA govern payments. The latter approximated $30,000,000. The weath 1942 caused a high yield of corn and soybeans, a very wheat crop and a fruit tonnage 14% below average.

Table I.—*Leading agricultural products of Illinois 1942 and 1941*

	1942	1941
Corn, bu.	433,438,000	409,213,000
Soybeans, bu.	73,794,000	49,098,000
Oats, bu.	141,320,000	153,467,000
Winter wheat, bu.	12,623,000	34,080,000
Tame hay, tons	3,942,000	3,680,000

Manufacturing.—The value of products manufactured in nois in 1939, according to the U.S. biennial census, was $4, 860,733; the number employed was 688,800; total wages salaries were $988,453,881. The principal industries and the of their products were as follows: meat packing, $479,501 steelworks and rolling mills, $207,301,815; petroleum refi $122,933,528; tractors, $121,550,621.

Table II.—*Production of Coal and Petroleum in Illinois, 1940 and 193*

	1940	1939
Bituminous coal, tons	45,977,479	47,627,45
Petroleum, bbl.	140,788,000	94,912,00

Mineral Production.—The total value of minerals prod in Illinois in 1939 was $210,295,738. (L. H.

Illinois, University of.

In 1942 the university mad greatest contributions to vi and post-war progress through the activities for which it best prepared by experience and equipment—education an search. War service leaves were granted (as of Dec. 1, 194 425 staff members.

A major contribution to war production was the trainin 10,000 persons in 45 Illinois war-factory communities thr the engineering, science and management war training, fina by the federal government and supervised by the unive The U.S. navy established one of its large training station the campus. Both officers and enlisted men attended signal diesel engineering schools. Navy personnel in training at time numbered 2,000; total trained annually, 9,000.

The wartime "speed-up" of regular instruction was conti A four-quarter system was established for the colleges of cine, dentistry and pharmacy in Chicago. At Urbana, the su session in 1942 was lengthened. A plan was adopted, effe June 1, 1943, for a three-semester academic year on the down- campus; students may thus graduate in three years or Enrolment in the reserve officers' training corps reached a high of 4,779, including 778 juniors and seniors in the adva course leading directly to commissions.

Early in 1942 the 20,000,000-volt Betatron was put into o tion on the campus. The instrument was designed by Donald W. Kerst and was considered the outstanding dev nt in atomic physics in more than a decade. It is a high-tage "atom-smasher" whose power can be precisely controlled, l the world's most powerful X-ray. Facilities of the college medicine were expanded by the opening of the Neuropsychi-ic institute of the Illinois state department of public welfare, ffed by the university, and the taking over by the university of Illinois Eye and Ear Infirmary in Chicago.

The university budget for 1942–43 was $10,734,672, of which 606,463 was to come from state tax revenues. For statistics enrolment, faculty, endowment and library volumes, *see* IVERSITIES AND COLLEGES.

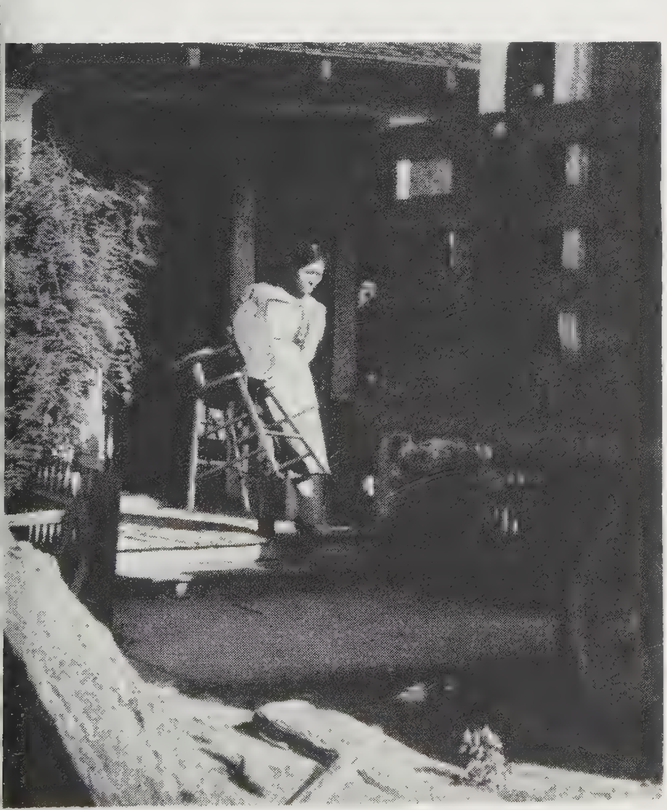
migration and Emigration, U.S.

The immigration and emigration of ns are controlled in the United States by laws and treaties l by regulations based thereon, and are under the direction of commissioner of immigration and naturalization in the depart-nt of justice. Aliens seeking to enter the United States for manent residence are limited as to quality by the act of . 5, 1917, which requires that they meet certain standards, ntally, physically, morally and economically. The Quota act sed on May 26, 1924, limits the number that may enter for manent residence from certain countries.

During the fiscal year ended June 30, 1942, officers of the nigration and naturalization service passed upon 44,899,283 sons' entries into the United States. Of these 43,679,900 were oss land borders, including 5,253,535 alien entries and 12,227,- entries from Canada, and 15,721,746 alien entries and 10,- ,431 citizen entries from Mexico (making a total of 20,975,281 ns and 22,704,619 citizen entries across both land borders). Alien entries for permanent residence numbered only 28,781 the fiscal year ended June 30, 1942, a decrease of 22,995 from the fiscal year 1941 and the second lowest number to take up permanent residence in the United States during any fiscal year since 1831.



ANESE HOUSEWIFE moving from her home on Terminal Island near San ro harbour, Calif., in Feb. 1942 after the U.S. government had ordered the cuation of aliens. Later all Japanese, German and Italian aliens were moved

Quota immigrants numbered only 14,597 although under the law 153,774 quota immigrants could have been admitted. Only 7,363 emigrant departures occurred during the fiscal year of 1942, the lowest number since 1908 when records of departure were first made. Immigration of permanent residents exceeded emigration by only 21,428.

During the period 1,833 aliens were excluded. There were 40,653 vessels boarded and 1,661,582 alien and citizen seamen inspected. The immigration border patrol officers patrolled 11,854,842 mi., examined 4,736,341 conveyances, and questioned 13,240,125 persons which resulted in the apprehension of 15,237 persons and the seizure of 192 conveyances. During this period 3,709 aliens were deported from the United States and 6,904 who had been adjudged deportable were allowed to depart at their own expense without warrants of deportation. India.

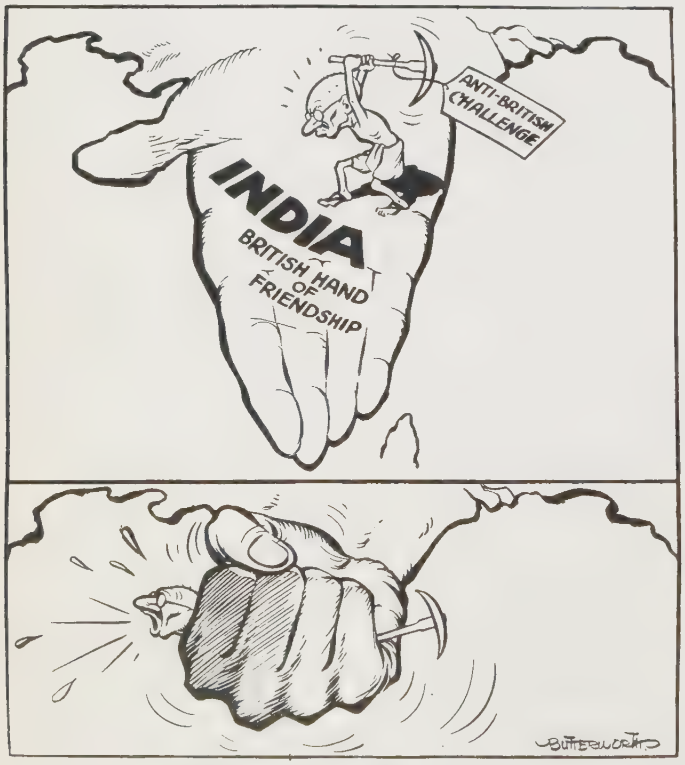
A sub-continent projecting from the mainland of Asia, India lies between the 8th and the 37th degrees of north latitude. It comprises 11 major or "autonomous" provinces, five minor areas directly administered by the central British government and a large number (between 500 and 600) of states under Indian rulers. The latter are scattered about the sub-continent and vary greatly in size and importance, as well as in the powers enjoyed by their chiefs. British India (the 16 major provinces and minor areas) has its capital at New Delhi and is under a viceroy and governor-general (the marquess of Linlithgow, appointed in April 1936), who is also the representative of the crown in its relations with the native states. The total area is 1,575,187 sq.mi., of which the native states and agencies total 712,508 sq.mi.; pop. (est. 1941 census) 388,800,000. Chief cities (pop. census 1931): Calcutta (1,485,582); Bombay (1,161,383); Madras (647,230); Hyderabad (466,894); Delhi (447,442); Lahore (429,747). Languages: Hindi, Bengali and Urdu the most important; religions: Hinduism (approx. two-thirds), Mohammedan (approx. one-fifth). Ruler, George VI, emperor.

History.—In 1942 the Indian sky was darkened by two heavy clouds—the threat of invasion by Japan, and the rejection by the Indian political leaders of a new constitution offered them by the British government. The Japanese menace evoked prompt and loyal support for the United Nations from the princes, from the fighting classes and in the manufacturing ability of the country; the wordy warfare of the politicians was conducted as if the actual clash of arms were raging on another planet.

At the end of 1942 the impasse between the government and the congress was complete. The passive resistance internees, including Abdul Kalam Azad, the president of the congress, and Jawaharlal Nehru, were then released from their brief incarceration; and the viceroy (Lord Linlithgow) broadcast yet another unavailing call for unity and support of the allied war effort. India was invited to send representatives to the war cabinet in London and to the Pacific war council; and in Feb. 1942 Chiang Kai-shek, the Chinese generalissimo, visited India and issued a stirring appeal for a united front against the axis in its assault upon the freedom of the peoples of Asia. All to no purpose. Although some apprehension was aroused by a statement of Winston Churchill regarding application of the Atlantic Charter to India, the essential issue was not long to remain in suspense. On March 11, 1942, the prime minister announced in the house of commons that Sir Stafford Cripps, formerly an advanced member of the socialist party and later British ambassador to the U.S.S.R., was starting for India with a complete project of constitutional reform for discussion with the Indian leaders. On March 23 Sir Stafford reached Delhi, and his offer was released on the 29th. By April 11 it had been rejected and was withdrawn, and Sir Stafford left for London at once.

The intervening fortnight had been one of strenuous endeavour to reconcile the leaders of the political parties: but they had never met among themselves. The Declaration, as the project was styled, had been drawn in London in a hopeful spirit of compromise: it evoked in Delhi no corresponding spirit among the parties which it was intended to satisfy, no detachment from communal interests, little constructive thought for India and her future. Falling into two parts, the proposals dealt, first, with the completely new political status of India after the war and, then, with the measures of provisional advance that would be possible while war continued. It was on the latter that the party leaders for a time concentrated their opposition. The British government had declared that, during the critical time facing India, Britain must remain responsible for the conduct of the country's defense as part of its world war effort; but that in all other respects it would welcome the full co-operation of Indians in the central administration. As explained by Sir Stafford Cripps, this meant that the commander-in-chief must remain the war minister, responsible for the portfolio of defense; but that all the other posts in the viceroy's cabinet might be held by Indians. Resentment was expressed that Indians should be singled out as incompetent to fill one particular office; and Sir Stafford was well on the way to an arrangement which would get over this difficulty.

The grievance, however, was nothing but a feint. The permanent postwar constitutional proposals were what the political leaders had determined not to accept, and they ultimately said so.



"THE FRIENDLY HAND CAN ALSO BE FIRM": a British reminder to Gandhi in Aug. 1942. Cartoon by Butterworth from the Manchester *Daily Dispatch*

These proposals, and the reasons given in the first instance rejecting them, may be thus stated:

1. Immediately after the close of the war, an elected b would be set up to design a new constitution for an Indian un federal in type, with the same status in the commonwealth as existing dominions. The electoral college would be the mem of the lower houses of all the provincial legislatures, and re sentatives would be added from states wishing to particip Here in effect was the constituent assembly for which the cong had always pressed, and in this form exception could hardly taken to it, though the congress demurred to the inclusion "palace nominees" from autocratic states.

2. Subject to 3 and 4 below, the British government undert to accept whatever form of constitution this body might fra No promise could be more definite. It gave the full prospec dominion status, which in turn implied, as Sir Stafford was c ful to point out, the right of the new dominion to secede f the British empire if it wished. Objection thus was difficul formulate; but the Muslims had made it clear that they would accept from the constitution-making body any majority deci in which they did not concur.

3. Any province unwilling to accept the new constitution an enter the union would be at liberty to stay outside and fram separate constitution for itself: similarly, any state desirou contracting out could do so and have its treaty status suit adjusted. This was the response of the British governmen the Muslim demand for Pakistan (*see* below): but the Mus did not consider it sufficiently categorical, the congress demned it as shattering the unity of India, and the Sikhs nounced it as a betrayal of their community because it w place their home province, the Punjab, under Mohammedan

4. With the new union when constituted, the British gov ment would conclude a treaty, making the transfer of power c plete, and providing protection for racial and religious minori Sir Stafford was asked if this provision was intended as an brella for British commercial interests, and answered in the n tive.

These then were the salient features of the Declaration, the reasons given throughout the discussion for its rejection. to the eleventh hour accommodation seemed possible: and an other conciliatory influences Louis Johnson, Mr. Roosevelt's resentative in India, took an active and helpful part. On Apri however, all disguise was thrown aside, and the congress infor Sir Stafford that it would negotiate no further unless a coal government were set up at once, consisting entirely of In members, subject to no control by the viceroy or the Br parliament, and responsible for the whole administration of country. To this Sir Stafford's reply was final: a tremen constitutional change of the sort could not be effected in middle of the war; and in any case it meant that "a nomin cabinet (nominated presumably by major political organizati would be responsible to no one but itself, could not be remo and would in fact constitute an absolute dictatorship of majority." Mohammed Ali Jinnah, president of the Mu league, subsequently endorsed this, stating that he would n enter a coalition government unless the Pakistan scheme accepted. The Declaration was accordingly withdrawn, th the door to negotiation remained open.

At this point a brief diversion on Pakistan may be useful. some time, under the dominant personality of Jinnah, Mu opinion had been hardening in favour of a partition of India tween its two great communities, into Hindustan (the countr the Hindus) and Pakistan (the country of the Pure). The la would stretch across the northwest of India, with an eastern in Bengal, and would form an independent Asiatic state wit

IOUS RIOTING broke out in Bombay and other cities of India Aug. 10, 2, the day after Gandhi's arrest by the British

re in an all-India union. It would be a somewhat amorphous ritory, and, unless supplemented by vast and forcible transfers population, it would contain large Hindu and other minorities which no safeguards had been suggested. Despite its vague-s, the idea became a battle-cry. "Without it," cried Jinnah, e Muslims will be absolutely wiped out of existence."

fter the departure of Sir Stafford Cripps, Gandhi at once took field. His first stroke was to expel from the congress organ-tion one of its staunchest supporters, C. R. Rajagopalachari, me minister of Madras, for the crime of having proposed an e-branch to the Muslims. His next move was to publish the owing statement: "The presence of the British in India is an itation to Japan to invade India: their withdrawal would re-ve the bait"; and to follow this by a call for open rebellion "of urely nonviolent character." Protests immediately poured in m the Muslims and most of the other political groups: but on g. 8 the congress authorized the starting under Gandhi of "a ss struggle on nonviolent lines on the widest possible scale" inst the government. The body which had to deal with this llenge was the viceroy's cabinet, which in July 1942 had been arged from 12 to 15, and now consisted of 11 Indians and 4 tish members. They showed no hesitation in meeting the eat: the congress and its committees were declared illegal lies, and Gandhi, Azad, Nehru and others were placed under ention. Outbreaks of lawlessness started at once. Though ac-npanied by the usual features of such risings—murders, arson, acks upon police stations, etc.—this outbreak had a sinister ciency of its own—a systematic sabotage, well financed and efully prepared at strategic points, clearly designed to imperil defense of the country. To restore order took over six weeks l the calling out of troops in 60 cases to help the police. It is imated that 2,000 casualties occurred among the rioters, and nage to the extent of £750,000 was caused to railway property ne.

Turning the page from the political to the military annals of year, we find a very different picture. "The Indian army," d a message from the king in June, "has won fresh laurels and v glory in many battlefields." In numbers at the close of 1942 army exceeded 1,000,000 men, and recruits were pouring in at the rate of 60,000 a month, faster than equipment could be provided for them. The replacement of British by Indian officers in Indian regiments, and the training of the latter, were making rapid strides; and the first Indian officer to command a regular Indian unit was Major K. M. Cariappa, who had taken over a battalion of the 7th Rajputs. The field of recruitment was much enlarged, an Indian Christian battalion, for example, having been raised in the Punjab, and a number of castes which were formerly excluded from the army were being freely drawn upon. Besides her contribution in fighting men, India was making a dramatic advance in the manufacture of war material: and had become the main arsenal for the middle and far eastern armies of the commonwealth. The catalogue of its output was endless; from parachutes to toluene, from boots to minesweepers. Up to the end of 1941 the value of war orders placed in the country aggregated 230 crores of rupees ($700,000,000).

One paradoxical consequence of the war is thus that India was being converted from a debtor to a creditor nation. She was being paid for her war orders from outside; and no part of the expenditure upon Indian troops operating beyond her borders was charged to her revenues. (*See* also BURMA; WORLD WAR II.) (ME.)

Education.—(1938–39): Number of recognized institutions in British India (excluding Burma) 211,192; scholars in recognized institutions: primary, males 9,407,782; females 1,462,263; middle, males 1,150,272; females 179,506; high, males 1,059,909; females 115,341. Unrecognized institutions, 19,354. Universities, British India 15, native states 3; total number of students, 140,461.

Finance.—Revenue, central government (est. 1942–43) rupees 191,48,07,000; expenditure, central government (est. 1942–43) Rs.226,54,91,000; public debt (March 31, 1940): in India Rs.450,-23,00,000; in England £280,100,000; notes in circulation (May 31, 1942) Rs.460,60,00,000; reserve (May 31, 1942) gold Rs. 44,42,00,000, silver rupee coins Rs.27,90,00,000, sterling securities Rs.318,60,00,000. Currency: 1 rupee (Rs.1); Rs.100,000 = 1 lakh, written Rs.1,00,000; Rs.10,000,000 = 1 crore = 100 lakhs, written Rs.1,00,00,000; one hundred crores is written Rs.100,00,00,000. Exchange rate (average 1941) Rs.1 = 1*s.* 6*d.* = 30.14 cents U.S.; (July 1942) Rs.1 = 30.12 cents.

Trade and Communication.—Overseas trade (1941–42): imports, merchandise Rs.173,29,68,523; exports, Indian merchandise Rs.237,22,28,388; re-exports, merchandise Rs.15,32,63,725; gold coin and bullion (1939–40), imports Rs.1,32,72,707; exports, Rs.36,00,26,302; imports of Afghan merchandise (1939–40) Rs. 3,97,06,671; exports of Indian produce to Afghanistan (1939–40) Rs.72,79,399.

Indian Imports and Exports 1941-42

Japan	11,78,58,746	4,59,24,528
U.S.A.	34,60,80,194	46,39,73,606

Communication.—Roads (March 31, 1938) British India only, 83,612 mi. motorable roads, 201,701 unsurfaced. Railways (March 31, 1940) route mileage: broad gauge 21,154 mi.; metre gauge 15,899 mi.; narrow gauge 4,103 mi. Shipping, tonnage entered (monthly average 1939) 924,200; tonnage cleared (monthly average 1939) 917,500. Motor vehicles licensed (March 31, 1940): British India 94,788 cars and taxis; 43,187 commercial vehicles; 8,602 motorcycles. Wireless receiving set licences, all India (Jan. 1941) 121,534. Telephones (March 31, 1940): 86,219 straight-line connections, 626 exchanges.

Agriculture, Manufacturing, Mineral Production.—Production (in metric tons): rice (1940–41) 33,332,800; wheat (1940–41) 10,957,100; cane sugar, raw (1939–40) 2,770,000; maize (1937–38) 2,080,800; barley (1938–39) 2,119,500; jute (1940) 2,280,000; coal (1940) (British India) 26,496,000; iron ore (metal content) (1939) 1,994,000; pig iron and ferro-alloys (1939) 1,785,000; steel (1939) 1,035,000; petroleum, crude (1940) 325,000; cotton, ginned (1940–41) 1,049,600; groundnuts (1940–41) 3,528,700; tobacco (1939–40) 495,800; tea (1940) 174,800; manganese ore (metal content) (1939) 430,000; linseed (1940–41) 473,500; gold (1940) 9,000 kg.; bauxite (1939) 9,100; chrome ore (chromic oxide content) (1939) 25,000; rape seed (1940–41) 1,135,900; sesamum (1940–41) 408,200. Industry (excluding Burma): cotton (1939–40) yarn spun 1,233,686,576 lb.; woven goods 4,012,529,025 yards; number of mills 388; average number employed 430,165. Jute (1937–38): mills 105; average number employed 309,000. Total number of factories (1939) 10,466; average daily number employed (1939) 1,751,137.

Indiana.

A north central state, Indiana was admitted into the union Dec. 11, 1816, the date observed as Indiana day. Indiana was the 19th state in order of admission. The popular name of the state and its inhabitants is "Hoosier"; the origin (in the 1830s) of the term is unknown. Area, 36,291 sq.mi., of which 86 sq.mi. exclusive of its Lake Michigan jurisdiction are water surface. The population by federal census of 1940 was 3,427,796, of which 44.9% was rural and 55.1% urban; 96.3% of the population in 1940 was native white, 3.6% Negro, and 3.2% foreign born. The percentage of Negro population ranged from zero in some localities to 18.3% in urban areas. Indianapolis, the capital, had a population (1940) of 386,972. Other cities are Fort Wayne (118,410); Gary (111,719); South Bend (101,268); Evansville (97,062); Hammond (70,184); Terre Haute (62,693); East Chicago (54,637); Muncie (49,720); Anderson (41,572).

History.—The biennial general assembly was not in session during 1942. Members of the 1943 assembly elected in Nov. 1942, included 82 Republicans and 10 Democrats for the house of representatives, 23 Republicans and 5 Democrats for the state senate. Counting the 22 holdover members, the new senate was to have 38 Republicans and 12 Democrats. Compared with the 1941 general assembly, this represented an increase of 18 Republicans in the house and 7 in the senate. Republicans were re-elected to the offices of secretary of state, auditor, treasurer and superintendent of public instruction. Officers elected were: Rue Alexander, secretary of state; Richard T. James, auditor; James M. Givens, treasurer; and C. T. Malan, superintendent of public instruction. In addition, the Republicans gained th office of attorney general, one seat on the supreme court, an four on the appellate court. The governor, Henry F. Schrick (Dem.), and lieutenant governor, Charles M. Dawson (Rep. were elected in 1940 for four-year terms. The supreme court f 1943 was to include 3 Democrats and 2 Republicans, with th appellate court entirely Republican. For congress, Indiana electe 9 Republicans and 2 Democrats as against 8 Republicans an 4 Democrats in the 77th congress. The state lost one represent tive under the apportionment law based on the 1940 census.

Education.—In the school year 1941–42 there were 2,79 elementary schools and 866 high schools. The enrolment elementary grades (1–8) was 461,968; in secondary school grad (9–12), 192,147; in kindergarten, post graduate and speci classes, 15,033; making a total enrolment of 669,148. The were 11,608 teachers in elementary grades, 1,104 in junior hig schools and 7,948 in senior high schools.

Public Welfare, Charities, Correction.—During 1942 th state maintained eight institutions for mental cases: Centr State hospital (Indianapolis), Evansville, Logansport, Richmon and Madison State hospitals, Muscatatuck and Fort Wayne Sta schools, the Village for Epileptics (New Castle); nine home hospitals, and schools: Soldiers' home (Lafayette), Soldiers' an Sailors' Children's home (Knightstown), State Tuberculos sanatorium (Rockville), Southern Indiana Tuberculosis hospit (New Albany), three Indiana University hospitals (Indianapolis School for Blind (Indianapolis), School for Deaf (Indianapolis and six correctional institutions (including two training schools

Payments for public welfare were as follows for the year endi June 30, 1942: old-age assistance, $15,797,936.82; aid to d pendent children, $5,606,604.79; blind assistance, $602,686.6 general relief, $40,398,641.57; unemployment compensatio $10,590,036.42.

The number of inmates in Indiana's four correctional instit tions on June 30, 1942, was 5,263; in its two training schools, 67 Expenditures for the six institutions for the year were $2,144 031.77.

Communications.—There were on June 30, 1942, approx mately 10,210 mi. of roads in the state highway system an 70,610 mi. of county roads. Expenditures by the state highwa commission during the fiscal year ending June 30, 1942, totalle $25,603,016.01. The mileage of steam railroads operated Indiana in 1941 (exclusive of switching lines) was 6,928. April 1942, there were 47 airports recognized by the U.S. d partment of commerce.

The Indiana Bell Telephone company on Dec. 30, 1942, r ported 313,513 telephones in use in the state. Independent co panies reported 251,281 telephones in use on June 30, 1942.

Banking and Finance.—On June 30, 1942, there were 3 state and 121 national banks in operation in Indiana. The tot capital of state banks was $60,750,000; deposits amounted $576,008,000. The national banks had a total capital of $58 191,282 and deposits of $707,608,855.

The 184 state-chartered building and loan associations ha assets of $92,095,210.92 at the close of the year 1941; th

Apples, bu.	1,392,000	2,230,000

Table II.—*Principal Industries of Indiana, 1939 and 1937*

Industry	Value of products	
	1939	1937
teel works and rolling mills	$301,268,709	$356,646,436
lotor vehicles, motor vehicle bodies, parts and accessories	252,684,069	319,853,900
etroleum refining	182,566,697	190,332,763
leat packing, wholesale	80,292,977	79,885,003
efrigerators, etc.	54,675,833	58,013,662
ven coke and coke-oven by-products	43,559,216	43,249,409
rugs and medicines	37,400,313	36,022,938
ousehold furniture, except upholstered	32,454,225	57,094,049
anned and dried fruits and vegetables	26,521,364	45,006,000

leral savings and loan associations had assets of $105,321,000. Total receipts of the state treasury during the year July 1, 41 to June 30, 1942, were $170,253,882.72; disbursements alled $160,702,090.93. The state, as such, had no debt, the nstitution forbidding the incurring of indebtedness except for tain strictly limited emergencies.

Agriculture.—The total value of agricultural production in 40 was $276,642,600; the total acreage harvested was 10,047,- 0. Cash income from crops was $74,518,000, from livestock l livestock products, $202,124,000; from government payments, 2,657,000.

Manufacturing.—The biennial federal census for 1939 showed 7,467 wage earners (average for the year), $345,475,000 paid wages, and $2,227,648,011 as the value of the products.

Mineral Production.—In 1941 there were 260 new oil wells l 57 gas wells completed. (C. B. C.)

dians, American.

The record shows that the American Indians contributed a larger propor- n of their total number to the armed services than any other ial group in the United States. No discrimination with respect Indians was practised by any branches of the services and ny Indians have already won commissions in the army and rine corps. The marine corps and some army units organized lian groups for specialized service. In World War I, many In- ns were disbarred by illiteracy and most were not subject to draft because they were not citizens. This discrimination was noved in 1924 in recognition of the splendid service of those o enlisted. Indian high schools were stripped of boys above who were either in the army or in war industries. Girls were ng trained as welders and machinists, and were welcomed in aircraft and other industries. On reservation after reservation, number of Indians in the armed forces or industry jeopardized rmal agriculture and livestock activities. The production of ive arts and crafts gave way to war industry.

Aleut Removal.—Approximately 160 Aleuts and two federal ployees, an Indian service teacher and a reporter for the ather bureau, occupied the island of Attu at the time of the panese invasion. It was assumed that all were captives of the panese. Following the simultaneous bombing of the naval base Dutch Harbor and the neighbouring native villages of Una- ka, all Aleuts on the outlying islands and the Eskimos on the ibilofs were evacuated to southeast Alaska and re-established in ning villages and abandoned CCC camps where self-supporting ivities were being provided.

Indian Office.—The administrative staff of the Office of Indian airs was moved in Aug. 1942 from Washington, D.C. to Chi- go. Hundreds of Indian service employees entered the armed ces or transferred to war agencies. The service was operating h a reduced staff both in Chicago and in the field.

AN AMERICAN INDIAN BONNET was presented in Feb. 1942 to Soviet Premier Joseph Stalin by the Indian Confederation of America for his achievement in stopping the German invaders of Russia. Mohawk Chief Fallen Trees presented the bonnet to Edward C. Carter, president of Russian War Relief, Inc.

Aboriginal Occupancy.—The supreme court decision in the alapai land case was held by the solicitor of the department of the interior to apply to native resources in Alaska. This might enable the Indians of southeast Alaska to re-establish rights to some fishing sites pre-empted by whites.

CCC-ID Terminated.—With the termination of the Civilian Conservation corps, as of July 1, 1942, the Indian division also brought its work to a close. No single federal agency in the previous 15 years contributed more effectively to the training of Indians in the use of tools and machinery through the application of skills to actual construction than the CCC.

Japanese Relocation on Reservations.—*See* ALIENS.

Inter-American Indian Institute.—Commissioner John Collier of the Indian service served as chairman of the governing board of the Inter-American Indian institute established in 1941. Representatives of the Indian service were loaned to Haiti and to Saudi Arabia to advise in education and irrigation matters. Other advisory services within the Americas were increased.

Industrial Health.

Of the many thousands of men and women employed in war industry, women employees are absent oftener than men, and individual absences tend to be of longer duration. Medical data were being collected to supply dependable information on the effects of occupation upon the health of the unmarried or childless woman, the pregnant, or the mother with associated home and family responsibilities. Industry also turned to older men and women as a source of labour supply, and they, in turn, presented a host of medical problems to physicians, under the general designation of preventive geriatrics. Moreover, the physically handicapped were in the unusual position of being sought out as recruits for a wide variety of employments. Younger male workers, rejected for military service because of physical reasons, for the most part, were found acceptable, in many ways, to industry. Because of their substandard physical status, however, an organized program of medical or surgical "rehabilitation" was being set up in certain localities to put this group of workers in better physical condition for employment.

Personnel Problems.—The war also affected industrial health activity through considerable reductions in available qualified personnel—physicians, nurses, engineers, chemists and technicians, all of whom were equally useful to the armed forces. A number of methods were devised to recruit additional people through provision of intensive teaching courses. Because of limited personnel, there was some thought given to training technical assistants below professional grade to conduct routine functions.

Industrial Toxicology.—Research continued into hundreds of problems in hygiene and toxicology created by the accelerated war production program. New materials and processes had to be introduced without clear knowledge of possible harmful effects. Scarcity of certain harmless products necessitated reversion to the use of harmful substances. Particular attention was paid to materials used in the synthesis of rubber and in the manufacture of munitions.

The work of Foulger and Fleming, in the early detection of industrial intoxication through accurate observations of the blood pressure, aroused considerable interest.

Industrial Medicine and Surgery.—Safety experts were greatly concerned over the upswing in the incidence of occupational accidents which were excessive in some localities and in certain industries. This serious turn of events necessitated a presidential proclamation urging industry, workers and safety organizations to redouble efforts at reduction of lost time accidents. Occupational disease was similarly on the increase, in keeping with the increased man-hours of exposure. Dermatitis still accounted for the largest number of disabilities. As in former years, the greatest single cause of lost time in industry continued to be infections of the upper respiratory system. In respect to all causes of lost time, prevention was increasingly recognized as the cardinal principle of sound industrial health service.

Advances were made in correlating physical and mental ability with specific job requirements. The U.S. Civil Service commission particularly interested itself in this direction.

Communicable disease is a constantly recurring problem in industry, and considerable activity in the direction of case-finding and prevention occurred during 1942. A plan for the control and active treatment of syphilis in the industrial population was published as an aid to state and local health authorities. New developments in radiologic equipment facilitated case-finding of pulmonary tuberculosis in industry.

Interest in the whole subject of physical and vocational rehabilitation following disability of all kinds was greatly intensified through actions in legislatures, governmental agencies and professional groups. A rehabilitation council was organized, containing representation from all major related agencies in the country.

The most successful plans for health education in industrial plants were related to nutrition, under the stimulus of national and state organizations. In the same way, but to a much more limited degree, problems of housing, proper rest, recreation and suitable use of leisure time were receiving attention. Industrial Production: *see* BUSINESS REVIEW; WAR PRODUCTION, U.S.

Infantile Paralysis.

In spite of the difficulties imposed by a global war the National Foundation for Infantile Paralysis in 1942 was able to expand its program of rendering assistance to scientific workers to study various phases of this disease.

The Virus.—By means of ultracentrifugation and chemical treatment the virus was obtained in more concentrated and purified form. Dr. E. Racker reported obtaining from poliomyelitis-infected brains and cords of mice a crystalline substance that was either the virus or a crystalline substance onto which the virus had been adsorbed.

Means of Spread.—Additional evidence was secured that virus was exceedingly widespread in nature and highly resistan many chemical and physical agents that were bactericidal bacteriostatic. Epidemiological studies by both Dr. Tho Francis, Jr., and Dr. George Y. McClure and their associ forcefully pointed out the relatively important role of the mi case or carrier. Dr. Alexander Langmuir reported that in small rural outbreak of all apparently well contacts, 84.5% the children and 50% of the adults excreted virus in their st following exposure. Francis reported on the clinical and clinical infections resulting from the travels of one infe family.

Many workers showed that in the laboratory, by using var species of monkeys, clinical infection could be produced by p tically any method that allowed introduction of the virus the body.

Pathology.—Important information relative to the part the nervous system in mild clinical and subclinical infection gained. McClure described lesions in the posterior root gan Dr. Harold K. Faber reported on involvement of the Gasse ganglion in animals infected by the oral route. The prev work of Dr. Albert B. Sabin to the effect that many parts of body were invaded was supported by further studies. Drs. H ard A. Howe and David Bodian published an outstanding re of the several years' work under the title *Neural Mechanism Poliomyelitis.*

Immunity.—All attempts at production of induced immu or increased resistance, either by use of biological or chem products, met with flat failure. In fact, there was additional dence to show that there was little acquired general or hum immunity, but such resistance as did develop was cellular

SISTER KENNY, Australian inventor of the famed exercise treatment for i tile paralysis, went to the U.S. in 1942 to teach her method to U.S. do and nurses. Here she is shown at a demonstration in Little Rock, Ark., rot a victim's foot to re-establish muscular activity pended upon direct virus invasion of the neuraxons and nerve lls.

Prevention.—Lacking any means of active immunity and any actical method of ridding the environment of viable virus ma- ial, protection still was dependent on avoidance of unnecessary posure during epidemic times. Repeatedly public health officers d epidemiologists stressed the importance of avoidance of nic during outbreaks. With improvement in treatment facilities need for early medical care took on added significance and portance.

Diagnosis.—No clear-cut set of diagnostic standards was veloped, nor were any specific laboratory tests developed. Di- nosis still depended on the array of clinical signs and symp- ns plus the use of some laboratory work to rule out certain ner neurotropic virus diseases. The need for such tests was de even more apparent by the more widespread recognition of se other neurotropic virus diseases.

Treatment.—None of many drugs tested was found to be of value in the treatment of infantile paralysis. Systematic ting programs were maintained by the National Foundation Infantile Paralysis in several well-equipped laboratories.

The Kenny method of treatment by hot moist packs and early ysical therapy gained widespread recognition during the year. ysicians, nurses and physiotherapy technicians were widely in- ucted in this method. Not only was there common adoption this method of treatment, but there was also common ac- tance of the teaching of Sister Kenny that the cardinal symp- ns were those of "spasm" and temporary dysfunction simulat- paralysis. It was more widely recognized that true permanent cid paralysis resulting from extensive destruction of anterior n cells was a relatively rare state in clinical poliomyelitis.

Dr. R. Plato Schwartz and Dr. Harry D. Bouman of Rochester, Y., reported a series of electromyographic studies in early iomyelitis. They reported that spasm, as indicated by in- ased action current potentials, did exist, not only in involved paralyzed muscles, but also in their opponents and even in er muscles without clinical evidence of disturbance. They also wed that this condition persisted for long periods and that it s adversely affected by stretching. Such spasm tended to appear or to lessen when treated by hot foments according to method advocated by Sister Kenny.

While statistical evidence supporting the claims of the Kenny thod was not produced, many experienced clinicians reported ir opinions supporting the original report of Cole, Pohl and app. (*See* also Nervous System.)

fant Mortality.

The generally favourable health conditions in the United States and England d Wales during 1942 were reflected in their low infant mor- ity for that year. Provisional reports for the United States for the first eight months of 1942 showed 4.9% fewer deaths in the first year of life than in the corresponding period of 1941. During all of 1941, there were recorded 113,675 infant deaths, with an infant mortality rate of 45.3 per 1,000 live births, the lowest yet on record for the United States. In England and Wales, the great towns experienced a decrease of 5.4% in infant deaths from 1941 to 1942, the period of comparison being the first eight months of each year. For the whole of England and Wales, 34,292 infant deaths were reported during 1941 with a rate of 58.4 per 1,000 live births. Infant deaths in the whole of Canada in 1941 numbered 15,197, the infant mortality rate being 60 per 1,000 live births.

The European population of New Zealand had a rate of 30 per 1,000 in 1941; for Eire, the rate was 73 per 1,000. Germany reported 62 infant deaths per 1,000 live births for 1941; Belgium 85; Bulgaria 123; Hungary 117; Netherlands 43; Portugal 151; Switzerland 41. In the same year, 1941, the infant mortality rates per 1,000 live births for several Latin American countries were as follows: Argentina 82; Chile 200; Ecuador 139; Salvador 105 and Venezuela 121.

Within the United States, Utah had an infant mortality rate of only 29.5 per 1,000 live births in 1941. Eight states had rates between 30 and 35, namely, Connecticut, Idaho, Illinois, Minnesota, Nebraska, New York, Oregon and Wisconsin. Twelve states had rates of more than 55 per 1,000: Alabama, Arizona, Georgia, Kentucky, Louisiana, New Mexico, North Carolina, South Carolina, Tennessee, Texas, Virginia and West Virginia. All of these states are in the southern tier of the country and, except for Arizona and New Mexico, owe their high rates principally to the large proportions of Negroes in them, who have a high infant mortality. The two states excepted have large Mexican populations, also with high infant mortality. (See appended table.)

Among the cities of 100,000 population or more in 1940 very low infant mortality rates were found for the following, after births and deaths were allocated according to the residence of the mother: Portland, Ore. 25.6, St. Paul 26.2, Chicago 28.4, Springfield, Mass. 29.1 and Minneapolis 29.6. For other large cities, the rates were: New York City 35.2, Philadelphia 41.3, Detroit 37.5 and Los Angeles 34.3.

In 1940, the latest year of complete record, the white population of the United States as a whole had an infant mortality rate of 43.2 per 1,000 live births, while the Negroes had a rate of 72.9 and other races a rate of 91.0

Of a total of 110,984 deaths in the first year of life during 1940, premature birth accounted for 32,346, pneumonia (all

Deaths Under One Year of Age per 1,000 Live Births, United States, 1941

State	Infant Mortality Rate	State	Infant Mortality Rate
United States	45·3	Montana	36·9
		Nebraska	34·4
Alabama	60·0	Nevada	42·2

forms) for 14,881, congenital malformations for 11,038, injury at birth for 10,506, diarrhoea and enteritis for 8,222, congenital debility for 2,827, influenza for 2,696 and whooping cough for 2,015. Altogether, these eight causes accounted for three-quarters of the deaths.

Within the first day of life alone, there were 32,870 deaths out of the total of 110,984 within the first year of life. Almost two-thirds, or 67,866 of this total died within the first month of life. Investigations showed that a large number of deaths in infancy could be avoided by an adequate program of prenatal and neonatal care in which correct diet plays a large part.

Ingersoll, Royal Eason

(1883–), U.S. naval officer, was born June 20 in Washington, D.C., the son of Rear Adm. Royal Rodney Ingersoll. He was appointed to the Naval academy from Indiana, 1901, and after graduation was assigned to several U.S. warships. He was on duty at the Naval academy, 1911–13, when he received orders to join the Asiatic fleet. He went to the office of naval operations in 1916, and during World War I received the navy cross for his services in organizing, developing and directing the communications office of the navy department. Pres. Roosevelt in 1938 nominated him rear admiral, jumping him over the heads of a dozen senior officers. On Dec. 20, 1941, Secretary of Navy Knox appointed him commander of the Atlantic fleet to succeed Adm. Ernest J. King, who was designated commander in chief of the U.S. fleet. Ingersoll's appointment followed a shake-up in army, navy and air commands after Secretary Knox toured Hawaii and found U.S. defense forces there "were not on the alert" during the Japanese attack on Pearl Harbor Dec. 7, 1941. On July 3, 1942 Pres. Roosevelt named Ingersoll for promotion to full admiral.

Initiative and Referendum.

This most ambitious of all experiments in pure democracy was employed during 1942 despite the absorption of public interest in the war, in about three-fourths of the states (mostly on Nov. 3) as well as by the national government. For important state referenda of 1942, *see* the articles on the states concerned.

Among U.S. federal referenda of 1942 was one held May 2, in which those wheat growers who had already accepted the AAA acreage limit approved restricted marketing quotas (323,003 to 69,081). On Dec. 12, cotton growers in 19 southern and southwestern states voted by a majority of more than two-thirds to continue federal control of production and marketing of their staple in 1943. Indian tribal constitutions, under federal auspices, were voted on March 15 by the Moapa band of Paiutes (Nev.) and on Aug. 31 by the St. Croix Chippewa (Wis.); amendments on Feb. 2 by the Ft. Bidwell Indian community (Cal.) and on Feb. 4 by the Cheyenne and Arapahoe tribes (Okla.); charters on Jan. 5 by the Tanacross Indians (Alaska); on Feb. 15 by the Upper Lake band of Pomos (Cal.) and on May 3 by the Moapa band of Paiutes (Nev.).

Canada voted (2,945,514 to 1,643,006) in 1942 to authorize the draft for overseas service; it was not actually required until se months later.

On the subject of liquor control, Arkansas adopted (52,83 41,040) but North Dakota rejected (85,733 to 84,049) initia measures to prohibit the liquor traffic in certain areas.

As to old age assistance, Idaho adopted (75,000 to 35,344) Washington rejected (225,027 to 160,084) proposals embody the "Townsend Plan," with minimum monthly grants to "e bles" of $40 and additional benefits.

Taxes on motor vehicles and fuel were reserved for high purposes by constitutional amendments in Iowa (433,917 to 472), Oregon (125,990 to 86,332) and West Virginia (228,82 38,651). (C. S. L.; X

Inland Waterways: *see* Canals and Inland Waterways.

Inman, Ondess Lamar

(1890–1942), U.S. biologist botanist, was born Novembe in Bloomfield, Ind. He was professor at Antioch college in C from 1921 until his death, and in 1930 he was named directo the Charles F. Kettering foundation for the study of chlorop and photosynthesis at Antioch. Dr. Inman, whose major objec was to establish the relationship of sunlight to plant growth, covered that the chlorophyll extracted from plants and stu under laboratory microscopes differed from the substance as it isted in living plants. In 1937, he announced that chloroph hitherto believed to be the controlling factor in plant growth, peared to be only part of the process. He died in New York c July 21.

Insurance.

Accident and Health.—With an estimated of 12% in 1942, total accident and health hospitalization insurance premiums exceeded $350,000,000. Gr and hospitalization showed exceptionally large increases. It estimated that there were 30,000,000 individual policies iss covering 25,000,000 individuals at the end of 1942. The sal nonoccupational coverage to war workers covered on the job workmen's compensation was stimulated. A reinsurance pool formed to provide insurance for civilians covering personal in or death arising out of war action, such as enemy bombing, i sion, etc. Companies tended to liberalize the attitude in reg to war clauses, and some continued coverage on men in the ar services within the U.S. Provisions were made for reinstatem of noncancellable policies after the return of men in servic civilian life.

A survey conducted of claim complaints received by 11 re sentative state insurance departments indicated that there only 12 complaints out of each 10,000 claims paid. As of 1 about one out of every five policyholders had a claim paid e year. (C. D. Sp

Great Britain.—Accident insurance results published du 1942 showed a recovery in the volume of the business, almost storing it to prewar levels. The only exception was in the m section, which continued to shrink following the further rest tions imposed during the year on the use of private cars. consequent reduction in road traffic made it possible for the m insurance offices to allow a 20% rebate on private car premiu which took effect July 1, 1942.

Workmen's compensation business showed the greatest ex sion owing to industrial activity arising out of the war and reased wage rolls connected therewith. Premium rates remained altered, but the additional charge levied to provide for the tra liability imposed by the Workmen's Compensation (Sup- mentary Allowances) act was discontinued in March. In view the expansion of normal premiums, rates were in future to be justed to a 70% claim ratio instead of 65% as previously. (C. E. G.)

Automobile.—The automobile insurance industry was vitally ected by U.S. entry into World War II. The most marked ect was on automobile casualty loss ratios. Because of volun- y and governmental restrictions on driving, the accident rate pped sharply, and the companies showed a substantial under- iting profit in spite of drastic rate reductions.

The war also produced a substantial drop in volume. With no w automobile production, curtailment of use, and lower pre- ums per unit, automobile volume figures began to fall during 42.

By keying automobile rates to the type of rationing card held the insured, the industry in 1942 was operating on a rate basis ectly related to the mileage operated.

The most interesting aspect of the business from the stand- nt of legislation in 1942 was the results of the New York ancial Responsibility law which went into effect in 1941. Its ef effect was to double the percentage of the total number of s insured. (G. E. Ho.)

Fire.—The business of fire insurance, so far as receipts and ses are concerned, had a fairly successful year in 1942. There s no outstanding fire in which property loss was exceptionally vy, such as the Fall River fire of 1941. There were, however, eral fires where the loss of life was serious, notably the case the Boston night club fire, in which the loss of life was about .

Perhaps the outstanding event in fire insurance in 1942 was formation of the War Damage corporation (*see* below). This poration, a government project, was organized to take care of perty losses originating from the war. If the cause was direct my action, no question could arise about the liability of the poration, but there were bound to be "borderline" cases. For tance, if a bomber were being tested before acceptance by the vernment and property was injured, was the loss to be paid by War Damage corporation? Private insurers would carry such isk only to a limited, if any, extent. This was a form of in- ance on which statistics were very scant in 1942; it was ap- ed only to a limited extent in the United States during World ir I. Great Britain, however, had on its statute books the law t over from World War I, and so was able to put it into ef- t immediately at the start of World War II. War damage to perty, even in Great Britain, amounted to only about 2% of total property value in 1939–42.

Use and occupancy insurance, protecting the individual against ses from the time his plant is damaged until it is restored, sed difficult problems in 1942. Under normal conditions this urance could be successfully written, but, in 1942, the impos- ility of securing either building material or raw materials for ure operations brought about a different situation. Many npanies considered the advisability of discontinuing or curtail- this type of insurance. (*See* also Fires and Fire Losses.)

(E. R. H.)

Hospitalization.— The most important 1942 developments re the continued growth of nonprofit, community-sponsored vice plans approved by the American Hospital association, and affiliation of several plans with newly organized nonprofit med- l service plans. Seventy-six approved plans, many of them ng the name "Blue Cross," were operating at the close of 42 with a combined membership of 11,000,000 persons, and 11 of these had working arrangements with nonprofit medical plans. The 76 plans served 34 states and 3 Canadian provinces.

During 1942 nonprofit plans paid more than $50,000,000 for the hospital care of 1,000,000 subscribers, rendered in 2,500 member hospitals.

Of much significance was the adoption by the American Hospital association of the "Bishop Resolution" opposing the inclusion of indemnity for hospital expense in the Federal Social Security program, as had been proposed, and setting forth a program for the extension of nonprofit plans to reach persons in occupational classifications and at income levels not generally covered by Blue Cross plans. (A. G. S.)

Life.—About $2,500,000,000, or approximately 90% of the net new investments of every kind made in 1942 by legal reserve life insurance companies was used to purchase United States and Canadian government bonds. The payments made by individuals to purchase and maintain life insurance are generally recognized as a definitely anti-inflationary force, in helping both to protect the national credit and to divert income away from commodity channels. Of fundamental importance, too, is the protection provided for the people of their two countries by the life insurance companies of the United States and Canada, supplemented as it is by the protection furnished through the United States government for dependents under the Social Security act and for members of the armed services under National Service Life Insurance, and in Canada by alternative methods. At the end of 1942 the total life insurance (excluding reinsurance) in force in the legal reserve companies of the United States and Canada was estimated at more than $135,000,000,000 or a gain of 4% over 1941. The new business issued during the year amounted to about $13,000,000,000. The assets of the companies at the end of 1942 amounted to approximately $37,500,000,000, after paying or crediting to policyholders and beneficiaries about $2,600,000,000 during 1942.

The mortality experienced in the United States and Canada during 1942 continued favourable. The continued decline in the mortality from pneumonia represented one of the triumphs of modern medicine. The downward trend of the tuberculosis death rate was also maintained. While there was a drop in motor vehicle fatalities, attributed primarily to the general reduction in the civilian use of automobiles, the increased industrial activity in connection with the war production program resulted in a greater number of fatalities caused by occupational accidents. War deaths during 1942 comprised about 1½% of total deaths among ordinary policyholders, and a considerably smaller proportion among industrial policyholders.

The interest rate earned during 1942 on the aggregate of life insurance companies' assets continued at the low level characteristic of previous years, reflecting to a marked degree the low yield obtainable on government bonds. Because of the continued low rates, a number of companies had revised the interest bases for premium rates and reserves for new life insurance. Some of them at the same time began using the American Men Ultimate table of mortality in place of the older American Experience table, for the valuation of new ordinary insurance. Because the effect of low interest rates greatly overshadows the improvement in mortality, the premium rates based on more modern mortality tables and lower interest rates were generally higher than those previously in effect. While the changes in premium rates charged did not, of course, affect policies issued in the past, the low level of interest rates responsible for such changes was also reflected in decreased dividends on participating policies.

Life insurance companies in the United States were required to bear their share of the increased tax under a modified formula for income taxes incorporated in the federal Revenue act of

1942. This formula retained investment income as a tax base and also the principle of allowing life insurance companies some adjustment for the interest required to maintain their reserves.

The war was directly responsible for the incorporation in policies of war risk provisions limiting the insurance company's liability in event of death during military service of the insured. Prior to the entry of the United States into World War II, only a very small proportion of life insurance policies in force on citizens of the United States contained or retained any limitation of the life insurance benefits on account of war service or required the payment of extra premiums in such event. The companies, therefore, were absorbing the war risk on practically all policyholders whose policies were issued prior to the entry of the country into the war, but, in the interest of these older policyholders, precautionary measures had to be taken in respect to new insurance. The extra hazard on the lives of members of the armed forces was properly assumed for a limited amount by the federal government through National Service Life Insurance. (L. A. L.)

Marine.—The year 1942 will be remembered by U.S. marine underwriters as a disastrous one, largely because of the results of war risk insurance on both hulls and cargoes. It was an extremely busy year, what with the constantly changing conditions and the necessity for arranging new forms of cover to protect shippers whose goods had to be carried under wartime conditions of transit. The most important of these new forms probably was the wartime extension clause added to cargo policies, by which goods are covered for unlimited periods at a port of transshipment provided the goods remain the property of the original owners. The "missing vessel agreement" entered into by all companies and the War Shipping administration was of great benefit to shippers who had placed their marine insurance and war risk in different markets. Some ships were lost without trace, and the cause was not known; in other cases the circumstances of the loss were known, but it was uncertain as a matter of law whether it should be settled as a marine loss or a war loss. In all such cases under the "missing vessel agreement" and a supplemental agreement among the same parties, the assureds were paid promptly.

Surcharges were the subject of careful consideration in 1942. Conditions in all ports throughout the world were bad; in many places the docks and warehouses were filled with merchandise either awaiting shipment or recently landed and not yet removed. Heavy claims were made for theft, pilferage and nondelivery, particularly from areas subject to bombing.

Early in 1942 there was considerable confusion in shipping circles. Ships requisitioned by the U.S. were sent to ports where the masters and officers had never been before. Quantities of merchandise at Pacific coast ports, some on the docks and some already loaded on ships, were taken by the government and the ships were sent out to destinations unknown to the owners. Ships were operated in convoys and had to enter and leave darkened ports without the customary aids to navigation. Heavy claims on both hulls and cargoes resulted during the early part of the year. But after the entire operation of the merchant marine was put under control of the War Shipping administration, shipping operations gradually were placed on a more orderly basis. However, the claims for shortages and nondelivery of cargo continued at the end of 1942, particularly in the near east and South America.

War Risk Insurance.—The U.S. government played an important part during 1942 in war risk insurance—through the War Damage corporation covering property on shore, and through the insurance department of the War Shipping administration covering ships and waterborne cargoes. The underwriting
powers of the War Shipping administration had been defin
by legislation passed some years earlier when congress w
dominated by noninterventionist sentiment. For example:
a vessel was carrying any contraband, the War Shipping admin
tration could not insure either the hull or any part of the car
In view of the fact that almost everything useful in the cond
of war is regarded as contraband, it was apparent that th
limitations effectively prevented the War Shipping administ
tion from supplying U.S. marine insurance needs. A relativ
small percentage had been written by the American Mar
Insurance syndicate, the rest principally in the London mark
Soon after the attack on Pearl Harbor, however, the War Sh
ping administration indicated a desire that the war risk
surance on all U.S. ships, and all U.S.-owned ships under ot
flags, be written in the United States. The underwriters in t
market were reluctant to accept these large increases in th
lines; but, realizing that the War Shipping administration its
could not legally write the insurance, they felt that they sho
comply with the wishes of the administration as a matter
public duty. Shortly thereafter the War Shipping administrat
again approached the syndicate and requested that they aband
their method of fixing war risk rates from day to day, depe
ing on conditions, and promulgate a rate schedule that wo
be good for a month, and under which the syndicate wo
name rates for 60-day voyages on the Atlantic coast and
West Indies trade. It was pointed out to the syndicate that s
a schedule was essential to enable the administration to
freight rates based on operating costs, in which war risk ins
ance was naturally an important element. The syndicate h
tated to make such a radical change in its method of fix
premiums; but, toward the end of January, it finally submit
a rate schedule good for acceptance any time in Februa
These events occurred on the eve of the great German s
marine attack on U.S. coastal shipping. The result was that
syndicate sustained enormous losses. Under normal conditi
these losses could have been recouped by increases in
after the expiration of the 30-day period above mentioned;
at about this time the underwriting powers of the War Shipp
administration were broadened, the restrictions with respect
contraband were eliminated, and the administration procee
to assume the war risks on U.S. vessels on terms which
little, if any, relation to the risks involved. The syndicate clo
the year with a net loss running into many millions of doll
Hull war risks were assumed entirely by the War Shipping
ministration, and the syndicate was no longer writing this c
of business at the end of 1942.

The situation with respect to cargo insurance developed al
somewhat different lines. The American Cargo War Risk
insurance Exchange, which covered, by way of reinsurance,
great bulk of U.S. cargoes, had no agreement with the
Shipping administration and was, therefore, able to adva
rates from day to day as the submarine menace grew m
serious. Unfortunately, however, the sinkings increased
rapidly that the increase in premium was always a few we
behind the increase in losses. Furthermore, the Office of P
Administration insisted that war risk premiums on imports sh
not be increased because this would involve an increase in
price of sugar, coffee, cocoa and other products on which cei
prices had previously been established. The War Shipping
ministration was thus forced to quote rates which had no
tion whatever to the risks involved, and which were in
merely nominal. This action naturally created an enorm
demand for government insurance. During the first half of
the rules of the administration required that each risk be se
rately submitted—a cumbersome and unsatisfactory method

Later a plan was worked out through the American Institute Marine Underwriters whereby all companies writing marine surance in the United States could be appointed underwriting ents for the War Shipping administration to issue open policies vering war risk insurance on imports to the United States.

After July 1942 the United States armed forces were able to ake greater headway against the submarine menace, and losses creased materially. Nevertheless, the results for the year owed a loss of millions of dollars sustained in writing war k insurance on cargo; and because the share of this business itten by the War Shipping administration was constantly creasing, the prospect of recouping these losses was not good.

The Inland Marine Underwriters' part in war risk insurance s small in 1942, but nevertheless important. In accordance th world-wide practice, both hull and cargo war risk insurance ith certain minor exceptions) covered only while waterborne. ortly after Pearl Harbor the U.S. government announced it uld make good any damage in United States territory caused enemy action. A government-owned corporation, the War mage corporation, was finally created to issue policies cover- against such damage (see *War Damage*, below).

(S. D. McC.)

War Damage.—War Damage corporation was created as a poration by Reconstruction Finance corporation on Dec. 13, 41, with a capital of $100,000,000 for the purpose of providing urance protection against damage to U.S. property resulting m enemy attack. By public announcement, the corporation mediately extended to owners of property in the United tes, Alaska, Hawaii, the Philippine Islands, Puerto Rico and Virgin Islands assurance of reasonable current protection, nding future arrangements for coverage under policies of urance.

By act of congress approved March 27, 1942, Reconstruction nance corporation was authorized to supply War Damage poration with funds in an aggregate amount not exceeding 000,000,000, for the purpose of providing through insurance sonable protection against loss of or damage to property ulting from enemy attack or from the action of the military, val or air forces of the United States in resisting enemy attack. r Damage corporation placed its program of policy insurance operation, effective July 1, 1942, and the free protection retofore effective was terminated on the same date.

To avoid the necessity of creating a complete governmental anization to handle the program, the corporation entered into arate agreements with 546 fire insurance companies pursuant which such companies agreed to act as "fiduciary agents" the corporation in receiving applications and premiums, ing policies and otherwise handling the program. The corpo- ion in 1942 operated through approximately 1,450 established icy-issuing offices. The insurance agent or broker who sub- ted the application received a service fee of 5% of the mium, with a minimum of $1.00 per policy and a maximum $1,000 per policy. The insurance company through which the lication was submitted received an expense reimbursement 3½% of the premium, with a minimum of 50 cents per policy a maximum of $700 per policy, subject to adjustment on basis of actual costs and expenses. The insurance industry, resented by the 546 participating companies, had a 10% erest in the operating profits or losses of the program in 1942, ject to a limit of $20,000,000. As of Oct. 31, 1942, premiums lected aggregated approximately $119,900,000 and it was mated that approximately $94,000,000,000 of War Damage poration insurance was in force on that date. In excess of 50,000 policies had been issued by the corporation. Premium es were uniform throughout the territories covered, and varied with types of property, classes of occupancy, and types of construction. The insurance was not compulsory.

Effective Dec. 21, 1942, the corporation made available insurance on money and securities through the facilities of 88 casualty and surety insurance companies likewise acting as "fiduciary agents" of War Damage corporation.

The corporation established its principal office in Washington, D.C., and was managed by a board of directors appointed by Reconstruction Finance corporation. (W. L. C.)

Great Britain.—The principal forms of insurance in Great Britain against war damage on land became well established during 1942. The number of policies issued up to Dec. 31, 1941 were: under the commodity scheme 4,160,800; under the business scheme 1,533,600; and under the private chattels scheme 934,900. The first two schemes were compulsory on all but small traders. The rates of premium payable were revised from time to time. Under the commodity scheme the rate in 1941 was 7*s.* 6*d.* per cent per month, and this was reduced to 5*s.* per cent per month as from June 3, 1942. The rate for the business scheme was made at 10*s.* per cent for the six months commencing Oct. 1, 1942, with an indication that it would not exceed a further 10*s.* per cent for the next six months thereafter. The rate for the previous 12 months was 20*s.* per cent. The private chattels scheme remained at 20*s.* per cent per annum with higher rates for large amounts. Buildings were covered under a contribution levied through the inland revenue which was to continue for five years from 1941. The risk period, which originally ran up to Aug. 31, 1941, was later extended. (*See* also LAW; VETERANS ADMINISTRATION.) (C. E. G.)

Interior Decoration.

The early part of 1942 showed an increasing interest in contemporary design, but owing to government building restrictions on residential work very little new work was developed, with the result that interior architectural design did not change over 1941.

There were various new and interesting designs created for interior furnishings which were developed to overcome priorities, such as all-wood pieces of furniture, but they were not made in any large quantities owing to the difficulty in obtaining raw materials such as plywood, etc.

The theme or keynote of the interior decorating field in 1942 was based on the current trend to "stay at home and like it," as this phrase sprang from necessity due to conditions of the time. People were made more decoration-conscious and were urged to make their homes attractive to help keep up morale. Furnishings were carried out in simple but livable lines and created an effect of restfulness and simplicity rather than the more elaborate feeling of past years.

Furniture.—Mahogany and natural wood finishes were the most popular. There was a new development of all-wood pieces, including wooden springs, and furniture that could be folded or dismantled for easy and quick transportation. Increasing popularity was evident of so called utility pieces, such as chests, cabinets, bookcases, etc. that could be used interchangeably. Traditional furniture was still used to a great extent though contemporary design was gaining in favour due to continued improvement of this style.

Furniture Coverings.—Cotton and cotton and rayon mixtures in interesting, textured weaves predominated. Silk and wool were still used, though nylon began to take the place of silk and cotton to replace wool, as these two fibres were noticeably curtailed for civilian use. Printed linen, cotton and chintz were also used for upholstery. Slip covers in prints and plain fabrics continued to be popular due to the difficulty in obtaining new furniture; they also helped give a new, fresh look to rooms.

Floor Coverings.—Tufted and various shaggy type rugs, the majority being made of cotton, some of wool, were quite the style and there was a decided change from multicoloured, patterned floor coverings to plain, textured rugs and carpets. This helped give the feeling of restfulness and simplicity which was one of the aims of decorating at this time.

Lamps.—Restrictions were placed on the manufacturing of lamps in October, which limited designs to some extent; however, there were styles for either modern or traditional settings, based on motifs characteristic of various periods of design. Pottery bases were more prevalent than other materials though glass, wood, plastics and some metal were used. Bases were in various forms such as human figures, heads, animals, vase and urn shapes and geometric designs. Parchment, paper and fabric comprised most of the lamp shades, which could be tinted any colour to harmonize with the scheme of rooms. In most instances little trimming was used on shades.

Wall and window treatment, lighting fixtures, and decorative accents showed no noticeable change over 1941.

Summary.—The trend toward contemporary design continued, though due to numerous government restrictions on raw materials more attention was turned toward developing substitute designs for those already established than toward developing new ones. (G. M. J.)

International Labour Conference: *see* INTERNATIONAL LABOUR ORGANIZATION.

International Labour Organization.

The resolutions of the International Labour conference, New York-Washington, Oct.–Nov. 1941, furnished the work program for 1942. The Emergency committee, acting for the governing body, met in London in April to consider proposals of Acting Director Edward J. Phelan and to find ways and means to fit the I.L.O. for its part in preparation for postwar reconstruction.

I.L.O. collaboration with governments, national reconstruction and other international agencies increased, beginning with the presence at the London meeting of Sir Frederick Leith-Ross, chairman of the Inter-Allied Postwar Requirements committee, and Alexander Loveday, director of the League's Economic, Financial and Transit section. Another valuable aspect of collaboration was the clearing house function of the I.L.O. in the exchange of information on postwar reconstruction planning, and public works development, especially concerning measures requiring international technical or financial co-operation. Information immediately available required 16 additional pages in the monthly *International Labour Review.* Memoranda were furnished on request to Argentina, China, Iraq and Venezuela. Two I.L.O. experts on social insurance proceeded to London to give evidence before the Beveridge committee.

New emphasis was placed on economic studies and policies as a means of achieving social objectives. The organization must be equipped to scrutinize all economic and financial propos from whatever source derived in order to consider their soc consequences, to make suggestions for their improvement to t competent authorities and throw the whole weight and support its 20 years' experience and its tripartite constituency back of proposals that do not run counter to the social objectives whi are its special prerogative to defend and promote.

The publications of the year reflected the same trend in m terial published in the *International Labour Review, Industr Safety Survey,* and the *Year-Book of Labour Statistics* (in its si year and issued in a tri-lingual edition, including Spanish). The *L islative Series,* issued quarterly, and giving translations of la decrees and regulations affecting labour, is unique and invaluab

Special studies and monographs included: *Wartime Transf ence of Labour in Great Britain* (163 pp.); *Food Control in Gr Britain* (272 pp.); *Approaches to Social Security* (100 pp.); *ternational Comparisons of Food Costs* (83 pp.); *Food Consum tion and Dietary Surveys in the Americas* (64 pp.); *The Int national Seamen's Code* (55 pp.)—contains the conventions a recommendations affecting maritime employment adopted by International Labour conference, 1920–36.

The New York conference recommended that the I.L.O. represented in any peace or reconstruction conference follow World War II, not for the prestige such action would confer, for the service its resources and experience enable it to render.

The sixth Canada-United States tripartite meeting to consi questions of labour supply of interest to both countries was h in Montreal in August 1942. The documentation was prepa by the office. The discussion dealt chiefly with the Canadian s tem of employment control which went into effect Sept. 1, 19 and with the Canadian and U.S manpower position.

The first Inter-American Conference on Social Security held in Santiago, Chile, in September, and attended by delega from 21 American countries. The governing board of the I.L was represented by a tripartite delegation headed by Paul Zeeland, former prime minister of Belgium. The declarations conclusions of the conference showed unusual preparedness unity in dealing effectively with the most difficult pledge of Atlantic charter. A statute was adopted making the conferenc permanent agency of co-operation acting in concert with I.L.O. The conference was official and owed its inception larg to the governments of Chile and Peru, but much of the initiat and success was due to I.L.O. nursing care and expert guida For detailed reports, see *Int. Lab. Rev.* XLVI, No. 5 (Nov.) 606–18, and No. 6 (Dec.), p. 661–91.

The twelfth session of the Joint Maritime commission met London in June 1942. Including deputy members and advis 64 persons, representing 15 nations, took part in the discuss of the acting director's report on the maritime work of the I.L since the last meeting of the commission in 1935. Practica every aspect of the maritime industry in conditions of war debated, and 14 resolutions were unanimously adopted on men's welfare and life-saving appliances. For detailed rep see *Int. Lab. Rev.* XLVI, No. 2 (Aug. 1942).

Costa Rica, member from the beginning, had allowed its I.L membership to lapse in 1927 but was readmitted in Nov. 19 Mexico deposited the latest ratifications in June and July 194 the 883rd and 884th ratifications of a convention, being the 2 and 30th by that country, and the 3rd of the Holidays with (Sea) convention, 1938, and the 10th of the Statistics of Wa and Hours of Work convention, 1938. (*See* also CHILD WELFA LEAGUE OF NATIONS; REFUGEES.) (S. McC. L.

International Law.

Mexico.—The expropriation of eign-owned oil properties effected

3 came to a head in 1942 by the award of a two-man ap- sal commission which appraised the American properties as th something over $23,000,000, as contrasted with a company n of value in excess of $100,000,000. Although the department tate had historically insisted that the subsoil petroleum was er the law of Mexico owned by the surface owners, and al- gh an assurance was extended by Secretary Hull in Oct. 1941 the American appraiser, Mr. Cooke, would take these subsoil es into account, the figure arrived at was a blind one in that it not specify the constituent items that made it up. Subse- tly, the Mexican supreme court held that in the case of two panies, Titania and Mercedes, not named in the expropriation ee, the property was not legally expropriated and presumably ld be returned to its owners. Other such cases were pending e end of 1942. A settlement with the British-owned com- es had not been effected at the close of the year.

e general claims against Mexico, dating back to 1868, were ed during the year by the ratification of an agreement to pt in payment $40,000,000 over a long period of years. 00,000 had already been paid, and on the balance not less than 00,000 annually had still to be paid. Relatively few awards made by the Mixed Claims commission under the treaty of . Additional claims were agreed upon by two commissioners 934 and 1935. Under an act of Dec. 18, 1942, a domestic mission of three commissioners would be set up to make ds on the unsettled claims. The so-called special claims g out of the revolution in Mexico between 1910 and 1920 settled during the 1930s.

livia.—On Jan. 27, 1942, the United States department of , through Sumner Welles, effected an agreement with Bolivia he payment of $1,500,000 with 3% interest from March 13, , because of the executive cancellation by President Toro e concession of the Standard Oil Company of Bolivia, a diary of the Standard Oil Company (N.J.). The company d to this sum as payment for the voluntary sale of its prop- s, which represented a much larger investment, but perhaps reater value. The unilateral cancellation for alleged but un- ed fraud allegedly committed in 1925 was accompanied by flagrant acts by Bolivia, such as the deportation of the com- 's lawyer in Bolivia, the cutting down by decree of the te of limitations from 30 years to 90 days, a violent cam- against the supreme court, threatening their lives if they led against the government, and a denunciation of all law- who gave opinions in favour of the company. The supreme dodged the issue by concluding that the local represen- e of the Bolivian subsidiary held no proper power of at- y, and that the assignment of the concession by the pred- or company to the Standard had not received government oval in advance, although the government had never there- e raised the question. Payment was made April 22, 1942.

ance.—The relations of the United States with the Vichy rnment of France presented a number of political and legal lems somewhat unprecedented. Although the Vichy govern- was under the control of Germany, relations with the United s were not broken until Germany occupied southern France. United States adopted the policy, which had support in in- tional law, of dealing with the local governments they found ossession of colonial territories of France in Africa, Asia America. Where these territories were in control of the Free ch, Vichy was not consulted, and Vichy protests were re- d. Thus, local agreements were made or territory occupied adagascar (by the British), in New Caledonia, in Martinique, t. Pierre, in Brazzaville (U.S. consul appointed) and other s in Africa. The policy reached its most prominent exempli- on in North Africa, where the invading U.S. and British forces made their agreements with the Vichy minister Admiral Jean Darlan, a policy which gave rise to some criticism. The general American policy announced by President Roosevelt—before the U.S. break with Vichy—was to hold any occupied French territory in trust for a future French state and government which the United States might recognize.

Occupied Territory—U.S. Property.—The occupation of Holland and other countries of Europe by German military forces led to exceptional measures for the control of Dutch-owned property in the United States. The exiled Dutch government in London, in a proclaimed desire, thus according with United States policy, to prevent Dutch property falling into the hands of the German invader, undertook to "freeze" Dutch-owned property in the United States and prevent even its owner from obtaining control without Dutch and American consent. The New York court of appeals sustained this Dutch (London) measure as a conservatory and not a confiscatory decree, and hence gave it effect in New York.

The Dutch government had also decreed, before the invasion, that American securities which might not be physically removable from Holland, should be destroyed in the presence of a U.S. consul and a substitute security issued therefor in the United States.

Extraterritorial Confiscations.—On Feb. 2, 1942, the United States supreme court decided the case of *United States* v. *Pink,* 315 U.S. 203. This was an unprecedented decision. It held that the soviet government had, under its confiscation decrees, theretofore uniformly refused application to American and other non-soviet situs property, intended to and had confiscated an American bank deposit of a liquidated Russian insurance company in New York, a fund to which foreign creditors and stockholders of the liquidated company had a lawful claim. Since, however, the soviet government had in 1933 by the Litvinov-Roosevelt agreement accompanying the recognition of soviet Russia, assigned to the United States all soviet-owned assets in the U.S., the court held that the United States had now become the owner of the deposited fund of the liquidated insurance company. The decision gave rise to almost universal criticism from students of the subject.

The New York appellate division in a subsequent case, *Bollack* v. *Société Génerale,* 30 N.Y.S. (2d) 83, refused to give effect to a somewhat similar French confiscatory decree, distinguishing the Pink case on the fact that the United States had not taken an assignment from the French government of this property. It might thus seem that a foreign confiscatory decree is invalid in the United States unless the American government becomes the beneficiary thereof. This would be a curious doctrine.

Latin America.—The effort to enlist the Latin American countries in support of the United States war effort against the axis powers found reflection in conferences of the American republics even before Dec. 7, 1941. After that date the policy was accentuated to prevent foreign exchange becoming available to the axis powers, to prevent agents of those powers from using American territory for political purposes, and even to prevent persons on the American blacklist from continuing to do business in those countries. The consideration moving from the United States was not only political but also economic and financial, in buying up many of the raw materials normally exported by those countries to Europe, in sending to them American manufactured goods under an Export-Import bank loan or under lend-lease agreements, and in other ways associating those countries with the American war effort. Many of them declared war on the axis powers. Others broke diplomatic relations. Only two, Argentina and Chile, up to the end of 1942 maintained their neutrality. On Jan. 20, 1943, Chile severed diplomatic relations with the axis. Incidentally, it may be said that the policy of political aid militated against the use of any diplomatic pressure and the efforts of the Foreign Bondholders' Protective council to persuade the defaulting countries of Latin America to resume service on their defaulted bonds, which many of them would now be able to do since they again possess American foreign exchange.

Enemy Patents.—In Dec. 1942 the alien property custodian announced that he was seizing all patents owned by German nationals or by nationals of countries occupied by Germany. This involved approximately 50,000 patents. Those owned by German nationals were to be licensed on a non-exclusive basis without compensation to American industrial concerns for the life of the patent. Those owned by nationals of occupied countries were to be royalty free until six months after the termination of the war. This policy was undertaken without the express consent of congress. It seemed like a confiscation of private property to the extent involved, and might lead to far-reaching results. The confiscation of private property, contrary to international law, did much damage to international relations after World War I, and if again adopted would militate seriously against the possibility of a restoration of healthy international relations.

In Jan. 1942 the department of state issued a circular requesting detailed information as to American property located in enemy or enemy-occupied territories, property far larger in amount than enemy-owned property in the United States.

Angary.—The conduct of the war gave rise to several legal problems which invite attention. The right of angary was invoked by the United States in taking over some Swedish vessels in American harbours Dec. 7, 1941. German and Italian vessels had been taken over theretofore on a theory that they had committed or were about to commit sabotage. It is probable that on these ships compensation would be paid after the war to their private owners. In the case of neutral ships, compensation must be paid under the right of angary, though the "Kungsholm" was actually purchased from its private owners.

An interesting case arose in Mexico which before the war seized the Italian-flag steamer "Vigor" under an alleged right of angary. This is exclusively a war right and not possessed by neutrals. The ship was owned by an Italian company in which the Standard Oil Company (N.J.) owned a 93+ percent interest. The Mexican government promptly chartered the steamer to the U.S. War Shipping administration, which issued a policy of insurance to the Mexican government. The ship was sunk, presumably by submarine. The American company requested that the insurance money be allowed to remain in the United States and 93+ percent paid over to them as the real parties in interest. The War Shipping administration wished to pay the charteree, the Mexican government, the insurance fund. At the end of 1942 the case remained unsettled. It brought up a problem analogous to that of the German ships turned over in 1920 to the Reparation commission, though actually owned by the DAPG, a fully-owned subsidiary of the Standard Oil Company (N.J.).

Prisoners of War.—The principal belligerents agreed, according to a state department release of May 23, 1942, to respect the Geneva 1929 convention concerning prisoners of war and civilian enemy aliens. After the Dieppe commando attack, the Germans charged that the British had tied the hands of prisoners and undertook reprisals on British prisoners. They claimed that an instruction to tie prisoners contrary to the Geneva convention had been issued by the British. Toward the end of 1942, the British announced that they had untied all German prisoners, but by Jan. 1943 no similar German agreement had been announced. There was some dispute as to who began the practice, whether it was not a temporary measure in the battle area, and whether the Geneva convention was actually violated. An vestigation in due course would have to examine these quest (*See* also Prisoners of War.)

Saboteurs.—On July 31, 1942, the supreme court decided saboteur cases involving the right to a jury trial rather than by military commission of eight German so-called saboteurs had landed from an enemy submarine on United States terri had discarded their uniforms, and had orders to commit ho acts involving the destruction of life and property. The sup court unanimously held (Justice Murphy taking no part) such persons were not lawful combatants entitled to be treate prisoners of war or subject to a trial by jury, but that they— if citizens—were engaged in "unlawful belligerency," there not committing lawful acts of war and, like spies, could be and sentenced by military commission. Six were executed. parte *Quirin,* 63 Sup. Ct. Rep. 2. (E. Br

International Trade.

In view of the unavailability most of the pertinent data, it is possible to prepare the usual article on international trade 1942. (*See* Agriculture; Business Review: *U.S. For* *Trade.*) (C. L. W

Trade Agreements.—The signing of reciprocal trade a ments with Peru on May 7, Uruguay on July 21, and Mexic Dec. 23, marked the outstanding developments of 1942 in trade-agreements program of the United States under the originally approved on June 12, 1934.

Conclusion of reciprocal trade agreements with Peru, Uru and Mexico in 1942 increased to 15 the number of Amer republics with which such agreements have been concluded. earlier agreements were with Argentina, Brazil, Colombia, C Rica, Cuba, Ecuador, El Salvador, Guatemala, Haiti, Hond Nicaragua and Venezuela.

These agreements helped to strengthen commercial rela between the United States and the other American republics in general, to promote hemisphere solidarity, at a time when was of more than ordinary importance.

In other parts of the world, agreements were concluded the governments of the United Kingdom, Belgium, Ca Czechoslovakia, Finland, France, the Netherlands, Sweden, S erland and Turkey. On April 4, public notice was given of i tion to negotiate an agreement with Bolivia, and a similar n in regard to Iran was issued on July 29. Negotiations with land continued.

The trade-agreements program seeks through negotiations foreign countries the reciprocal adjustment of excessive duties, the reduction of other trade barriers, and the remov trade discriminations. In this way, it promotes an expansi international trade and helps improve international relations erally.

Because of the influence of World War II, there was no able statistical evidence of the effects of the trade-agree program in 1942. However, the results of the program d the prewar period demonstrated its effectiveness as a mea restoring international trade. As a result in large part of the cessions obtained from foreign governments in trade agree and of the reciprocal concessions granted by the United S the tendency in prewar years was for United States foreign —exports and imports—with the trade-agreement countries t crease faster than that with the non-agreement group.

Developments prior to World War II emphasized the fact trade barriers and discriminations are among the under causes of war. Trade barriers, by impeding international merce, caused diminished national incomes, depressed stan of living, unemployment, financial instability and social u ade discriminations led to constantly shifting trade currents, mmercial uncertainty, recriminations and retaliations, trade nflicts and international economic tensions.

The fourth point of the Atlantic Charter recognized that all na- ns, large or small, must have access on equal terms to the de and raw materials of the world needed for their economic osperity. The effectiveness of the trade-agreements program promoting these objectives was demonstrated, and the year 42 witnessed the taking of further steps toward those objectives.

On Jan. 1 the 24 nations then united with the United States d the United Kingdom in World War II and later in 1942, r others, declared their adherence to the Atlantic Charter, reby making it a United Nations Charter. Under Article VII the mutual-aid agreement of Feb. 23 with the United King- m, the two governments agreed to seek, by international and mestic measures, the expansion of production, employment, d the exchange and consumption of goods; the elimination of criminatory treatment in international commerce and, in gen- l, the attainment of the economic objectives of the Atlantic arter. Similar mutual-aid agreements were entered into with ina, Soviet Russia, Belgium, Poland, the Netherlands, Greece, echoslovakia, Norway and Yugoslavia; Australia and New aland accepted the principles of the United Kingdom agree- nt as applicable to U.S. mutual-aid arrangements with them; d Canada pledged co-operation in the attainment of the objec- es of Article VII, although Canada had not sought lend-lease istance. Mutual-aid agreements with other countries were in spect.

The trade-agreements program provided the most effective chanism for the nations of the world to work as partners in establishing the commerce of peace in accordance with the antic Charter and Article VII of the mutual-aid agreements. tive participation by the United States in the councils of the ited Nations, looking toward the attainment of the objectives eady agreed upon seemed indispensable to the welfare and se- ity of the United States. United States co-operation seemed essary to the establishment of a solid economic foundation whatever structure of international security the victorious ited Nations might build. Without such a foundation the ucture could not stand, if it could be built at all; world se- ity against war and aggression could not be erected on a morass restrictive trade barriers and discriminatory trade arrange- nts.

terstate Commerce Commission.

The interstate commerce com- ssion, established Feb. 4, 1887, for the regulation of carriers gaged in interstate commerce, consists of 11 members ap- nted by the president. From its membership the commis- n selects its chairman (Clyde B. Aitchison in 1942). On a vir- l leave of absence as commissioner in 1942, Commissioner seph B. Eastman was serving as director of the Office of De- se Transportation (*q.v.*) and Commissioner John L. Rogers s acting as director of the division of motor transport in that ce, which also utilized the services of many of the commis- n's employees.

In 1942 the carriers subject to the commission's jurisdiction re called upon to carry a heavy burden of wartime transporta- n, and many changes in their normal modes of operation and nnels of traffic were necessary. Railroad freight traffic was the hest on record, and passenger travel was heavier than it had n for many years. To some extent this rise was augmented by continuance of much water transportation along the coasts, but and water traffic increased. Motor truck and bus traffic was also in larger volume than it had been in previous years. The unexpected necessity for the strictest economy in the use of tires and motor fuel forced the motor carriers generally to make radical changes in their routes and schedules. All these factors brought numerous regulatory problems to the commission in addition to routine duties.

To prevent transportation wastes, the commission issued a number of emergency service orders directed to railroads and motor carriers, with respect to which its emergency powers were broadened by legislation during 1942. These measures were supplemented by the activities of an enlarged staff of field agents engaged in avoiding transportation congestion at individual points.

In the early part of 1942 the commission investigated petitions for increased rates and fares, principally of the railroads, with corresponding increases for other forms of transport carriers, required to meet higher wages and other operating costs. The commission authorized increases of about 3% in the rates on the basic products of agriculture, animals and mineral products, and of 6% on other commodities, except iron ore. An increase of 10% was permitted in passenger fares. All these increases were limited to the war period and 6 months thereafter.

During the year congress enacted legislation which broadened the commission's jurisdiction to include freight forwarders and defined their duties and rights. (C. B. A.)

Intestinal Disorders: *see* Alimentary System, Disorders of.

Intoxication, Alcoholic.

A report by the "Committee for the Study of Problems of Motor Vehicle Accidents," served to clarify the controversy that had heretofore revolved about the proposal of the National Safety Council that a person is drunk when the concentration of alcohol within the blood is 150 mg. or more per each 100 cc. Experimental evidence indicated that a concentration of 150 mg. will always affect visual acuity but that such concentration was too great a criterion of drunkenness for some persons and too little for others. The committee, however, interpreted the results of chemical tests for alcohol concentration in blood as follows: Persons with a concentration of 0.15% or more are intoxicated; concentration of 0.05% or less are not under the influence of alcohol; and concentration between 0.05% and 0.15% are likely to be influenced and are considered intoxicated only when a supplemental medical examination gives objective confirmation of such influence. According to the report fatal traffic accidents associated with drinking showed an increase, the greater increase, however, involved drinking drivers. Fatal accidents involving intoxicated pedestrians also increased.

The value of chemical tests for the concentration of alcohol in the blood was recognized as admissible evidence before courts of law and the year 1942 witnessed an increase in the prestige of expert testimony in this field.

There were no new methods proposed in 1942 for the treatment of alcoholism. Contributions dealt with heretofore used measures. The year witnessed, however, debarment of fraudulent schemes from the mails and the discontinuance of misrepresentations in advertising, either by agreement or by prosecution, of false claims about the value of substances to be used for the treatment of alcoholism or the removal of a desire for "drink."

The medical, public health, sociological and economic aspects of the alcohol problem continued in large measure to be ignored for those ever-present moral, profit and revenue issues that had so long dominated measures and policies for its solution. In France, however, a new law endorsed by the French Academy of Medicine restricted the number of bars, rationed the sale of wine and liquors, empowered the Board of Health to interdict the sale of drinks considered noxious, and allowed for the observation and hospitalization of drunkards. Iodine. The production of iodine in the United States was not reported after 1937, when it was 299,286 lb., but it is known to have increased each succeeding year. Imports from Chile were so irregular that the figures had little significance; of more importance was the fact that the average value per pound of the imports increased from 84 cents in 1939 to $1.13 in 1941. (G. A. Ro.)

Iowa. A north central state of the United States, admitted as the 29th state on Dec. 28, 1846; popularly known as the "Hawkeye state." Area, 56,280 sq.mi.; pop. (1940) 2,538,268. The urban population was 1,084,231; rural was 1,454,037, of which 916,768 lived on farms. Of the total population, 2,403,446 were native whites, 117,245 foreign-born whites, 16,694 Negroes and 883 other races. Capital, Des Moines (159,819). Other principal cities: Sioux City (82,364), Davenport (66,039), Cedar Rapids (62,120), Waterloo (51,743) and Dubuque (43,892).

BOURKE B. HICKENLOOPER, elected Republican governor of Iowa Nov. 3, 1942

History.—The officers elected Nov. 3, 1942, to take office on Jan. 1, 1943, all Republicans, were: governor, B. B. Hickenlooper; lieutenant governor, Robert D. Blue; auditor, C. B. Akers; treasurer, W. G. C. Bagley; secretary of state, Wayne M. Ropes; secretary of agriculture, Harry D. Linn; attorney general, John M. Rankin; and superintendent of public instruction, Jessie M. Parker.

Education.—For the school year 1940–41, 358,527 pupils were enrolled in public elementary schools, 137,646 in public high schools and 2,489 in public junior colleges.

Public Welfare, Charities, Correction.—For the year 1942–43 the state appropriated $8,500,000 for old-age assistance, $500,000 for state emergency relief and $260,000 for child fare and aid to the blind. On July 1, 1942, the state mainta 15 penal, correctional and eleemosynary institutions, with a t of 14,463 inmates.

Table I.—*Leading Agricultural Products of Iowa, 1942 and 1941*

Crop	1942 (est.)	1941
Corn, bu.	596,796,000	462,519,000
Oats, bu.	201,435,000	176,702,000
Hay, tame, tons	6,709,000	5,518,000
Soybeans (grain), bu.	39,312,000	16,014,000
Soybeans (hay), tons*	486,000	446,000
Barley, bu.	4,818,000	7,315,000
Wheat, bu.	4,749,000	2,341,000
Potatoes, bu.	6,600,000	5,508,000
Rye, bu.	368,000	256,000

*Included also in the figures for tame hay.

Table II.—*Principal Mineral Products of Iowa, 1940 and 1939*

	Production, 1940	Value, 1940	Value, 19
Cement	4,605,886 bbl.	$7,641,163	$7,771,50
Coal	3,231,177 tons	8,045,630	7,503,00
Gypsum	487,379 tons	587,223	510,12
Sand and gravel	3,464,803 tons	1,852,285	1,299,44
Stone	4,013,740 tons	3,832,070	4,385,23

Finance and Banking.—Taxable property in Iowa was mated at $3,000,000,000 in 1942. The income of the state ernment for 1941–42 included $5,000,000 from the general p erty tax and some $52,748,078.64 from other taxes. The balanc the state treasury on June 30, 1942, was $29,507,779. There 103 national banks in Iowa on June 30, 1942, with deposits of $3 671,000, and 545 state banking institutions with deposits of $5 572,568. The state banks reported resources of $616,591,014.

Communication.—On July 1, 1942, 5,459 mi. of primary r in Iowa were paved, and 3,061 mi. were gravelled or other surfaced. Of the secondary road system, 45,164 mi. gravelled. For the fiscal year 1941–42 construction work on primary roads cost the state $7,353,600. On Jan. 1, 1941, t were 8,980.7 mi. of steam railroads and 431 mi. of interu tracks. Iowa in 1942 had approximately 10,385 mi. of teleg lines and 79,358 mi. of telephone lines.

Agriculture.—The total value of agricultural productio Iowa in 1942 from the 21,530,300 ac. harvested was estimate $707,272,000.

Manufacturing.—The total value of products manufact in Iowa in 1939 was $718,531,801. There were 2,670 manufa ing establishments with 11,501 salaried employees who rece $23,535,779, and 65,314 wage earners who received $73,466 Meat packing headed the list of industries, employing about sixth of the wage earners. The products were valued at $ 314,633. Second in value was butter, with a product value $60,380,974.

Mineral Production.—Iowa ranked 29th among the state importance of minerals in 1939; the total value of such proc in that year was $25,483,936. (R. A. G

Iowa, State University of. An institution of higher cation at Iowa City, Ia. established Feb. 25, 1847. It was the first state universit admit women on equal standing with men.

Geared to the war effort, the university began an acceler schedule in Jan. 1942, operating to graduate many student much as five months ahead of normal. Special courses were es lished, and confidential research work was instituted.

Facilities of two men's dormitories and the field house sports fields were leased to the U.S. navy for a naval avia pre-flight school for 2,400 cadets. More than 50 men of pr sorial rank entered some type of government war service.

For statistics of enrolment, faculty, library volumes, etc. Universities and Colleges.

wa State College. A land-grant college at Ames, Ia. During 1942, instruction in depart- ents whose work could not contribute directly to training men d women for the war effort was subordinated. The college be- n operating on a continuous 12-month basis. Three navy tech- al schools were established under which sailors were trained electricians, diesel mechanics and cooks and bakers, at the rate 6,000 a year. A laboratory building was constructed to house e diesel trainees. Fifty men at a time were trained as army d navy pilots. Construction of a new men's dormitory was mpleted. Extensive research of a secret nature was performed r the war department, as well as research bearing upon food oduction. During the year, 3,518 civilians were given various es of war industry training at points throughout Iowa.

For statistics of enrolment, faculty, library volumes, etc., *see* IVERSITIES AND COLLEGES.

an. Known before March 1935 as Persia, a country of western Asia bounded on the east by India and Afghanistan, the north by the U.S.S.R., on the west by Iraq and Turkey, d on the southwest and south by the Persian gulf and Arabian a; ruled after 1926 as a constitutional kingdom. Ruler: Shah hammed Reza; premier (1942): Qavam as-Saltaneh. Area, *c.* 8,000 sq.mi.; pop. (est.), 15,000,000. Chief towns: Tehran p., 360,000), Tabriz (220,000), Meshed (140,000), Shiraz 20,000), Isfahan (100,000). Language, Persian; religion, Mo- mmedan.

History.—The outstanding event of the year was the signature, Jan. 29, of a treaty of alliance with Great Britain and the S.S.R. This treaty, which was explicitly based on the principles d down in the Atlantic Charter, opened with a guarantee by two belligerent Allies of Iran's territorial integrity and politi- independence. They undertook to defend it against any aggres- n, and in return they were granted facilities for the passage of ops and supplies, including if necessary the control of all means communication throughout Iran. The assistance to be given by nian troops, in the event of an attack upon the country, was be limited to the maintenance of internal security. The allied vernments undertook to safeguard as far as possible the eco- mic life of Iran. Their forces were to be withdrawn from nian territory not later than six months after the cessation of stilities, and the treaty would then cease to operate. It was companied by an exchange of notes, in which Iran was assured a place at the peace conference and in any negotiations directly ecting its interests, and the Iranian government undertook to er diplomatic relations with any state having such relations ither with London nor with Moscow.

Iran's relations with Japan were not covered by this pledge, t the Japanese minister was asked to leave the country in ril, after the unfriendly activities of the legation had been dis- sed in the course of a drive against axis agents.

The tripartite treaty was accepted in Iran without enthusiasm, t it was not the cause of the fall, at the beginning of March, the government which had concluded it. Dissatisfaction with . Foroughi's administration arose rather from the rising cost of ing, food shortages and the breakdown of security in the tribal eas. Similar difficulties undermined the authority of his suc- ssor, M. Suhaili, who gave way in August to M. Qavam as- ltaneh.

Iran, like other middle eastern countries, had a poor harvest in 41, and the effective yield was further reduced by local dis- rbances, hoarding and speculation. The consequences might ve been serious but for British and Russian imports of grain, ounting to nearly 100,000 tons in the 12 months following the try of their troops into the country. The Allies, including the United States, also carried out considerable improvements in Iran's internal communications, with the primary object of enlarging the flow of military supplies to southern Russia. Numbers of British locomotives were imported, a new railway was built from Ahwaz to Khorramshahr, port facilities on the gulf were greatly increased, and the road and railway systems were improved and extended. On May 2 Iran was made eligible for assistance under the lend-lease act. An American educational mission was invited to report on education in Iran, and American advisers were engaged by a number of ministries. (H By.)

Education.—(1937) 4,939 schools; 273,600 scholars; one university at Tehran.

Banking and Finance.—Revenue, ordinary (1940–41) 3,613,768,000 rials; expenditure, ordinary (1940–41) 4,323,911,000 rials; foreign loan (May 15, 1940) £951,706; public debt (Dec. 31, 1938), 98,900,000 rials; note circulation (Dec. 31, 1941) 1,585,000,000 rials; gold reserve (Dec. 31, 1941) 310,949,000 rials; exchange rate (1942) 1 rial=2.857 cents.

Trade and Communication.—Foreign trade (merchandise) 1940–41: imports 1,018,700,000 rials; exports 2,253,500,000 rials. Communications 1938: roads fit for wheeled traffic, *c.* 8,700 mi.; railways open to traffic, 1,072 mi.

Agriculture and Minerals.—Production, est. 1937–38 (in metric tons): petroleum, crude (1940), 10,426,000; wheat, 1,942,300; barley, 706,900; rice, 382,100; cotton (1940–41), 50,000; wool (1940), 15,500; beet sugar (1939–40), 25,200; tobacco (1940–41), 12,700.

Iraq. An Arab state of the near east, between Iran, Syria and Arabia, watered by the Tigris and Euphrates; an independent kingdom after 1932, when the British mandate was terminated. Area, 116,000 sq.mi.; pop. (census Oct. 1934) 3,561,000 (est. Dec. 31, 1939), 3,700,000. Chief towns: Baghdad (cap. 400,000), Mosul (260,000), Basra (180,000). Ruler: King Feisal II; regent: Prince Abdul-Ilah; premier (1942): General Nuri es-Sa'id; language: Arabic; religion: Mohammedan.

History.—The year opened with the trial of the principal military and civilian leaders of the coup d'état of May 1941. Six of them, including Rashid Ali al-Jilani were condemned to death in absentia. Four of these, two of Rashid Ali's ministers and two of the military conspirators, were tried again after being handed over to the Iraqi government by the British military authorities who had previously interned them at Ahwaz. The second trial resulted in three death sentences, on Mahmud Salman, Fahmi Sa'id and Yunus as-Sabawi; they were executed on May 5. Measures were also taken to purge the army of disaffected elements, and to intern enemies of the regime.

General Nuri es-Sa'id resigned and formed a new cabinet in October. Twice during the year, on United Nations day and in an exchange of messages with Winston Churchill, he took occasion to reaffirm his view that the hope of realizing Arab aspirations lay in the victory of the United Nations. He also announced, in August, that Iraq would fight beside the allies if the German armies broke through the Caucasus and threatened its frontiers.

An Iraqi legation was established in Washington, the first minister, Ali Jawdat al-Ayyubi, presenting his credentials to President Roosevelt on May 4. Two days earlier, Iraq had been declared eligible for assistance under the lend-lease act. Wendell Willkie was received with enthusiasm when he visited Baghdad in September.

As elsewhere in the middle east, the authorities were preoccupied with the problem of food supply. The export of wheat was forbidden and the surplus, above the needs of the cultivators for food and seed, was requisitioned by the government. Attempts were made, by price-fixing, to arrest the rise in the cost of living.

Iraq's internal communications were of increasing importance as supply routes for Russia and Turkey. Their development, notably by improvements in the port of Basra, was accelerated by the British military authorities and the United States military mission. Transit trade had doubled in 1941 by comparison with 1940, and figures for the early months of 1942 pointed to a continued increase.

BRITISH TOMMIES having a shoeshine in Baghdad, Iraq

The exiled ex-premier, Rashid Ali al-Jilani, was active in Rome and Berlin, where he issued statements asserting his confidence in the friendly intentions of the axis powers toward the Arabs and calling for hostility to Britain. (H. By.)

Education.—In 1938: elementary schools, government, 741; scholars, 94,368; new schools opened 1938–39, 22; secondary schools, 14; scholars, 1,904; intermediate schools, 48; scholars, 10,611.

Finance.—Revenue, ordinary (est. 1941–42) 6,800,000 dinars; expenditure, ordinary (est. 1941–42) 6,700,000 dinars; notes in circulation (May 31, 1942) 13,500,000 dinars; foreign assets reserves (May 31, 1942) 15,000,000 dinars; exchange rate 1942 (currency based on sterling): 1 dinar=£1 sterling=approx. 403.5 cents.

Trade and Communication.—Foreign trade 1941 (merchandise): imports 6,948,000 dinars; exports, domestic (excluding crude petroleum) 3,906,000 dinars. Communications: roads open to traffic (1940) *c.* 4,000 mi.; railways, open to traffic (June 1940) 947 mi.

Agriculture and Minerals.—Production 1938–39 (in metric tons): petroleum, crude (1940) 3,438,000; wheat, 600,000; rice, 360,000; barley, 1,138,400; tobacco, 4,000; wool (1938) 8,300; cotton (1940–41), 3,600; cotton seed (1940–41), 8,500.

Ireland: *see* EIRE.

Ireland, Northern.

Northern Ireland comprises the six counties of Antrim, Armagh, Down, Fermanagh, Londonderry and Tyrone, forms part of the United Kingdom of Great Britain and Northern Ireland, but (since 1920) has its own parliament and executive, with limited powers for local purposes, though also represented in the imperial parliament by 13 members. Area, 5,238 sq.mi.; pop. (June 30, 1938), 1,285,000. Chief cities (pop. census 1937): Belfast (cap. 438,086), Londonderry (47,813). Language: English; religion: Christian (Roman Catholic, 33.75%; Presbyterian, 31.4%; Episcopalian, 27%). Ruler and national flag, as for Great Britain. Gov.: the duke of Abercorn; premier: John Miller Andrews.

History.—During 1942 the parliament of Northern Ireland was occupied with legislation necessitated by wartime conditions. Measures of outstanding importance were those providing for the nationalization of the fire service and for ensuring the maint nance of adequate electricity supplies in an emergency. Throu the ministry of commerce and production, working in conjuncti with the appropriate departments of the British government, clo contact was maintained with all branches of war production. the industrial field there was a marked expansion of output, t industrial capacity of the area having been more fully geared to meet the increasing demand for war supplies.

The Northern Ireland ministry of agriculture, acting on beha of the ministry of food, continued to be responsible for the pu chase, sale and distribution of most of the principal articles home-produced food. For example, more than 300,000,000 eg were shipped to Great Britain in 12 months after meeting lo rationing requirements. Flax production, which had been mo than quadrupled during the first two years of war, continued increase, thus helping to supply the needs of linen factor engaged on essential war contracts.

In introducing the budget, the minister of finance announc that the provisional contribution to the imperial treasury f 1942–43 would be £21,300,000. The estimated exchequer recei were £41,797,000. Stimulated by a series of special campaig the Ulster savings movement achieved a series of successes. Th total sum raised in war savings by the people of Northern Irela between Nov. 1939, and the middle of Nov. 1942, exceed £55,000,000.

An announcement in parliament by the prime minister d closed the character and scope of the government's plan for po war reconstruction. The program included schemes for improv housing and town planning, cheap electricity and transport fac ties, the widening of educational opportunities for youth, the e pansion of health services, the development of linen exports, f production within the province, and improvements in local go ernment administration.

The life of parliament was prolonged by special legislation view of the undesirability of holding a general election in t midst of a world war. (R. D. B.)

Education.—In 1941–42: elementary schools, 1,681; schola 183,872; secondary schools, 75; scholars, 14,772; university st dents, 1,626; technical schools, 60; students, 20,462.

Finance.—Revenue (1941–42), £34,932,138; expenditure (cluding £15,900,000 imperial contribution, and surplus £42,47 £34,932,138; 1942–43, estimated revenue, £41,797,000; estimat expenditure (including £21,300,000 imperial contribution, a surplus £84,000), £41,797,000; exchange rate (1942) £1 = 40 cents U.S.

Trade and Communication.—External trade 1938: impor £54,385,000; exports, £51,061,000. Communications 1939: roa fit for motor traffic, 13,043 mi.; railways, standard gauge, 741 m narrow, 121 mi., canals, 180 mi. Shipbuilding, tonnage launch (1938), 79,468; value of linen goods exported 1938, £5,480,000.

Agriculture.—Total area under crops 1942, 1,263,131 ac., cluding 522,050 ac. cereal crops, 187,320 potatoes, 72,916 flax a 435,429 ac. hay. Cattle 826,651; sheep 741,601; pigs 271,22 poultry 13,339,558. In 1941–42, cattle and sheep to value £2,820,000, bacon and pigs to value of £2,480,000, eggs £3,50 000, potatoes £850,000, and fruit more than £500,000 we shipped from Northern Ireland to Great Britain. In additi about 100,000 gal. of milk per month were shipped during t winter months.

Irish Free State: *see* EIRE.

Iron and Steel.

As a matter of convenience the treatm of the general field of iron and steel subdivided into the three heads, iron ore, pig iron and steel. Ho er, there is little to record, since data were suppressed in all jor countries outside of the United States, and in most of the nor countries as well. Hence, such data as are presented in the les since 1939 is scanty, and includes many estimates.

Iron Ore.—Such data as was received on iron ore output in ent years is presented in the accompanying table. Later figures re available only from the United States.

ron ore production in the United States increased by 25% in 1, to 92,499,300 long tons, a new record high. Of this total Lake Superior district produced 79,130,250 tons but shipped 210,600 tons. The only information available on 1942 is the e Superior shipments, which rose to approximately 92,000,000 s. This would indicate a total output of something like 105,-,000 tons for 1942.

ig Iron.—Some of the 1939 and most of the 1940 figures in world table are estimates, and later data were received only n the United States and Canada.

last furnace production in the United States rose from 47,-,529 short tons in 1940 to 56,686,604 tons in 1941, of which 100,551 tons was pig iron and 1,586,053 tons ferro-alloys. nts worked at an average of 97.1% of capacity during 1941, reached 102.3% in December. In 1942 production through October was 49,133,042 tons of pig iron, and total production for the year would probably somewhat exceed 60,000,000 tons.

Canadian production totalled 1,741,273 short tons in 1941, 1,528,054 tons of pig iron and 213,219 tons of ferro-alloys. Through October 1942, the total of 1,817,391 tons included 1,640,055 tons of pig iron and 177,336 tons of ferro-alloys, the total being 34% above that for the same period of 1941, and in excess of the 1941 total.

Steel.—As with pig iron, much of the 1939 and 1940 data in the accompanying world table is based on estimates. Later data were received only from the United States and Canada.

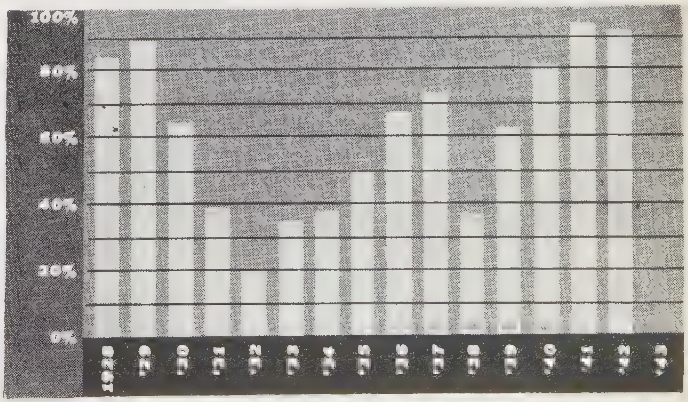
Steel production in the United States showed successive increases over the preceding year of 27% in 1940, 24% in 1941 and 5% in 1942. The 1941 total was 82,836,946 short tons, an average of 97.3% of capacity. With plants already at near capacity all through 1941, and with only comparatively small new capacity made available, the increase in 1942 was considerably less than in the preceding years; production through November totalled 78,789,230 tons, and should approximate 86,500,000 tons for the full year of 1942. For some time production was cramped by scarcity of scrap, but this was remedied at least for the time being by a drive for scrap collection. The total scrap consumed in the steel industry in 1941 was 59,216,256 short tons, of which 33,904,680 tons was plant scrap and 25,311,576 tons was purchased scrap; in the first three-quarters of 1942 the total was 40,394,000 tons, including 22,755,000 tons of plant scrap and 17,639,000 tons of purchased scrap. These figures are respectively reductions of 9%, 11% and 7% from the corresponding 1941 averages. Stocks of scrap increased from a low of 4,324,000 tons at the end of



STEEL PRODUCTION in the United States; monthly average percentage of capacity (figures compiled by American Iron and Steel Institute)

April 1942 to 5,545,000 tons in September.

The Canadian steel output increased to 2,701,313 short tons in 1941, and to 2,580,715 tons in the first ten months of 1942, indicating a total in excess of 3,000,000 tons for the full year of 1942. (*See* also Business Review; Metallurgy; War Production, U.S.) (G. A. Ro.)

Iron and Steel Institute, American: *see* American Iron and Steel Institute.

Irrigation.

United States.—Throughout the western mountain states, snow surveys are made by the federal government during the late winter months to provide information regarding the expected run-off during the following irrigation season. From this information forecasts are made each month from Feb. 1 to May 1, summarizing the irrigation water supply outlook. The accumulated snow survey data gathered over previous years permits of forecasting the coming run-off within 10% of the actual amount for the period April to July, inclusive. For some drainage basins, where other factors are introduced in the forecast equation, the deviation between the predicted and actual flows has sometimes been even less than 10%.

The water supply throughout the irrigated west during the year 1942 was, on the whole, adequate. In Colorado, Wyoming and New Mexico the water held in storage reservoirs during the spring months practically assured the irrigation requirements, during the summer months. The stream flow during the irrigation season, together with timely precipitation, made possible the holding of reserve water in reservoirs so that by Nov. 1, 1942, many reservoirs remained practically full.

In the Columbia river basin, prediction of a sufficient irrigation water supply was supported by the fact that there was no shortage of irrigation water in that basin during the 1942 season.

Oregon water supply prospects for 1942 at the time of issuance of the annual forecasts in the spring varied for the several regions from ample to critically short. State-wide prospects differed greatly because of varying deviations from normal of mountain snow-stored water and holdover reservoir water supplies. Shortages of greater or less extent were foreseen for the Walla Walla river basin, parts of the Deschutes river basin and parts of southern Oregon.

Later precipitation, however, occurring after the close of the snow water forecasts resulted in stream flow sufficient to supply adequate irrigation water for the year.

California had one of its best water-supply years and there was general replenishment of ground-water supplies in the areas dependent on that source of supply.

There was no remarkable construction of works or expansion of irrigated areas in any of the non-federal irrigation enterprises except that of the Imperial valley, California. In that area, the Imperial Irrigation District reported the placing of the All-American canal in full operation since Feb. 1942. From that date on, the All-American canal supplied the entire water requirements of the district. For some time prior to full operation of the canal "priming" or sealing operations were carried on, and marked decrease of seepage losses was noted.

Construction work was nearly completed on the first 75 mi. of the 130-mi. branch of the All-American canal to Coachella valley. Because of war restrictions, however, it appeared that completion of the remainder of the canal might be delayed.

The foundation for expansion of irrigation by the United States bureau of reclamation to meet war or postwar conditions in the west was strengthened during 1942. At the same time emphasis was shifted in the bureau's construction program to the completion of multiple-purpose dams and the installation of electric facilities that would quickly increase the power supply in strate areas in the Pacific and Intermountain regions. The construct of canals and other irrigation facilities, however, was halted retarded by the diversion of critical materials to more urgent purposes. (*See* also Dams.)

The storage capacity of reclamation reservoirs increased 2 to 61,610,283 ac.-ft. during 1942, while the volume of sto water available for power, irrigation, domestic and industrial u increased from 41,500,000 to 47,250,000 ac.-ft.

Preliminary reports for the crop season of 1942 indica that nearly 4,000,000 ac. of land were irrigated by reclamat projects. This area for the first time included the Imperial va of southern California which received its complete supply thro the All-American canal of the Boulder canyon project. The p duction of essential war foods of 45 projects in operation a showed substantial increases in commodities like sugar be alfalfa for dairy and beef herds, vegetables and fruits.

Power installations at multiple-purpose projects of the bur of reclamation increased from 953,962 kw. in July 1941 to 448,362 kw. by Aug. 1942. With the completion of the 2 (Parker dam) power plant on reclamation projects, the t capacity on these multiple-purpose developments was increa to 1,538,362 kw. The bureau of reclamation's projects in ope tion or under construction also permitted of further power pansion in the war emergency. By May 1944 additional insta tions were scheduled which would bring the installed capa to nearly 2,500,000 kw.

The bureau was prepared to supply water in 1942 to 4,915, ac. of land. Projects in the construction program when comple would increase the total area to be served to 12,231,298 ac. this area 5,115,224 ac. were expected to receive a complete full supply of water, and 7,117,074 ac. inadequately irriga by other systems would receive supplemental water or be ot wise benefited by bureau systems.

China.—Although China was at war for more than five ye she continued to carry on reclamation and irrigation proje During 1942 there were completed 258 irrigation projects, tailing an expenditure of about Ch. $137,847,000, benefiting 936,743 mow. in the provinces of Szechwan, Kweichow, Yun Kwangsi, Kwangtung, Hupeh, Kiangsi, Anhwei, Honan, Sh and Kansu. Of the amount of money expended, loans to amount of Ch. $29,324,000 were extended.

Irrigation loans approved for 1942 amounted to Ch. $97,3 300 of which Ch. $77,876,300 would be granted through the j board of the four government banks. The loans would be g to 14 provinces including Sikang and Fukien. The big amounts were to go to Kansu and Shensi where many ca were being built. Kansu was to get Ch. $25,676,300 and Sh Ch. $15,000,000.

The agencies handling irrigation projects financed by the ernment loans were either the provincial irrigation loans com sions organized jointly by the joint board of the four governm banks and the provincial governments or the provincial w conservancy bureaus under the supervision of the joint bo Projects concerning two or several provinces were to be un taken by the National Water Conservancy commission. The j board of the four government banks was giving agricultural l to 317 co-operative banks in 13 provinces.

India.—The Central Board of Irrigation of India contin its research studies into the many phases of irrigation and technical problems such as meandering of rivers, design channels in alluvium, flow of rivers and canals, design of distr tary heads, design of falls or drops, silt excluders and ejec the silting of reservoirs and many other troublesome probl

The India Sarda canal extension project involving the const n of 352 mi. of new channels, 77 mi. of drains and the re-odelling of 225 mi. of existing channels, was near completion. e total cultivable area served by the project was 281,000 ac. e original canal, completed in 1928, took off from the Sarda er on the borders of Nepal, in the north of the United Prov-es and was in 1942 the longest canal in the world.

Mexico.—The principal activities of the Mexican Commission Irrigation during 1942 involved work in the several states of t country. In Chihuahua, the Delicias irrigation district com-ted embankments and lateral structures. The Las Virgenes m, upon which work was started during the year, was expected store 36,481 ac.-ft. of water for irrigation and generation of ctrical energy. The dike on the right hand side of the dam s almost completed and clearing and excavation at the dam e was well along at the close of the year. Also in the state of ihuahua, in the Juarez irrigation district, a portion of the in canal was lined, and the widening and extension of the rranza canal and the intercepting drain were completed. The llway of the Sauza dam was completed. On the canal system appurtenant structures were completed.

n the state of Sinaloa, the Culican irrigation district conserva-n practices and operation of 56,834 irrigated acres were con-ued. Construction on the by-pass tunnel and the Aforador e, which would form part of the Sanalona dam, was begun. is dam when completed was expected to form a reservoir stor-68,800 ac.-ft. of irrigation water and would increase the irri-ed area to 244,000 ac.

n the state of Guanajuato, in the Alta Lerma irrigation dis-t, construction was continued on the Salamanca canal. Con-uction was also continued on the Solis dam, which was begun 1941. The reservoir created by the completion of the Solis n will store 32,428 ac.-ft. The great Angostura dam of the qui river irrigation district was completed during the year and s inaugurated on June 14, 1942.

he irrigation district of the Lagunera region in the states Coahuila and Durango started construction of Palmito dam, ticularly undertaking protective work on the inlet and outlet the tunnels, clearing the sidehills and excavating for the laying the piping in the valve galleries. (*See* also DAMS; DROUGHT; L EROSION AND SOIL CONSERVATION.)

am.

The year 1942 had its repercussions on the Islamic world as on other worlds of thought and life.

ooking at the Mecca annual pilgrimage, whose numbers in ny ways reflect movements in the whole of the Islamic world, find that the number of non-Arabian pilgrims at the Hadj of 2 was only 19,000 instead of the hundreds of thousands ex-ted in normal years. King Abd-ul-Aziz ibn Sa'ud was not per-ally present at the pilgrimage, but made a donation of a sum al to his normal expenditure for the relief of the poor.

he Azhar university in Cairo attained its 1,000th year of life, the celebration of the millenary was postponed on account of war. It was intended to invite to the celebration representa-es of universities from other Muslim countries. This would y be possible after the cessation of the war and the restoration of normal communications in the world.

An interesting development in the direction of better understanding among the Muslims in different countries of the world was reported from Hyderabad (Deccan) in India. The powerful broadcasting station there was broadcasting not only in the Indian languages but also in Arabic and Persian, to reach the whole of the Muslim world.

The Hyderabad quarterly, *Islamic Culture*, for July 1942, contained a further contribution to the discussion of a certain document claiming to contain the text of the letter which the Prophet in his lifetime addressed to the Negus (*Najasi*) of Abyssinia. The fact of such a letter having been sent is generally accepted by Muslims, but the precise terms used are open to argument and discussion.

There was a movement among the Indian Muslims, under the leadership of Mohammed Ali Jinnah, for the establishment of a separate Muslim state to be known as Pakistan, but the idea was still at the discussion stage. (A. Y. A.)

Isle of Man: *see* BRITISH EMPIRE.

Italian Colonial Empire.

The table gives essential information relating to the so-called Italian colonial empire. Except for Albania, the conquest of which in 1939 was not recognized by the United States and Great Britain, and for the Aegean islands, the "empire" at the end of 1942 had practically ceased to exist. Ethiopia was again independent, and most of the remaining African territory was under British military occupation.

History.—After the occupation of Italian East Africa by British and imperial forces in 1941, news from this territory was scanty. In 1942 a railway was planned to link the Sudan with Eritrea, while it was reported that the U.S.A. was establishing a great base for war supplies to the near east in the latter colony.

In Libya, fighting continued and on May 26–27 flared into a gigantic battle when Erwin Rommel attacked the British and imperial forces and by June 26 had succeeded in driving them back across the Egyptian frontier. On Oct. 23, the British and Imperial forces under Gen. Bernard L. Montgomery launched a powerful offensive, dislodging the axis troops from their positions at El Alamein and pursued them far into Libya. (*See* WORLD WAR II.)

War activities in the Italian Aegean islands consisted mainly of

Italian Literature. The year 1942 furnished convincing evidence that Italian cultural life was following the pattern of Italian political and military events. Passive resistance became the most effective weapon against the regime. Fascist literary, art and dramatic critics, aware of this phenomenon, excoriated it in the press. An official of the Fascist Association of Artists stated in the *Corriere della Sera* that the commission for the Venice biennial exhibition "was faced with the dilemma of either calling off the contest, dedicated to 'War and Life Under Fascism,' because of its poor showing, or of interpreting the requirements as broadly as possible." And the art critic of *Regime Fascista* (June 12) was forced to confess: "The contests were an utter failure. . . . We must add that the mediocrity of past years has deteriorated into absolute nullity."

Many complaints were lodged against the "absenteeism" of Italian dramatists. Both the government and the public evidently expected that the war would bring forth "a new word" from Italy's playwrights. But none came. A critic, writing in *Il Piccolo* (June 25–26), explained this dearth as the consequence "not merely of spiritual unrest and insecurity but of material and professional disorientation and bewilderment." The disappearance of an Italian dramatic literature and of an Italian drama technique was candidly acknowledged. Meanwhile, stock companies had to turn to foreign plays and to the old Italian repertory of 1900–25.

The drive against translations of foreign works, though relaxed toward pro-axis writers, grew increasingly stringent against democratic authors.

In Aug. 1942 the ministry of popular culture announced the outright suppression of 735 periodicals, the curtailment of 478 others and the elimination of half the periodicals for young people. The pretext was "the paper shortage" which, strangely enough, did not militate against the appearance of new all-out fascist publications. One of these, *Il Primato Italiano*, a bulky monthly intended "to alleviate the lack of books," featured in its first issue an essay by Mussolini on "Ancient Rome and its Seapower."

The sorry plight of Italian culture in 1942 was best epitomi by a tirade contained in the *Popolo d'Italia* of July 19 against refractory Italian intelligentsia: "The so-called 'representati men," wrote Mussolini's paper, "represent one thing alone: most complete lack of faith in the things they are called upon represent. They fail to understand, nay, they even abhor the v currents of culture, art, social opinion and technical developm which they are called upon to represent."

The novels of some importance which appeared during 1 included: T. Gallarati Scotti, *La Confessione di Flavio Dos* B. Tecchi, *La Vedova timida;* G. Comisso, *Un Inganno d'Amo* F. Rusconi, *Calice d'Oro;* M. Gallian, *Gente di Squadra;* Corra, *Laura svegliati;* R. Bacchelli, *La Fine d'Atlantide, Il E gante di Tacca del Lupo;* R. Calzini, *Lampeggia a Nord di Sa Elena.*

Among works of history and literary criticism were: U. Paoli, *Urbs Romana;* V. Varonini and G. Salocchi, *L'Appo dell'Italia alla Guerra dell'Asse*, vol. I; V. Vitale, *La Diploma Genovese;* R. Quazza, *La Diplomazia Gonzaghesca;* L. Giusso *Viandante e le Statue*, II series; P. Pancrazi, *Scrittori d'Og* A. Savinio, *Narrate, Uomini, la vostra Storia.*

Most noteworthy among the works of Italian writers in e were: *The Principles of Power* by G. Ferrero, who died in Gen on Aug. 4; *Les Guerres Modernes et la Pensée Catholique* Don L. Sturzo; *The Seed Beneath the Snow* by I. Silone; *Quaderni Italiani* (New York) a series of studies on Italian pr lems. (M. F. C.

Italian Somaliland: *see* ITALIAN COLONIAL EMPIRE.

Italy. A kingdom consisting mainly of the peninsula project south into the Mediterranean from the mass of cent Europe. The land boundaries, which reach as far north 46°40′, are formed by France, Switzerland, Germany and Yu slavia. Capital, Rome. Ruler: King Victor Emmanuel I chief of government (il duce): Benito Mussolini (*q.v.*). tional flag: green, white and red in vertical stripes, with arms in the white stripe.

Area and Population.—Excluding Libya: area, 119,764 sq. pop. (est. Jan. 1, 1940), 44,815,000. Chief cities (pop. 193 Rome (1,155,722), Milan (1,115,848), Naples (865,913), Ge (634,646), Turin (629,115). Language, Italian; religion, Ro Catholic.

History.—The year 1942 opened with Italian defeats concluded with Italian disasters. As the year commenced, British advance in Libya continued and the besieged Italians the Egyptian border at Halfaya pass had surrendered. As ar closed, gloom covered Italy; its armies in North Africa had lted away; its contingents in Russia were being hammered mercifully by Stalin's troops; its industrial cities lay in ruins; d its independence had virtually become a farce as more and re German troops were rushed to defend it against the United tions.

From the end of Jan. 1942, however, until late October a rage of victory caused Italian hearts to brighten. Erwin mmel, the German general commanding the joint Italian-rman forces, emerging from his lair at Agedabia, recaptured ngasi from the British on Jan. 29, and in June swept them k all the way to the Egyptian border. Whereupon, compling the surrender of Tobruk, by midsummer he was deep in ypt itself, advancing to El Alamein, within 70 mi. of Alexandria. ce the Italians served under him, they might be considered torious in Africa; but the real fighting was done by the Gerns and not by the Italians. Mussolini, to be sure, visited ya in June, intent, it was said, upon entering Cairo in triumph; the allied line held firm and the duce returned discomfited Italy. Italian arms likewise met with temporary success in the raine and in the Caucasus in the summer. But the Italians l no stomach for fighting there, and on Oct. 20 a north Italian iment mutinied on being ordered to Russia. Willy-nilly, howr, Italian contingents were forced to join those of Hungary l Rumania in Hitler's second offensive in that country. And in there was the mirage of victory which melted away as ckly as it came when soviet Russia struck at its foes before lingrad in November and December (*see* WORLD WAR II).

Throughout 1942 the food situation deteriorated steadily, and lian morale weakened. From Germany cereals and coal were mised, but they failed to materialize; to Germany, on the er hand, went Italian fruit, vegetables, olive oil. The bread on was only half that of Germany and even less than in ne of the occupied countries, and the amount of spaghetti wed each individual was reduced to 12 oz. weekly. Italy, anwhile, was the only country in Europe in 1942 where there s industrial unemployment, for raw materials for manufacture ually were unobtainable.

As Italian morale declined, the nazi overlords tried to stiffen by strongarm methods, and the Americans endeavoured to ken it still further by holding out an olive branch to noncist Italy. In October Heinrich Himmler, chief of the dread tapo, visited Italy on a tour of inspection and subsequently uged that unhappy country with a new flood of gestapo agents. that same month the United States government announced t no longer were Italian-born immigrants to be considered my aliens but as good fighters for liberty and against fascism n announcement unfortunately somewhat neutralized by the . press and by radio propaganda praising the Croats, whom lians have always hated, and intimating that a democratic olution in Italy would not necessarily be a *sine qua non* for peace treaty with the Italian kingdom—this a dash of cold er on the underground movement for freedom in the penina.

The last three months of the year were dreary. Rommel's reat from Egypt commenced on Oct. 26 and from that day until last day of the year, the 8th British army continued to maul retreating Italian divisions. Deserted by Rommel, who paid attention to his allies in trying to save his own panzer divins, the Italians surrendered in droves to the British, and soon total number of Italians captured since the war began unted to 231,000 men (Mussolini's own figures). So anxious, leed, were Italian soldiers to surrender that they did so in ge numbers to unarmed British doctors and even to war corpondents. And then, beginning also in October, came a long series of raids on the industrial heart of Italy—the triangle composed of Turin, Milan and Genoa. The destruction wrought in Turin in 1942 by the R.A.F. far exceeded that wrought in London in 1940 by the luftwaffe, since the bombs dropped were much larger and the anti-aircraft defense was inferior. In Genoa, harbour facilities were ruined, and 1,000 ac. of city streets blotted out. Night after night the R.A.F. raiders made the 1,400-mi. round trip from England, and out of their ruined cities the population flocked incontinently. "And this is but the beginning," said Prime Minister Churchill in London, "of a prolonged, scientific and shattering air attack."

Mussolini, reputedly a very sick man, appeared at a special meeting of his National Council of Corporations and made answer. His reply reflected impotent rage. He promised that the Germans would supply Italy with anti-aircraft defense. As for Churchill, he, the duce, was more a gentleman than that man, "intoxicated with alcohol and tobacco."

The U.S. occupation of North Africa came as a final blow. It gave Italy an opportunity which it promptly seized to occupy Corsica and the French Riviera, an occupation which almost every intelligent Italian knew would be temporary. Meanwhile, U.S. bombers from North Africa began destroying Italian shipping in the harbour of Naples, and the Germans began demanding that Italy hand over its defense to their skilled keeping. Italy could not even sue for peace if it so desired; the nazis would not permit it that option.

Education.—Public elementary schools in 1937–38, 131,580; pupils, 5,411,596. Students in secondary schools, 647,505; in universities, 77,429. A special school charter of 1939 required all education in Italy to have a fascist stamp.

Defense.—In 1939 (estimated): army, 900,000; planes, 5,500; battleships, 6; cruisers, 22; destroyers, 61; torpedo boats, 71; submarines, 105.

Finance.—Estimates for year ending June 30, 1940: revenue, 24,560,000,000 lire; expenditure, 29,316,000,000 lire. Lira quoted Dec. 1939 at 5 cents; in June 1941, 5.262 cents.

Trade and Communication.—In 1939: imports, 11,061,000,000 lire; exports, 8,007,000,000 lire. Railway, 29,220 km. Shipping: 2,301 sailing vessels, 1,057 steamships, 293 motorships. Total over 2,000,000 metric tons.

Agriculture, Manufacture and Minerals.—Livestock in 1938: horses, 791,120; asses, 791,390; mules, 431,150; cattle, 7,666,890; pigs, 2,940,440; sheep, 9,467,400; goats, 1,828,070. In thousand quintals: wheat, 12,420,000; maize, 3,724,000; beans, 1,625,000; olives, 2,038,000.

Most important industry, textiles, with 938 factories in 1938. In minerals, sulphur continued to lead, there being mined, in 1938, 2,363,000 metric tons, to 930,000 tons of iron pyrites, next competing mineral. Jackson, William Henry (1843–1942), U.S. photographer, artist, writer and explorer, was born April 4 in Keeseville, N.Y. From his father, an amateur daguerreotypist, he learned the mechanics of photography and got his first job in a "portrait gallery" in 1857. He travelled westward in 1866, photographing scenes of the construction of the Union Pacific railroad, of Indians and frontiersmen in the Wyoming territory. He became official photographer of the U.S. Geological Survey of the Territories in 1870. He was the first to photograph the Yellowstone region before it became a national park and made some of the earliest pictures of the lofty Colorado peaks. Jackson moved to Washington in 1924 to devote himself to painting and writing, and in 1935 he was commissioned by the department of the interior to do a series of murals for its new building in the capital. He wrote *Time Exposure,* an autobiography, in 1940. He died in New York city, June 30.

Jamaica: *see* WEST INDIES, BRITISH.

James, William Roderick (1892–1942), U.S. author, and illustrator, was born June 6 in a covered wagon in Judith Basin, Mont., while his parents were on the trail. Orphaned at four, he was adopted by a French-Canadian trapper and lived in Canada. When he was 13 he returned to Montana, where he became an expert bronchobuster at rodeos. An injury 15 years later ended his riding days and he took seriously to writing and to drawing horses, a hobby which he had cultivated assiduously since childhood. His illustrated articles and stories, written in the simple language of the cowhand, were popular. His book, *Smoky,* won the John Newbery medal for the most distinguished children's book of 1926. He also wrote *Cowboys, North and South* (1924), *The Drifting Cowboy* (1925), *Sand* (1929), *Lone Cowboy* (1930), *The Three Mustangeers* (1933), *Home Ranch* (1935), *Flint-Shears* (1938), *The Dark Horse* (1939), *Horses I've Known* (1939) and *The American Cowboy* (1942). He died in Hollywood, Calif., September 3.

Japan. An empire, consisting of a chain of islands in the western Pacific, stretching from South Sakhalin (Karafuto) (50° latitude) to the South Seas mandated islands, which extend over a great expanse of the Pacific, some being located near the equator. The Japanese empire includes Chosen (*q.v.*) on the mainland of Asia and the small Kwantung leased territory, with the city of Dairen, on the Liaotung peninsula. Chosen, Formosa (Taiwan) (*q.v.*) and South Sakhalin, together with the South Seas islands, are administered as colonies. The area of the Japanese empire is 263,359 sq.mi., of Japan proper (the four large islands, Honshu, Hokkaido, Shikoku and Kyushu, with many adjacent smaller islands) 148,756 sq.mi. Population of the empire (census of 1935) was 97,697,555, of Japan proper, 69,254,148. An estimate of the Cabinet Statistics bureau placed the population of the empire at 103,087,100 on Dec. 1, 1937. The same source estimated the population of Japan proper at 72,875,800, as of Oct. 1, 1939.

Capital, Tokyo (*q.v.*). Japan's six largest cities are Tokyo (pop. 5,875,667, census of 1935; 6,581,100, estimate of 1939); Osaka (pop. 2,989,874, census; 3,394,200, estimate), Nagoya (pop. 1,082,816, census; 1,249,100, estimate), Kyoto (pop. 1,080,593, census; 1,177,200, estimate), Kobe (912,179, census; 1,006,100, estimate) and Yokohama (704,290, census; 866,200, estimate). Buddhism is the most prevalent religion, followed by Shintoism, the indigenous faith of Japan. There were 41,127,307 Buddhists in Japan in 1936, 16,525,840 Shintoists, 215,166 Japanese Christians of Protestant denominations, 111,856 Roman Catholics and 41,251 Greek Orthodox believers in 1938. U.S. and British missionary work was necessarily suspended after the outbreak of hostilities, although some of the mission schools and hospitals continued to function under Japanese direction.

The Japanese sovereign is Emperor Hirohito. The premier, at the end of 1942, was Gen. Hideki Tojo.

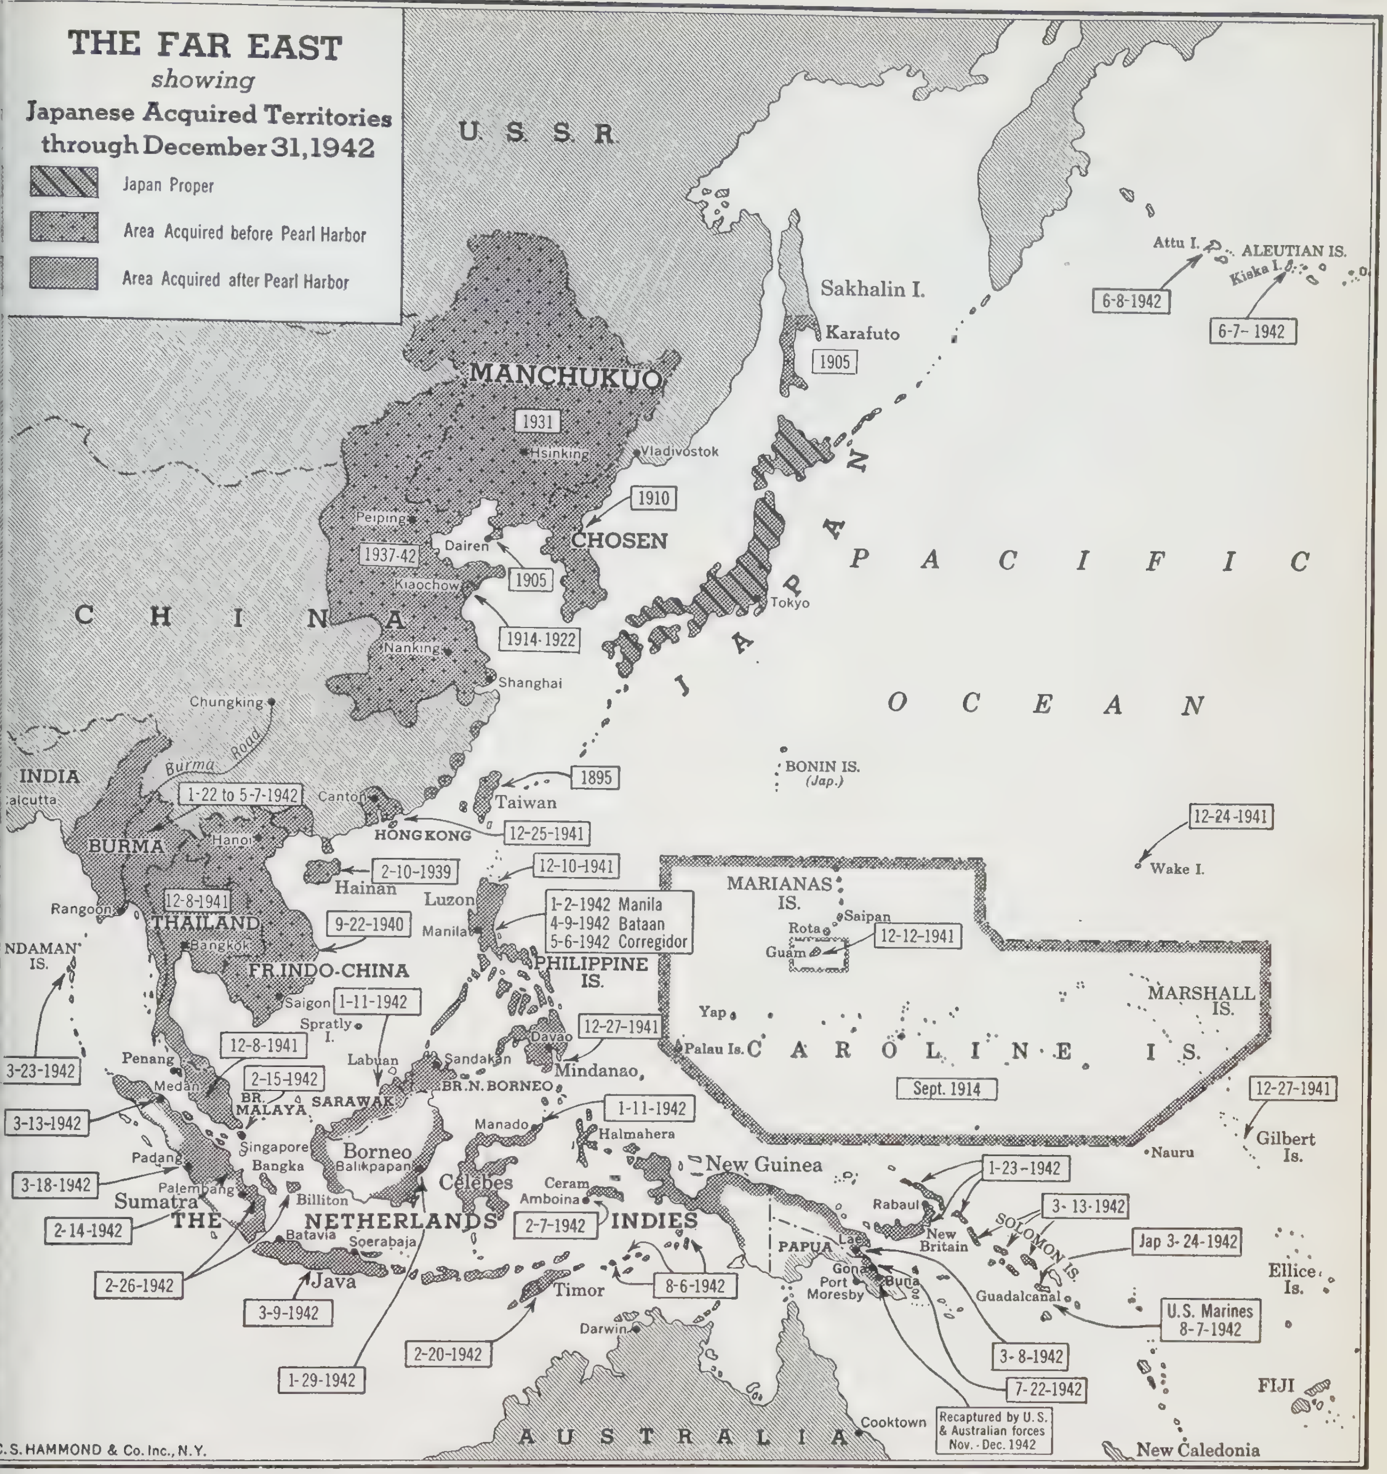
History.—The year 1942 ranked among the momentous y of Japanese history. The first few months were marked by unbroken series of Japanese victories, some of these paid for w substantial losses, but leading to Japanese control of an area more than 1,000,000 sq.mi., rich in tin, rubber, oil and other materials, in southeastern Asia and the archipelagos of the rounding seas. British and U.S. naval strength in the orient thus temporarily crippled, and the Japanese in the first mon of the war possessed very great air superiority. They also p sessed the advantage of a unified command, while the Un Nations forces, dispersed over a wide area, were not str or well equipped enough in any one place to make a succes stand.

One by one the bastions of western trade and empire fell the hands of the Japanese. The international settlement at Sha hai had been taken over without resistance as soon as the began. The British crown colony of Hongkong, held by a Bri and Canadian garrison, had been captured on Dec. 25, 1941, Japanese occupation, according to some eyewitness testimo being marked by a number of outrages against women, woun and prisoners. The capital of the Philippines was taken on Jan 1942. General Douglas MacArthur, commander in chief of U.S. and Filipino forces, retired into the fastnesses of the Bat peninsula. Under MacArthur and his successor, General Jonat M. Wainwright, appointed when MacArthur was transferred Australia to take over command of the United Nations forces that area, there was stubborn and prolonged defensive fightin Bataan. Inability to reinforce the forces on Bataan and to s ply them with munitions, food and medicines, together with Japanese superiority in men and equipment, brought about collapse of this resistance on April 9, 1942. The fortress of C regidor, commanding the entrance to the harbour of Manila, rendered on May 6. Organized military resistance in the Phi pines came to an end.

Meanwhile the Japanese forces were pressing on to new still more important conquests. A rapid sweep down the narr elongated Malay peninsula ended in the capture of Singap the great British naval base in the orient, on Feb. 15. A ga son of some 70,000 British, Australian and Indian troops rendered. The Japanese then moved on rapidly from Singap to the Netherlands Indies. Some points in the outlying isla of the archipelago had been captured in the first weeks of campaign. The decisive struggle for Java, centre of the Du defense preparations, took place in March. After a fierce na engagement in the Java sea and some brief land engagements, Japanese gained control of Java and the base of United Nat resistance shifted southward, to Australia. Later in the yea was announced from Tokyo that the last Dutch troops, w had been carrying on irregular warfare, had surrendered in Bor The blackout and curfew regulations in the Netherlands In were then suspended.

The last event in the period of rapid Japanese advance was overrunning of Burma, which took place in April and early M Besides giving the Japanese possession of one of the great producing countries of Asia, a land rich in oil, teakwood other natural resources, the occupation of Burma was a se blow to China. The Burma road, which had been China's p cipal artery of communication with the outside world after Japanese occupation of the main Chinese ports, was closed at source. Supplies to China could only be sent by air o the Himalayas and the other high mountains between C and India.

An official Japanese claim as regards the spoils of the first months of war, listed the following items: 342,000 war prison including 25,000 Americans; conquest of an area inhabited



6,670,000 people; 3,763 guns; 1,440 tanks; 31,859 motor cars; ,200 locomotives and freight cars; 240 planes; 11,548 heavy and ht machine guns; 216,714 rifles; 48 large ships and 299 smaller ssels.

The Japanese also claimed control of an annual production of 300,000 tons of petroleum, 760,000 tons of rubber, 110,000 tons tin, 5,000,000 tons of rice, 2,720,000 tons of sugar, 49,000 tons manganese and quantities of copper, bauxite, tungsten and her valuable raw materials. A Greater East Asia ministry was t up to exploit the conquered areas.

The high tide of Japanese success was perhaps reached in May, hen the conquest of southeastern Asia had been completed and e Japanese forces seemed poised for new springs at India, Australia and Siberia. After this there were no major victories in 1942, and some severe setbacks and defeats. The first important check which the Japanese forces sustained was in the battle of the Coral sea, in May, when a Japanese fleet, moving toward Australia, was defeated and turned back by U.S. and Australian naval and air units.

More serious for Japan's sea power was the repulse, with heavy losses in aircraft carriers, planes and cruisers, of a Japanese attack on Midway Island in a battle which occurred June 4–6. About the same time the Japanese obtained a foothold in the western Aleutians, following an air attack on Dutch Harbor. While subjected to periodic pounding by U.S. planes, Japanese forces remained in Kiska until the end of the year, abandoning some of

HAGGARD BRITISH AND U.S. PRISONERS at Woosung prison camp in occupied China, listening as a Japanese propaganda officer reads the news of the fall of Singapore Feb. 15, 1942. This picture appeared in an English-language magazine published by the Japanese in Shanghai

the smaller islands which had first been occupied.

U.S. bombers under the command of Gen. James Doolittle bombed Tokyo on April 18. Some of the fliers were forced to land in occupied China and were captured. There was no other air blow directed at Japan proper during 1942, although U.S. fliers, the so-called Flying Tigers, under the command of Gen. Claire Chennault, bombed Japanese installations in various occupied regions, such as Hongkong, the Kailan coal mining region of north China, Thailand and Indo-China.

A United Nations counteroffensive against Japan started on August 7, when U.S. marines landed in the southern Solomons. The most important immediate result of this move was the occupation of a new airfield which the Japanese had constructed on Guadalcanal. The Japanese made repeated but unsuccessful efforts to retake Guadalcanal, losing heavily in ships and planes in the process. The war also took an unfavourable turn for Japan in New Guinea. Early in the war the Japanese had occupied Lae and Salamaua, on the northern coast of the eastern part of New Guinea, an Australian mandated territory. Extending their occupation eastward to the Buna-Gona area in July, they subsequently launched an offensive across the Owen Stanley mountain range which at one time brought them close to Port Moresby, United Nations base on the southern coast. Then reinforcements arrived and U.S. and Australian troops, under the command of General MacArthur, pushed the Japanese back to their starting point; toward the end of December the Japanese were clinging to a narrow beachhead near Buna and apparently facing destruction or surrender.

So by the end of 1942 Japan, while still retaining a vast rich conquered colonial area, had lost its initial advantages of surprise and special preparation and was apparently feeling more and more the technical superiority of U.S. war production. There were wide discrepancies in estimates of Japanese losses. A Japanese official statement issued in December admitted 21,166 killed and 42,577 wounded up to Nov. 1, 1942, excluding losses in China, where the fighting was not very heavy and the military situation remained substantially unchanged during the year. U.S. intelligence officers estimated Japanese losses in all theatres during 1942 at 250,000 killed and disabled.

Internal Events.—There was no visible disturbance of internal stability in Japan during 1942. An election for the diet was held in the spring and was officially described as revealing full support for the government's policies. The political parties, in any case, had been pretty completely deflated in significance even before the outbreak of the war. The resignation of Foreign Minis Shigenori Togo in Sept. 1942 was interpreted as a possible prelu to a Japanese attack on the soviet union. But this attack, althou rumoured as impending several times during the year, did n take place.

An exchange of interned diplomats, journalists, missionari businessmen and other civilians was arranged between the Unit States and Japan during the summer, and also covered America in occupied parts of China. A similar arrangement was work out for British and Canadians. The treatment of the persons terned varied widely; there were some cases of brutal maltre ment and imprisonment under hard and unhealthful conditio In other cases the foreigners were permitted to remain in th homes under mild surveillance. The principal offenders in reso ing to physical brutality were members of the gendarmery, military police.

Education.—There were 48,637 schools of all types in Jap in 1938, with 15,638,780 pupils. Elementary education is co pulsory between the ages of 6 and 14. There were 563 mid schools, with 364,486 students, and 45 universities, with 6, professors and 72,968 students. Governmental expenditure education in 1937–38 was 145,642,185 yen, while the educatio appropriations of local public bodies in the same year amoun to 487,069,482 yen.

Defense.—All estimates of the strength and disposition of Japanese armed forces were necessarily conjectural in 1942. T Japanese army is based on the principle of conscription on a t ritorial basis, copied in many details from the pre-1914 Germ army. There is liability to service between the ages of 17 and Japan in 1942 probably had about 80 divisions, strung out ove very wide area, from the northern frontier of Manchuria to N Guinea, the Solomons and Burma. There were supposed to be tank regiments, with 150 tanks apiece; the full mobiliza strength of the island empire was in the neighbourhood of 2,5 000 to 3,000,000.

The Japanese navy at the outbreak of the war was believed have consisted of 10 battleships, 8 to 9 aircraft carriers, 35 to cruisers, 108 to 126 destroyers, 69 to 80 submarines and a p portionate number of torpedo boats and auxiliary craft. Tow the end of 1942, Japanese official sources admitted the loss of warships, including a battleship and three aircraft carriers, a the damaging of 22 others, including one battleship and two a craft carriers. United Nations claims were that during this per 129 Japanese warships, including two battleships and six aircr carriers, were sunk. At the same time Captain Hideo Hira official spokesman for the Japanese navy, declared that "a c tain number of powerful battleships," together with "aircraft c rs of unique construction" had been put into service since the ginning of the war. The personnel of the Japanese navy was re than 300,000.

Finance.—The unit of currency is the yen (officially valued 23.48 U.S. cents at the time of the outbreak of the war in the cific). The budget for 1942–43 called for expenditures of 30,- ,000,000 yen, with revenue receipts estimated at only 8,000,- ,000 yen. This represented a tremendous forward leap from budget of 1941–42, set at 13,875,000,000 yen, of which 7,574,- ,000 yen was to be raised by borrowing. The severity of this ancial strain could be gauged from the fact that Finance Min- r Okinori Kaya estimated the Japanese national income in 2 at 45,000,000,000 yen. The national debt was 41,123,670,- yen on April 30, 1942 and was, of course, increasing at an remely rapid rate. Currency in circulation on Sept. 30, 1941: 19,000,000 yen.

he Bank of Japan is the central bank of note issue. The kohama Specie bank is in charge of foreign exchange trans- ions and finances foreign trade. Commercial banking is mostly he hands of seven large banks, which are closely tied in with industrial companies and commercial undertakings: the Mitsui, tsubishi, Daiichi, Sumitomo, Yasuda, Dai Hyaku and Sanwa.

rade and Communication.—Trade figures for Japan proper cluding its colonies) were as follows:

	1939 (yen)	1940 (yen)
orts	2,917,000,000	3,709,035,000
orts	3,576,000,000	3,972,400,000

ublication of detailed trade figures ceased in 1940. A tendency Japanese trade up to that time had been to develop a surplus exports to Manchuria and occupied China, while sustaining a cit in trade with countries outside the so-called yen bloc. retaliatory economic measures applied by the United States, at Britain and the Netherlands Indies after the Japanese occu- ion of southern Indo-China in July 1941 cut off Japan's trade h almost all countries except those which were under her itical control. The danger of seeing its reserves of oil and other tegic raw materials exhausted was undoubtedly a strong mo- impelling the Japanese southward drive which began with the ck on Pearl Harbor. Both Japan proper and the countries of yen bloc are deficient in oil.

rade in any real sense of the term ceased altogether, except some limited exchange of goods with the soviet union and h exchanges with the axis powers as might run the United tions blockade when Japan launched its war against the west- powers in Dec. 1941. From that moment Japan was almost irely dependent on the products which could be extracted from itory already under its control, or which it might conquer.

here were 27,294 km. of state and private railways in Japan 938 besides 5,206 km. in Chosen, 3,470 in Formosa and 342.9 South Sakhalin. An important link in the Japanese railway munication system was added with the completion in 1942 of undersea tunnel between Shimonoseki, in Honshu, and Moji, Kyushu. This made it possible to transport troops and freight hout transshipment across the narrow Kwannon strait and was tep long advocated by the army on military grounds. At the of 1939, Japan possessed 4,084 ships of over 100 tons, the regate tonnage being 5,728,779 tons. The number of sailing s, as of Sept. 30, 1938, was 17,791, with a tonnage of 1,046,- . The United Nations claimed to have sunk 265 Japanese rchant ships during the first year of the war, while the Japanese nitted the loss of 65.

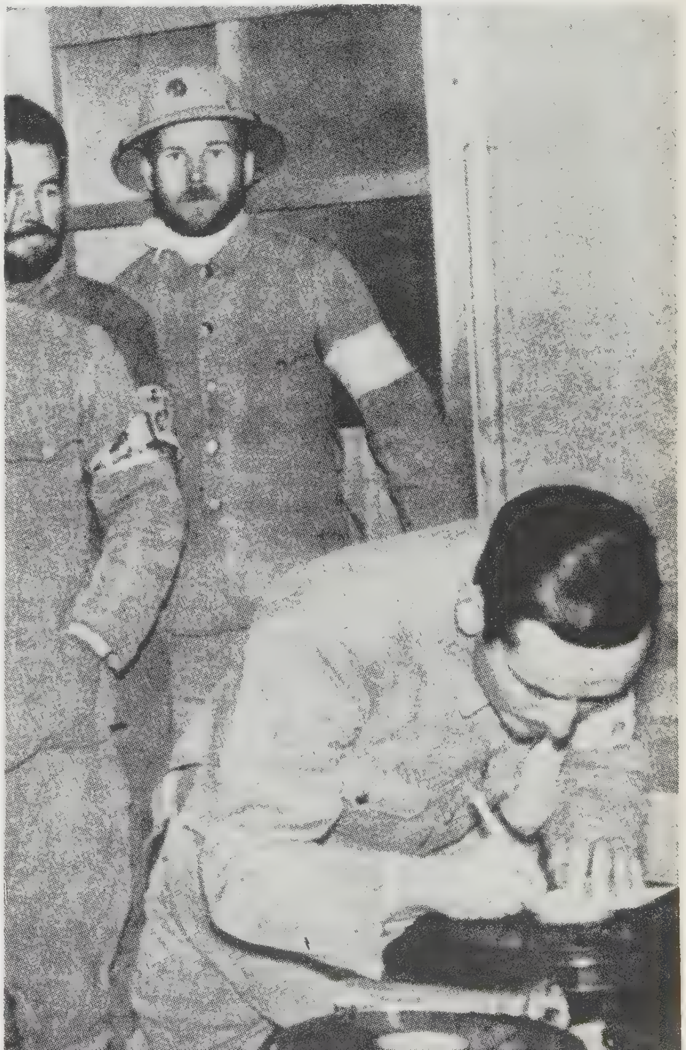
ommercial aviation is centralized in the hands of a semigov- mental monopoly, the Japan Airways company, which was blished in 1939 with a capitalization of 100,000,000 yen. The gth of its routes in 1938–39 was about 10,000 mi. The number of flights was 17,144, the aggregate length of flights 6,209,873 km., the number of passengers carried 69,268, the quantity of goods conveyed 297,807 kg., the amount of mail carried 819,261 kg.

There were 13,648 telegraph stations in Japan proper in 1939, and 75,838,875 domestic and 1,261,295 foreign messages were handled in the year 1938–39. The length of the inland telegraph lines was 425,752 km. in 1938. There were 6,197 telephone exchanges in Japan on Sept. 30, 1939, and 1,006,498 subscribers to telephone service.

Agriculture.—There were 5,519,480 farm households in Japan in 1938, and the amount of land under cultivation was about 15,000,000 ac. There was a slight decline in the number of farm households, extending over several years; the cultivated area showed very little change. Rice is Japan's largest crop and represented about half the reported value of Japan's agricultural produce in 1939. (The total reported value, excluding meat, milk and eggs, on which no data were given and which do not figure very largely in Japanese agriculture, was 5,614,000,000 yen. The value of rice produced in that year was 2,874,000,000 yen.) Silk is a secondary agricultural product, and has always been one of Japan's staple exports, although it suffered from a severe price recession during the '30s until the outbreak of World War II. The value of silk cocoons produced in 1939 was 883,000,000 yen.

Livestock plays little role in Japanese agriculture; there were 1,894,261 cattle, 1,140,479 swine, 114,000 sheep and 281,741 goats in Japan in 1938. In 1936 there were 1,431,920 horses.

U.S. MARINES at a Japanese prison camp recording their names and messages to relatives on phonograph disks which they then sign. According to the Japs, who released this picture in 1942, the records are broadcast over radio stations, apparently beamed for U.S. listeners



Agricultural Production in Japan, 1940

	Cultivated area (hectares)	Yield (metric tons)
Rice	3,173,234	9,071,313
Wheat	841,305	1,311,422
Barley	340,462	752,525
Rye	404,696	626,234

Manufacturing.—There were 112,332 factories employing more than five persons each in Japan in 1938, with 3,604,283 workers and an output valued at 19,667,219,686 yen in 1938, the last year for which detailed figures were available in 1942. This was an increase of almost 20% over the value of production in 1937 and reflected the stimulation of the war with China. The most important industries, and the value of their output in 1938 were as follows: metal (4,687,166,000 yen); spinning and weaving (3,984,829,000 yen); machine and tools (3,821,881,000 yen); chemicals (3,460,581,000 yen); foodstuffs (1,786,275,000 yen). There were 1,442,713 persons engaged in the fishing industry in 1938. There was a tendency in later years to push up the production of "producers' goods," while cutting down the output of consumers' goods—a Japanese version of "guns instead of butter."

Mineral Production.—Japan is a poor country in natural resources. Its principal minerals are coal (41,803,000 tons, valued at 305,537,000 yen); gold (22,235 kg.; value, 74,828,000 yen); copper (77,973,000 kg.; value, 66,617,000 yen). These figures are for 1936, since the publication of statistics of mineral output after that year was forbidden. There have been experiments with extracting oil from shale in Manchuria and with manufacturing oil from coal in South Sakhalin. (*See* also COMMUNISM; FASCISM; UNITED STATES; WORLD WAR II.)

Jeffers, William M.

(1876–), U.S. railroad executive, was born Jan. 2 in North Platte, Neb. He started work with the Union Pacific railroad in 1890 as an office boy. He was then telegrapher, clerk, dispatcher, trainmaster, superintendent and vice-president and, by Oct. 1937, president of the road. On Sept. 15, 1942, Donald Nelson, WPB chairman, made Jeffers head of the rubber administration and gave him the task of executing the Baruch committee's proposals for tire conservation, gasoline rationing and expansion of synthetic rubber production. Ten days after he took over, he ordered nation-wide gas rationing to save tires, which became effective Dec. 1. Although there was sectional criticism of gasoline rationing, particularly in the middle west, Jeffers held steadfastly to his course; he warned, in a statement before the military affairs committee on Dec. 4, 1942, that the supply of crude and synthetic rubber would be down to the "absolute dangerous deadline of 120,000 tons" by the fall of 1943. Lack of machine tools for synthetic production, rather than lack of raw materials, was responsible for this situation, he declared. Later that month, Jeffers revealed that the government would open its first synthetic rubber plant, with an expected capacity of 80,000 tons yearly, in Jan. 1943.

Jewish Religious Life.

Until 1942, the campaign by the nazis to eradicate Judaism took the form of expropriating synagogues or dynamiting or burni them. Jewish libraries were plundered. Jewish schools and ins tutions of higher learning were closed and scattered to the win Jewish publications were suppressed. Jewish religious commu ties were dissolved. Rabbis and other Jewish religious lead were tortured and murdered. With characteristic thoroughness t nazi regime ruthlessly carried out its avowed policy of the an hilation of Judaism from the Atlantic shores of western Euro to the easternmost battleline in Russia. To this tragedy the ye 1942 added a new and paralyzing horror by putting into eff Hitler's oft-repeated intention to eradicate not only Judaism b also the Jewish people from Europe. By the end of 1942 the m hands of the nazis had wiped out in Europe 2,000,000 Jewish m women and children.

Beside this atrocity, unparalleled in all history, other aspe of the story of Jewish religious life in 1942 paled into insign cance. When the incredible facts became so clearly authenticat and attested that they could no longer be doubted, the f Jewries of both hemispheres gave themselves over to a solem day of fasting. Some comfort was found in the forthright sta taken in the declaration of the United Nations. In his messa for the Jewish New Year President Roosevelt declared that th "shall be no compromise in the struggle against hate, intoleran or bigotry." Similar ringing words were spoken by Christian and religious leaders in the free countries of the world, and country after country the clergy in pastoral letters and brave dividual utterances spoke out in horrified protest against the b barous massacres of Jews and the obliteration of Judaism fr the spiritual tradition of civilized Europe. The Vatican itself a proached Gen. Pétain in an attempt to intervene in France, b without success.

Outside of the shambles of Europe, Jewish religious life no certain elements of added strength. The dispersion of refug brought to established communities new religious strength of m tested and steeled in the flame of suffering. Refugees from E rope were organizing communities and synagogues in such te tories as Kenya, Northern Rhodesia, Nyasaland, Tanganyika a points in Latin America. The recognition of the organic ident of anti-Judaism with some of the worst aspects of naziism w reflected in government indictments of the forces of anti-Judai Protestant, Catholic and Jewish leaders in the United Sta jointly issued a declaration of the fundamental religious prin ples which they share in common. In Russia there was a mark subsidence of militant godlessness. For the first time in ma years synagogue services and other open observances of Judai were allowed without restraint. The armies of the United N tions furnished innumerable instances of Judeo-Christian int faith co-operation by chaplains. In general, the intimate comra ship of army life created a new religious understanding betw men of all faiths, and the world over, among Jewish men as w as those of other denominations, the stark realities faced by m in the armed forces awakened new depths of religious experien which might in the future give sorely needed strength to gri ously wounded Jewry. (*See* also ANTI-SEMITISM.)

Jewish Welfare Board.

The Jewish Welfare board w formed on April 9, 1917, to p vide for the religious, spiritual and welfare needs of the Jew men in the military forces of the United States. It continued t work with a greatly expanded program. The board is a mem organization of the United Service Organizations, Inc. (U.S.C The board also continued its services to veterans of World Wa and their families. It initiated and carried on services to mbers of the Civilian Conservation corps. In all its welfare ivities for men in uniform, the board has the co-operation of national Jewish organizations comprising the leading religious, tural, fraternal, women's, veteran and educational groups, all which are affiliated with the board. The board employed, in 42, 210 full-time workers, of whom 10 were stationed overseas. ere were also 22 part-time workers. This staff served at 508 ny and navy stations, 39 of which were at overseas points. The al program had the co-operation of 310 army and navy volun- r committees, of which 17 were outside continental United tes.

The board is also the parent body of 328 Jewish community tres in the United States and Canada. These organizations in 12 were in more than 225 cities, and had an aggregate member- p of 435,000 individuals at the beginning of 1942. Of these mbers, 260,000 were below the age of 26, and of them, 152,000 re between the ages of 13 and 25 inclusive.

With the advent of the war, the board instituted a war efforts vice, designed particularly to stimulate intelligent planning and ticipation in the war program of the nation. The department war efforts co-operated closely with government and quasi- ernment agencies in bringing their material and plans to the ention of the Jewish Center field.

n 1942, a women's division was formed to co-ordinate the rts of national and local women's groups in behalf of the gram of service to men in uniform and civilian war efforts.

The 1942 annual meeting of the board, commemorating the h anniversary of the organization, was held in New York city April 18, 19 and 20. The president of the board in 1942 was nk L. Weil. Walter Rothschild was chairman of its army and y committee, and Louis Kraft was the executive director. The ces of the board are located at 220 Fifth avenue, New York .

(F. L. W.)

nah, Mohammed Ali (1876–), Indian lawyer and politician, was educated at Kara- and in Great Britain. In 1906 he was advocate to the Bombay court; he served on the Imperial Legislative council and in 2 was re-elected president of the Moslem league. In this acity he pressed with energy and outspokenness the views of league, claiming to represent 100,000,000 Muslims, on the ure government of India. He had discussions with Sir Stafford ops, Gen. Archibald Wavell, Gen. Chiang Kai-shek, C. Raja- alachari and the Sikh leaders, and it clearly emerged that Moslem league's policy was one of uncompromising insistence Pakistan (the setting up of a separate Muslim state). He ed the British government not to be stampeded into a consti- onal change prejudicial to the Muslim demand for Pakistan, stated also that the solution of the constitutional problem ad- ced by Sir Tej Bahadur Sapru (*q.v.*) could not be accepted the Muslims, that no other solution could be adopted without r consent, and that if the British government permitted a du overlordship, it would "lead to the gravest disaster for ia."

hns Hopkins University. An institution of higher education at Baltimore, Md.; sident, Isaiah Bowman. In June 1942 the university intro- ed an accelerated program of study in the school of medicine, school of engineering, the college of arts and sciences and the nce departments of the school of higher studies, to prepare more speedily for the armed services and war industries. ler the new schedule students would obtain the bachelor's ree in two and two-thirds years instead of the conventional . The university carried on an intensified program of war training and war research in spite of heavy faculty losses due to the demands of the armed services and other governmental agencies. As an active participant in the research program of the Office of Scientific Research and Development, Hopkins undertook some 40 separate research projects in 1942 under contracts involving several millions of dollars. The Engineering Science Management War Training program prepared approximately 2,500 men and women for positions or promotions in war industries. For statistics of enrolment, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.

(I. Bo.)

Johnson, Hugh Samuel (1882–1942), U.S. soldier, lawyer, government official and newspaper columnist, was born August 5 in Fort Scott, Kan. He ran away to join the army when he was 15, but was brought back home by his father and sent to West Point. He was graduated from the U.S. military academy in 1903 and served in the Philippines, 1907–09. On returning to the United States, he studied law and went along as judge advocate with Pershing's forces during the Mexican campaign of 1916. During World War I, he helped organize and establish the machinery for the draft law and also served on the war industries board. Johnson, who was a brigadier general when the war ended, resigned in 1919, and entered private business. He was president of an automobile carpet company in 1933, when President Roosevelt called him to administer the National Industrial Recovery act. Gen. Johnson was given wide authority to operate the machinery intended to guide business in the national recovery program. He resigned a little over a year later when the NRA was reorganized. He then became a newspaper columnist for the Scripps-Howard chain and displayed the talent for blunt language and colourful invective that earned him the nickname of "Old Ironpants." At first, Johnson defended the New Deal against the "tories." Later, he bitterly attacked the Roosevelt administration and its "radical" trend. Johnson died in Washington, D.C., April 15.

Jones, Jesse Holman (1874–), U.S. secretary of commerce, was born in Robertson county, Tenn., on April 5. At Dallas, Tex., in 1895 he became manager of a lumber company and seven years later organized his own firm. He engaged in extensive real estate operations and bought control of the Houston *Chronicle,* of which he is publisher. President Hoover appointed him a director of the Reconstruction Finance corporation in 1932 and he became chairman the following year. In July 1939 Jones was appointed administrator of the Federal Loan agency. On Sept. 13, 1940 President Roosevelt nominated him secretary of commerce to succeed Harry L. Hopkins, after congress had enacted a special law permitting Jones to retain the office of federal loan administrator. In the defense program of 1940 and 1941, Jones held an all-important position, since it was through the Federal Loan agency and RFC that most of the additions to plants and industries working on defense orders were financed. On March 24, 1942, William L. Batt, official of the War Production board, testified before a senate committee that Jones in 1940 had overruled proposals to expand U.S. synthetic rubber production. Jones later denied this assertion, and on July 15 said that the U.S. had ample rubber stocks for 1942 and 1943, but warned against tire wastage. He was named to the Economic Stabilization board in Oct. 1942.

Joseph Ferdinand, ARCHDUKE (1872–1942), son of the Grand Duke Ferdinand IV of Tuscany and Princess Alice of Bourbon Parme, was born May 24 in Salzburg. Head of the Tuscany branch of the Habsburg royal family, he served as a colonel general in the Austro-Hungarian army in World War I. He succeeded Gen. Moritz Ritter von Auffenberg-Komarow as commander of the Austrian 4th army in 1915 and became commander of the air force in 1917. He married Rosa Jockl, a commoner, in 1921. He later divorced Frau Jockl and in 1928 married Gertrude Tomanek, by whom he had two children, a daughter and a son. Shortly after Hitler annexed Austria in 1938, Archduke Joseph Ferdinand was arrested by the nazis in Mondsee. His activities thereafter were not reported. His death was reported in a Vienna dispatch of August 28.

Jute. Shortage of burlap bags continued acute in the western hemisphere in 1942 because of greatly reduced shipments from India. At one time in the summer of 1942 the market in Calcutta, centre of the Indian jute industry, suspended operations. In the United States, the War Production board made it an offense to mutilate bags and ordered that "no person shall sample the contents of a bag except by opening the seam or closure." Probes or triers were permitted in sampling if their use did not injure the fabric. The Office of Agricultural Defense Relations, in co-operation with a large U.S. bag manufacturer, distributed to potato growers and mills instructions on prolonging the life of bags. The government allotted sufficient cotton goods which, with paper bags, were substituted for burlap bags. Some concern was voiced in Cuba lest the shortage of burlap interfere with marketing the sugar crop. Trade reports late in 1942 indicated that sufficient bags had been received to handle the sugar production. It was reported in Dec. 1942, that the Indian government was lending £1,500,000 to the Bengal government for relief of jute growers in the province because of a large surplus and low prices. The 1942–43 production was reported as 9,014,130 bales compared with 5,422,500 bales in 1941–42. Production, it was estimated, might create a surplus of 2,000,000 bales over domestic consumption and export sales and add further to the accumulating carry-overs from 1940 and 1939. (S. O. R.)

Juvenile Delinquency. Statistical evidence was not available throughout the United States, but juvenile offenses seemed to have increased since the beginning of the war, while adult male offenses decreased. The increase of juvenile delinquency and young women offenders seemed to follow the pattern of World War I. Adults were drawn into the armed forces and war industries. Children were denied stable home life and in a general social restlessness which excluded their participation they committed petty delinquencies. Thus, as Plant explained, the delinquent is the sensitive indicator of the pressures put upon children by current ways of life.

Sex offenses accounted for an increase in the delinquent girl population in the majority of state correctional institutions, an increase amounting to 20% in some states. The task of social workers was to maintain touch with broken families and unprotected adolescents. The federal social security established a protective service to co-operate with state boards of health, local law enforcement agencies and private social agencies to deal with cases of migratory youth, especially girls.

The higher courts of Illinois, New Jersey and Virginia gave decisions upholding the conviction in criminal courts of children of juvenile court age. This was a trend in conflict with the law and practice of the majority of courts after 1898, when the principle of *parens patriae* was affirmed as a child-saving meas Official and uniform reporting of juvenile delinquency was u upon all courts by the federal children's bureau. However, c about 38% of the population of the United States were in reporting area (375 courts in all, representing 27 states and District of Columbia). Approximately 80,000 cases were posed of, white children being involved in 78%; Negro chil in 22%: children of other races less than 1%. (*See* also Cri

PSYCHOLOGIST of the Child Study institute at Toledo, Ohio, interviewin young Negro inmate. The institute's scientific methods decreased juvenile linquency in Toledo during 1942 at a time when the rate was increasing an estimated 20% nationally. The number of "repeaters" fell 50%

(M. V. W

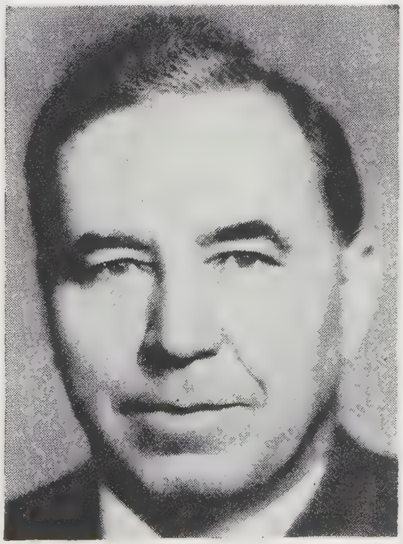
Kahn, Albert (1869–1942), U.S. architect, was born M 21 in Rhaunen, Ger., and emigrated to United States with his family in 1881. His first job was a apprentice in an architect's firm. Impressed with the boy's ta an architect placed him with another firm where he spent 14 y learning his craft. During World War I, he built camps, w houses, airfields and hangars all over the country. After the he concentrated on construction of industrial plants. He credited with having designed some of the first belt-line facto which revolutionized U.S. economy by facilitating mass pro tion. He drew up plans for more than 1,000 factories and bu ings for Henry Ford alone, including the Ford Willow Run p regarded as one of the industrial marvels of the age. He also signed 127 buildings for General Motors and more than 500 tories in 125 cities of the soviet union under the first Five- plan. Outside the industrial field, he drafted plans for and su vised construction of scores of hospitals, university build shipyards and office buildings. He died in Detroit, Dec. 8.

Kaiser, Henry J. (1882–), U.S. construction ex was born May 9 in Canajoharie, After 16 years with road construction projects in Canada, fornia and Cuba, 1914–30, he entered the dam construction and by 1933, became head of Six Companies, Inc.—the orga tion that built Boulder and Parker dams. Kaiser, who was fa for completing construction jobs ahead of schedule, entered s building in Jan. 1941. In 1942, he obtained control of four yards on the west coast. He revolutionized shipbuilding by fabricating ship sections. By June 1942 it was said that iser's shipyards had been assigned one-third of the U.S. shipilding program. On Nov. 18, his yards in Vancouver, Wash., nched a 10,500-ton liberty ship in 3 days 23 hours and 40 utes. Kaiser startled the United States in June 1942 with a posal to convert nine shipyards building merchantmen to protion of giant air transports. He further stated that ten months r such a program was set in motion these yards would be ducing transport planes at a rate of 5,000 yearly. Although B Chairman Donald Nelson was impressed with the Kaiser eme, other authorities declared that such a program would di- essential materials needed for bomber construction. The B, however, was willing to try the proposal, and on Sept. 18, 2, Nelson authorized Kaiser to begin immediate construction hree flying cargo boats on an experimental basis for comple- in 25 months at an estimated cost of $18,000,000.

meroons: *see* British West Africa; French Colonial pire.

neko, Kentaro, Count (1853–1942), Japanese statesman, son of an old Samurai family, was luated from Harvard law school in 1878. He returned to yo to teach school, but before long began to take part in irs of state. He was appointed private secretary to Prince Ito during this period was sent on a mission to study the conitions of foreign countries. He was later instrumental in ting Japan's constitution. Count Kaneko served as chief secry of the House of Peers, vice-minister and minister for agriure and commerce, and minister of justice. He was a delegate he peace conference at Portsmouth, N.H., in 1905, which ed the Russo-Japanese conflict. A friend of President Theo- Roosevelt, Count Kaneko was an exponent of cordial relas with the United States. He voiced sharp disapproval of the nese exclusion clause in the U.S. immigration laws in 1924, was then reported to have said that "America is sending us ell." In the days just prior to the Japanese attack on Pearl bor, he pleaded for peaceable settlement of differences with United States. He died in Hayama, Japan, May 16.

nsas. A central state of the United States, admitted Jan. 29, 1861; popularly known as the "Sunflower state." l area, 82,276 sq.mi., of which 82,113 sq.mi. are land; pop. , 1,801,028, a dese of 79,971 or 4.3% 1930. In rank the us placed the state in comparison with in 1930. Capital, eka (67,833). The larger cities were sas City (121,458) Wichita (114,966). he state's population 1940, 753,941 were n or 41.9%; 96.3% white, 3.7% Negro, % foreign born.



ANDREW SCHOEPPEL, elected governor of Kansas on the Republican ticket Nov. 3, 1942

istory.—In the bien- election of 1942 the ublican party in Kan- won an overwhelming ory. The executive ers elected were: Andrew F. Schoeppel, Ness City, governor; J. C. Denious, Dodge City, lieutenant governor; Frank J. Ryan, secretary of state (ninth term and sixth consecutive term); George Robb, auditor, fourth term; Walter E. Wilson, treasurer, third term; A. B. Mitchell, attorney-general; George L. McClenny, superintendent of public instruction, third term; Charles F. Hobbs, commissioner of insurance, eighth term; William C. Austin, state printer, sixth consecutive term. Arthur Capper was elected United States senator for the fifth term. As a result of the reapportionment on the basis of the census of 1940, Kansas was reduced to six representatives in congress. Former Democratic governor and ex-New Deal cabinet member Harry Woodring proposed, Dec. 8, 1942, the formation of a new political party, an "agrarian party directly representative of . . . agriculture, and its ramifications . . ." and based on the restoration of state and individual rights.

In preparation for the legislature of 1943, the legislative council approved 31 measures for submission to that body for action, and urged that the federal government compensate the state for some $3,000,000 worth of land taken off the tax rolls by government purchase. The school code and the tax code were completed in the council and bills prepared. The tristate (Kansas-Colorado-Nebraska) compact governing the distribution of the waters of the Republican river was vetoed by President Roosevelt because of alleged infringement upon federal rights. A new compact, the third such agreement, was negotiated, and signature by the Kansas representatives was authorized by Governor Ratner Jan. 5, 1943.

Industrial development in agricultural Kansas as part of the war effort was probably the most remarkable aspect of the year, the state ranking third after California and New York in aircraft production.

Several air training centres were assigned to the state as well as munition and other industries.

Education.—Enrolment in the public elementary and secondary schools declined from 460,036 in 1930 to 365,970 in 1940 and the number of teachers from 19,141 to 18,944. The high school enrolment in 1940 was 111,953. In 1937 there were 83,001 pupils enrolled in one-teacher rural schools, reduced in 1939 to 69,335. During the school year 1941–42, 219 small school districts were closed and superior opportunity was provided. A total of 1,611 districts had thus closed over a period of 33 years, about five-sixths of them in the final decade.

Communications.—The state had 9,349 mi. of primary and 9,862 mi. of rural highways; 8,667 mi. of railroads and 342,277 telephones in 1939.

Banking and Finance.—As of June 29, 1940, there were 671 active banks, 181 of which were national, with total deposits of $407,500,000. Savings banks held $79,500,000 of deposits. The legislature in 1941 voted a budget of $19,106,794 for the biennium 1941–43, divided about equally between the two years.

Agriculture.—Kansas farmers produced the second largest crop on record in 1942, being exceeded only in the year 1931. Although the acreage in crops was decreased about 1.4%, the 1942 production was 21% higher than in 1941 and about 74% above the five-year average (1936–40). Crops and ranges were benefited by the subsoil moisture remaining from the exceptionally heavy rainfall of 1941 and were helped along by the above-normal rainfall of 1942. The wheat crop of 206,775,000 bu. was second only to that of 1931. The corn crop of 90,060,000 bu. was the largest since 1932, the hay crop larger than in any year since 1928, flax production the largest since 1891 and the soybean crop more than four times the production of any previous season. The wheat yield of 1942 was 19.5 bu. per acre and had been exceeded only twice in Kansas history, in 1882 and 1914, when the yield was 20 bu. Yields for the western half of the state exceeded all previous records in producing bread wheat for the war effort, while the eastern counties were far below average. The corn yield was 28.5 bu. per acre, the highest since 1915, when it was 31 bu. The Kansas winter wheat acreage seeded for harvest in 1943 was estimated in December at 10,449,000 ac. or 94% of the fall of 1941. This was 26% below the 10-year average (1930–39) seeded area of 14,045,000 ac. In the fall of 1942 Kansas seeded 28% of the total United States winter wheat acreage. The Dec. 1 condition of the winter wheat was 91% of normal compared with 88% a year earlier.

Manufacturing.—The total value of manufactures in 1939 was $464,353,506; wages paid were $36,928,000. The five principal industries were meat packing, petroleum refining, flour, chemicals and creamery butter, rated according to value of their products.

Mineral Production.—The total value of mineral production in Kansas in 1939 was $123,391,521 as compared with $129,675,438 in 1938. In 1941 and 1942 the petroleum industry was operating at top production to meet defense needs.

Principal Mineral Products of Kansas, 1939 and 1938

Mineral	Value, 1939	Value, 1938
Petroleum	$63,100,000	$72,100,000
Natural gas	29,356,000	27,485,000
Zinc	7,172,984	7,010,304
Cement	5,614,112	4,949,018
Coal	5,490,000	5,263,000
Stone	4,550,000	4,958,723

(J. C. Mn.)

Karnebeek, Herman Adriaan Van (1874–1942), Dutch statesman, was born August 21 at The Hague. He had been foreign minister, 1918–27, minister of state and commissioner governor of the province of South Holland. A report of his death came from London, April 2. See *Encyclopædia Britannica* for a biographical note.

Keitel, Wilhelm (1882–), German army officer, born Sept. 22, was a commander of artillery during World War I. On April 1, 1934, he was promoted to major general and the following year, when Germany introduced conscription, he took charge of the personnel section (*Wehrmachtsamt*) in the war ministry, and was thus connected to a certain extent with the reoccupation of the Rhineland in 1936, and with the dispatch of German reinforcements to Nationalist Spain. In Feb. 1938, during Hitler's "army purge" of Gen. von Blomberg and other conservative members of the high command, Gen. Keitel was appointed chief of the supreme command of the German armed forces. He thus directed operations against Poland, Norway, the Netherlands, Belgium, France and Britain in 1939 and 1940. On June 22, 1940, he signed the German-French armistice and on July 19 he was created field marshal by Adolf Hitler. In the various campaigns of 1941 and 1942 Keitel's name was not prominently mentioned, although he continued to direct operations of the German forces. Of the nazi high command triumvirate at the start of World War II—Brauchitsch, Halder and Keitel—the latter was the only one to survive Hitler's successive purges throughout the 1941–42 period.

Kenny Treatment: *see* Infantile Paralysis.

Kent, Duke of (Prince George Edward Alexander Edmund) (1902–1942), youngest brother of King George VI of England, was born December 20. He was trained at the Royal Naval college at Osborne and served eight years at sea, first as a midshipman then as a lieutenant, but left the service in 1929 because of his health. With his brother, Edward, then Prince of Wales, he made a 15,000-mi. good-will t of Canada in 1927 and an 18,000-mi. journey through So America in 1931. Alone, he toured South Africa. While travell in Europe in 1934, he met Princess Marina of Greece, and th engagement was announced in August of that year. Their m riage took place on Nov. 29, 1934, and for this occasion the t of Duke of Kent was revived and bestowed upon him. couple had three children: Prince Edward George Nicholas P rick, born Oct. 9, 1935; Princess Alexandra Helen Elizabeth C Christabel, born Dec. 25, 1936; and Prince Michael Geo Charles Franklin, born July 4, 1942, who was given the na Franklin in honour of President Franklin Delano Roosevelt. Oct. 1938, the Duke was named to succeed Lord Gowrie, gover general of Australia, but the outbreak of World War II preven his assuming the post. In July 1941, he inspected Canadian tra ing schools and visited President Roosevelt at Hyde Park. duke, who was an air commodore on the staff of the inspector g eral of the R.A.F., was killed in active service on August when his flying boat, bound for Iceland, crashed in North Sc land.

Kentucky. An east south central state of the United Sta admitted June 1, 1792, popularly known as "Blue Grass state". Area, 40,598 sq.mi., of which 489 sq.mi. c stitute a water area, the Ohio river being its northern bounda Pop. (1940) 2,845,627, of which 1,996,300 or 70.2% was r and 849,327 or 29.8% urban. Negroes constituted 214,031 7.5%; and 15,631 were of foreign birth. Capital, Frankfort (492); largest city, Louisville (319,077). Other cities: Coving (62,018); Lexington (49,304); Owensboro (30,245); Padu (33,765); Ashland (29,537). The U.S. census bureau estima that war and war industries reduced the population in 1942 2.5%, or 61,140.

History.—The general assembly convened Jan. 6, 1942, in ular session. It increased the penalties for prostitution; gran more leniency in paroling convicts during the war period; vote war emergency fund of $500,000 for the governor's use, and duced state holidays to three: July 4, Labour day, Christmas. a special session (March 10 to April 8) the various legislative tricts were rearranged, both state and federal. In the electio Nov. 3, 1942 all the congressmen were re-elected. Senator Al B. Chandler (Dem.) won by 216,958 votes to 175,081 for his ponent, R. J. Colbert. A commission published the Kentucky vised statutes (3,200 pages) replacing the Baldwin edition former years. The chief officers of the state in 1942 were K Johnson, governor; Rodes K. Myers, lieutenant governor; Ge G. Hatcher, secretary of state; Hugh Meredith, attorney gene E. E. Shannon, treasurer; and John R. Brooker, superinten of public instruction.

Education.—The elementary schools of the state in 1942 rolled 498,599 pupils; 716 high schools had 5,988 teachers 139,910 pupils. The total number of teachers in the public sch exceeded 19,000. The Teachers' Retirement pensions began t paid in 1942.

Public Welfare, Charities, Correction.—Public assista gradually consumed a larger amount of public funds. Old- pensions in 1941 amounted to $6,195,166; in 1942 to $6,517, The correctional institutions in 1942 were the La Grange refor tory (2,871 male inmates and 93 in the women's division); E ville penitentiary (1,458 inmates); and the reform school. Cou votes during the year increased the "dry" area of the state t counties, nearly 64% of the area, and 42% of the population.

Banking and Finance.—The general budget for 1942–43 $28,554,917; that of 1943–44, $28,774,207. The budget did include road and bridge projects separately maintained by

d sales of fuel. Sources of the general fund in the fiscal year 41 were: alcoholic beverage taxes, $7,802,272; income taxes om corporations and individuals, $5,382,671; property, $6,123,-o; excise taxes $7,385,858; licences of various sorts $1,767,287. ie motor and road revenues exceeded $19,400,000. In Dec. 42 Kentucky had a general surplus of $6,094,000.

There were 307 state banks and 94 national banks in 1942, with al deposits of $650,000,000.

Agriculture.—The leading agricultural crops for two years re reported as in Table I.

Manufacturing.—Ranked by value of output, the chief indus-es in 1939 were the following: tobacco products $91,362,000; n and steel $50,158,000; meat packing $22,312,000; petroleum ining $21,305,000; distilled liquors $20,401,000; flour and grain oducts $15,157,000. No others exceeded $15,000,000. A com-rison of all factories appears in Table II for 1937 and 1939.

Table II.—*Industries of Kentucky, 1937 and 1939*

Year	No. Estab.	Employees	Cost of Material	Sales Value
37	1,624	77,799	$323,001,000	$504,897,000
39	1,640	70,718	293,629,000	481,629,000

Mineral Production.—In 1941 there were 54,145,813 tons of l mined; the production of oil amounted to 4,854,587 bbl. tural gas was not reported officially. There were 161 fatal acci-nts in the coal mines in 1942. (E. T.)

nya: *see* British East Africa.

dnapping.

There were no marked trends in the annual record of kidnappings in the United States er the enactment of the federal act in 1932. As the subjoined ole shows, 1942 was marked by an increase in the reported es by comparison with 1940 and 1941, but still at a level that s not out of line with that of preceding years.

Kidnappings in the U.S., 1932-42

Year	Total Number Kidnappings	Number Wherein Ransom Demanded
32 (from June 22)	5	5
33	14	10
34	18	5
35	26	1
36	31	1
37	20	4
38	37	5
39	20	0
40	12	1
41	9	0
42	19	0

During the period covered by this table there were 474 kid-oping convictions in federal and state courts, resulting in 12 ith sentences, 44 life sentences and others totalling 5,206 years, nonths and 20 days. Nine kidnappers committed suicide, eight re killed, seven were murdered by their accomplices and two re lynched. Fines amounting to $34,270.80 were imposed on napppers during this eleven-year period.

s the year 1942 ended, nine cases were either awaiting prosecutive ac- n or were pending because the kidnappers were still at large.

n addition to the 19 cases occurring in 1942, prosecution was completed seven other cases originating in 1941.

rom June 22, 1932, the federal bureau of investigation handled 238 es of kidnapping and conspiracy to kidnap. All but two of these cases e solved.

Without question the most widely publicized criminal case of 1942 was the kidnapping, rape and murder of Helen and Margaret Lynch, aged respectively eight and seven years, at Bedford Village, New York. Edward Haight was indicted for the crime in September, and was convicted and sentenced in November. In near-by Pelham Village, Mrs. Kathryn Batchelder, nurse, was implicated in what was described as a kidnap hoax involving Nancy Joyce, and the sending of an extortion letter.

Other U.S. cases included Mrs. A. T. Lussier, who was held for kidnapping the Botsford infant in Waukegan, Ill., in November; W. H. Thompson (alias du Bois), sentenced in October for kidnapping V. Miller of San Francisco, Calif.; Edward S. Horton, held for robbing and kidnapping Mr. and Mrs. J. Smith at Cold Spring, New York, in July; and the kidnapping (and later release) of the driver of a liquor truck in Jersey City, N.J., in June. Charles Ross Heath was sentenced for the kidnap murder of Gloria Jean Nault. Louis Francone, an infant twin, was abducted in New York by an unidentified woman.

In March, at Ogden, Utah, Bill Baker and James Quillen were held for abducting Ira Gourley and James Giles in connection with a robbery, while in Detroit, Mich., H. G. Roels was sentenced for abducting a number of department store employees, also in the course of a robbery. In New York state, H. J. Elling and J. W. Bender were sentenced for the kidnapping, robbery and murder of Paul Skaritza.

Reminiscent of the John J. O'Connell, Jr., kidnapping in Albany, N.Y., in 1933, was the attempt by Harigan and Crowley to have their conviction for that crime set aside. The motion was denied.

In Havana, Cuba, Cesar Rodriguez was wounded and his nephew Evenicio Hurriz was killed, while fighting off three kidnappers. Maximo Del Llano was held for the crime in July.

Kidnappings in the far east, a common feature of past years, were notable by their absence. (*See* also Federal Bureau of Investigation.)

(Br. S.)

King, Ernest Joseph

(1878–), U.S. naval officer, was born Nov. 23 in Lorain, O. He left Annapolis to serve in the Spanish-American War, returning to the naval academy to graduate in 1901. During World War I he was assistant to the chief of staff of the commander in chief of the U.S. fleet. In 1933 he was promoted to rear admiral and he was vice-admiral in command of the fleet's aircraft battle force, 1938–39.

On Feb. 1, 1941, Adm. King was made commander of the Atlantic fleet and on Dec. 20, 1941, 13 days after the Japanese attack on U.S. possessions in the Pacific, he was designated commander in chief of the U.S. fleet, in what was apparently a shake-up in navy organization as well as personnel. In his new post, King outranked the chief of naval operations, and assumed supreme command of all U.S. naval operating forces in Atlantic, Pacific and Asiatic waters. King then became possessor of the two highest offices in the navy, March 9, 1942, when he succeeded Adm. Harold R. Stark as chief of naval operations and in addition retained his post as commander in chief of the U.S. fleet.

King, William Lyon Mackenzie

(1874–), Canadian politician, was born at Berlin (now Kitchener), Ont., Dec. 17. His grandfather, William Lyon Mackenzie, had been prominent in the struggle for political freedom in 1837. King entered parliament in 1908, became leader of the Federal Liberal party in 1919, and was returned to office as prime minister for the third time on Oct. 23, 1935. Shortly after Canada entered World War II, King's foes charged him with negligence and incompetence in handling the war effort. But the country did not support this view, and in March 1940 his party won a landslide election, adding 25 seats to its parliamentary majority. In Aug. 1940, when a nazi invasion of Britain appeared imminent, the Canadian prime minister and President Roosevelt agreed to set up a permanent joint board of defense to study common defense problems. The fruit of another parley with President Roosevelt on April 20, 1941, was a U.S.-Canada pact for co-operation in producing war materials for Britain.

On Dec. 29, 1941, his government decided to cancel the British war debt of $1,500,000,000 that had accumulated for the purchase of war munitions in Canada after 1939. In April 1942 King asked for a plebiscite for authority to send conscripted soldiers overseas for duty if necessary. He won an overwhelming majority, with only Quebec province and its predominantly French Catholic population voting against the proposal. He made several trips to Washington to attend sessions of the Pacific war council and was present at the Churchill-Roosevelt talks in June 1942.

Kiska: *see* ALASKA; WORLD WAR II.

Kiwanis International. Kiwanis International is an organization of men's service clubs in the United States and Canada. In 1942 there were 112,000 members in its 2,190 clubs.

The first Kiwanis club was organized in Detroit, Mich., Jan. 1915. In Canada, the first club was organized in Hamilton, Ont., Nov. 1916. Each club is made up of not more than two leaders from each business, professional and agricultural classification in a community. These men are brought together to give civic and social service to that community. The name "Kiwanis" is a coined word receiving its real meaning from the constructive, unselfish work of Kiwanians; the motto of the organization is "We build."

The general office in 1942 was at 520 N. Michigan avenue, Chicago, Ill. President (1942–43) was Fred G. McAlister, London, Ont., Canada; secretary O. E. Peterson, Chicago, Illinois.

(W. A. D.)

Kleist, Paul Ludwig von (1881–), German army officer, was born Aug. 8 in Braunfels, Prussia. Product of a German military school, he served as a lieutenant of hussars and regimental commander in World War I. After the armistice, he was a cavalry instructor in Hanover, but during Hitler's rule he was lifted from the obscurity of the classroom to command of an army corps. Kleist participated in successful operations in Poland, 1939, France, 1940, and led the mechanized column that took Belgrade in the Yugoslav campaign, 1941. Early in the Russian campaign, his tank army led the nazi attack on Kiev and the advance through the Ukraine. Kleist's armies also captured Dnepropetrovsk in Aug. 1941, but this proved a pyrrhic victory, since the Russians had destroyed the famous dam there before retiring. In Nov. 1941 Kleist's armies captured Rostov, only to lose it a week later when General Timoshenko launched a counter-offensive. When the nazis renewed their offensive in the summer of 1942, Kleist, then commander of the First German Tank army, drove to the foothills of the Caucasus near Mozdok before his advance was stopped by stiffened Russian resistance and winter snows.

Knabenshue, Paul (1883–1942), U.S. statesman, was born Oct. 31, in Toledo, O. He entered the U.S. consular service in 1906, serving as vice-consul in Belfast, Ireland. He was in Cairo as vice-consul and deputy consul general, 1911–1917, and was consul from 1917 to 1919. From Cairo he was sent to Beirut, Syria, where he served as consul, 1919–28, and as consul general, 1928. Knabenshue was consul general to Jerusalem, 1928–32; was appointed minister resident and consul general at Baghdad, 1932, and subsequently was named minister to Iraq. He died in Baghdad, Feb. 1.

Knickerbocker, Cholly: *see* PAUL, MAURY H. B.

Knights of Columbus. Organized in 1882, this fraternal order is dedicated to the preservation and the championship of Catholic and traditional U.S. principles. The traditional slogan of Columbianism, "For God and Country," received special emphasis after U.S. entry into World War II.

The total membership as of Aug. 1942 was 424,823. The ass ciate members numbered 206,442; insurance members 218,38 There were about 2,480 local councils in 48 states, U.S. terr tories and possessions, Canada and Latin America. The insu ance department in 1942 reported total assets of $52,448,863.5 total liabilities $46,592,666.81. The total income was $7,984 358.93, and total benefits paid by death claims and old age ben fits $3,147,610.39.

The 60th supreme convention was held Aug. 18–20, 1942, Memphis, Tenn.; 270 delegates from 272 state and regional juri dictions attended. A message was read from Cardinal Maglion papal secretary of state, conveying the benediction of Pope Pi XII on the 60th anniversary of the organization. The repo showed the greatest net increase in membership since 1921. Of cers re-elected for another term were: supreme knight, Franc P. Matthews; deputy supreme knight, John E. Swift; suprem secretary, Joseph F. Lamb; supreme advocate, Luke E. Har supreme chaplain, Rev. Leo M. Finn.

The order in 1942 eagerly met war conditions, as in World W I. It merged its activities with the National Catholic Communi service in behalf of the men of the army, the navy and the m rines. Members assisted in the sale of war bonds, in civilia defense works, in supplying blood banks through blood-don units. A National War Activities committee was set up, wi deputy supreme knight Swift as chairman. All jurisdiction national, state and local, gave fullest co-operation to the N tional Catholic Community service and the U.S.O. In Canada t councils acted as the direct agency of the Catholic hierarch in directing and operating the Knights of Columbus Canadia army huts.

In the field of youth guidance, the order for the 19th successi year continued its summer schools of boy leadership. The wo of the Columbian Squires, lads too young for membership, w carried on by a staff of trained workers who visited more th 400 councils during 1942. The Special Jubilee committee for t Vatican decided to erect in Rome a church in honour of St. E gene, to commemorate the 25th anniversary of the episcopal co secration of Pope Pius XII. The offer was accepted by the Po through the cardinal secretary of state.

National headquarters in 1942 were at New Haven, Con *Columbia,* a monthly illustrated magazine, and *News*, a week are the official publications.

(J. LAF.)

Knowlson, James S. (1883–), U.S. corporation o cial and industrialist, was born Ju 29 in Chicago. After graduating from Cornell university, 19 he was an electrical engineer in Schenectady, 1905–09. He w first chairman of the board and then president of Stewart-Warn corporation. In Sept. 1941 he was appointed deputy director the OPM priorities division as a dollar-a-year man. On Jan. 1942, he was named head of the WPB division of industrial op ations, with the task of speeding the conversion of U.S. factor to war production. When Chairman Donald Nelson realigned t WPB on July 10, 1942, the conversion problem had been solv and Knowlson was made vice-chairman on the WPB program termination staff. Two months later Ferdinand Eberstadt su ceeded Knowlson in this post; it was then explained that Kno son needed more time to devote to his increasingly heavy dut on the Anglo-American Combined Production and Resour board, of which he was a member. He was also chairman of t U.S. section of the U.S.-Canada joint war production committ an agency which had been set up to speed war production of b countries.

He retired from the latter post on Dec. 1, 1942, and resign as WPB vice-chairman early in Jan. 1943.

Knox, (William) Franklin (1874–), U.S. publisher, statesman and soldier, was born Jan. 1 at Boston and was educated at Alma (Mich.) college. He joined Theodore Roosevelt's Rough Riders, with whom he served from April to Sept. 1898. He was in France from May 1918 to Feb. 1919 and became colonel in the 365th field artillery. His newspaper career began shortly after his service in the Spanish-American war, when he was successively reporter, city editor and circulation manager of the Grand Rapids, Mich., *Herald.* From 1901 to 1912 he was publisher of the Sault Ste. Marie, Mich., *News,* and in 1913 he purchased control of the Manchester, N.H., *Union and Leader.* Later he became associated with the Hearst newspaper chain and was its general manager until 1931, when he became publisher of the *Chicago Daily News.* In 1936 Col. Knox was the Republican candidate for vice-president. On June 20, 1940, he was appointed secretary of the navy by Pres. Roosevelt.

In Oct. 1941, Secretary Knox, who had advocated immediate U.S. entry into the battle of the Atlantic, announced that U.S. convoys were enroute to Iceland. On Dec. 15, 1941, after an inspection of the damage at Pearl Harbor, Knox said one battleship, three destroyers, a target ship and a minelayer were lost in the attack because naval forces there were not on the alert. A year later, the navy revealed that eight battleships alone had been put out of action in the attack. Knox was ruthlessly criticized by his political foes for withholding the facts. His defenders, however, asserted that immediate revelation of the facts would have been of invaluable aid to the Japanese. In a review of the war on Dec. [illegible], 1942, Knox said that the U.S. navy was larger and more powerful than the day before Pearl Harbor and that Japanese casualties were five times those of the United States.

Knudsen, William Signius (1879–), U.S. industrialist, was born in Copenhagen, Denmark, on March 25 and as a youth worked in a bicycle shop in his native town. At the age of 20 he emigrated to the United States, where he found work in a shipyard in New York. After working in a railroad shop, he went to Buffalo, where he ultimately became superintendent of a mill. He then worked for Ford Motor company and became associated with Chevrolet Motor company, of which he was made vice-president in 1922 and later president. From 1933 to 1937 he was executive vice-president of General Motors corporation, and in the latter year he became president. On May 28, 1940 President Roosevelt appointed him commissioner of industrial production for the national defense advisory commission.

When President Roosevelt created the Office of Production Management Jan. 7, 1941, he named Knudsen director general. Knudsen continued to be the "top man" in the production phase of national defense until Jan. 1942, but gradually matters of general policy were delegated to other agencies such as the Office of Price Administration and the War Production board. In July 1941, Knudsen admitted friction with the OPA and Leon Henderson over the curtailment of motor car production. Knudsen had contended that an arbitrary reduction of 50% would dislocate U.S. economy. On Jan. 16, 1942, he was appointed production director of the war department and made a lieutenant general.

Kyanite. Shipments of kyanite from United States mines rose to 8,335 short tons in 1941, nearly double the 1940 output. At the same time, in spite of shortage of shipping space and rising freight costs, imports from India increased from 7,658 tons in 1940 to 6,211 tons in the first nine months of 1941.

Labour Party. The British Labour party continued during 1942 to be represented in the British government, C. R. Attlee and Ernest Bevin being members of the war cabinet where they were joined by Herbert Morrison in November, and Hugh Dalton, Thomas Johnston, A. V. Alexander and Sir William Jowitt occupying other important positions. Sir Stafford Cripps, also a member of the war cabinet from February to November, did not rejoin the Labour party after his expulsion, and counted as an Independent. Arthur Greenwood, on leaving the war cabinet, resumed his position as acting leader of the party in the House of Commons, and was re-elected to this position.

Total Labour party membership showed a slight decline during 1941. This was due to a sharp fall in individual membership, as affiliated trade union membership slightly increased. Individual membership fell from 304,000 at the end of 1940 to 227,000 a year later, male membership declining by 46,000. The main causes were the calling up of men for the armed forces and the migration of labour to new areas, which made organization difficult; and the suspension of party warfare also lessened political interest in the constituencies. Such by-elections as were contested were fought by independent candidates, including several of a "popular front" complexion who met with success. There was much discontent in the party over the electoral truce, and the party machine was criticized for filling vacant seats with elderly candidates.

The party conference in May 1942 approved the preliminary draft of a reconstruction program, which was later being amplified by a number of special committees. This program was in general an expression of moderate, evolutionary socialism. Later in the year, party opinion was much exercised over the Indian situation. While generally disposed to support the government on the basis of the Cripps offer, the main body of the party urged the keeping open of the door for renewed negotiations. In parliament the party pressed for an improvement in pay and allowances for the forces and their dependents, for the reorganization of the coal industry and for fuel rationing and for reforms to meet the position of pensioners, injured workmen receiving compensation and other special classes. It gave solid support to the war effort; but some sections went much farther than the party as a whole in criticizing the government, and especially in pressing for more complete public control of the war industries, more extensive rationing and further restrictions on luxury expenditure. There were misgivings within the party at the weakening of its electoral influence, which it shared with the other established parties, and at the growth of new socialistic movements outside its ranks. But the party leaders were disposed to regard such movements as mushroom growths. One notable feature of the year 1942 was the rapid growth of the Fabian society, which launched out through a socialist propaganda committee to form numerous local groups in order to reinforce and supplement the activities of the local Labour parties in the propagandist field. The Fabian society remained affiliated with the Labour party, which it helped to found 43 years ago. (*See* also CABINET MEMBERS.) (G. D. H. C.)

Labour Unions.

United States.—With the country at war in 1942 union activities during the year were concerned mainly with war problems and the operations of war agencies. The central issues of wages, the closed shop and the position of organized labour in the administration of the war, which were the cause of numerous and prolonged strikes in 1941, were on the whole settled amicably and with the co-operation of union leaders.

In arriving at a wage policy the paramount purpose of the government was to prevent the traditional war inflation of prices and wages. Although the unions began the year by demanding increases of $1 a day in the steel and automobile industries, the War Labor board, created by the president on Jan. 12 to replace the Defense Mediation board of 1941, held the demands under advisement until the president could announce the government's policy of wage and price stabilization. This announcement was made in a statement to congress on April 27. The burden of the statement was that wage increases, except in cases of gross inequalities or sub-standard wages, be kept in check in order to permit the administration to stabilize prices and the cost of living.

On July 15 the War Labor board issued the famous "little steel" decision. This decision embodied the first principle of wage determination which the board had seen fit to adopt. It provided that wages should maintain their purchasing power as of Jan. 1941. Since between that date and the middle of 1942 the cost of living had risen about 15%, the decision meant that the board would undertake to keep the total increases in wages granted within this period of 18 months from exceeding 15%. The steel workers, therefore, were awarded, instead of $1 a day or 12½ cents an hour, an increase of something more than 5 cents. The unions protested the decision, but finally accepted it. But, for exceptional cases, the "little steel" formula became the guiding principle of the year's wage settlements.

The troublesome issue of the closed shop was likewise settled by the board through a compromise between the position of unions and the employers. Following John Lewis's success fight for the closed shop in the bituminous coal industry, ganized labour generally pressed for the same concession a supported its demand by arguing that the pledge not to str for the duration of the war required some such measure as closed shop to protect unions against the loss of their membe Public opposition to the closed shop was, however, so great t granting it was politically impossible. The board, therefore, vised a provision, known as maintenance of membership, where employees who were members of a union or who joined at time a contract with the employer was signed, were requi to remain members for the life of the contract. This ruling, l the "little steel" formula, was applied in settling virtually disputes about this issue.

The more or less successful disposition of wages and the clo shop by these decisions of the board drastically curbed the casions for quarrels and strikes. Interruptions to work, con quently, while numerous, were short-lived and the losses fr strikes and lock-outs were far less than in preceding years. De sions of the board were generally obeyed. But in a few cases government was forced to take over plants, either to end a str or to impose the board's decision upon an unwilling employ

As war administration grew more elaborate and was entrus with the authority to make more and more vital decisions, labour movement continued to insist upon fuller representation the Washington councils. This demand became increasingly sistent upon the retirement of Sidney Hillman, one of the lead of the C.I.O. and co-director of the Office of Production Mana ment, when that agency was superseded by the War Product board under the chairmanship of Donald Nelson. While organi labour failed to win representation equivalent to that held Hillman, it made its influence felt by appointments to vari advisory boards and by the effective pressure it was able to ex on Washington.

The result was that the unions had their way on many ba issues. Union-management committees, originally proposed by C.I.O. and later endorsed by the A.F. of L., were swiftly int duced into a substantial number of war plants. In spite of mu public clamour for lengthening the work-week, the 40-hour w was retained. Union influence prevented the freezing of ployees on their jobs and in general reduced to a minimum amount of compulsion used in administering the country's m power program. Only in relation to the overall problems of production did labour influence appear to subside. For the sw conversion of peace to war industry and the phenomenal rise munitions production rendered obsolete the Reuther plan, wh had been a universal subject of discussion and contention in 19

Efforts to compose the differences between the A.F. of L. the C.I.O. made little progress. At the beginning of the ye John Lewis proposed that peace negotiations be reopened. T fear that Lewis might succeed and thereby gain in prestige influence caused both William Green and Philip Murray to rej his offers of intervention. The administration joined in this action. To counteract Lewis's peace proposals, the president up a joint C.I.O.-A.F. of L. committee (the so-called lab victory committee) to meet with him for the purpose of cussing and settling questions affecting the two organizati and labour policy in general.

This public rebuff of Lewis exacerbated his differences w the C.I.O. and Murray. Lewis immediately took steps to pun Murray and to separate the United Mine Workers from

THE FOURTH OF JULY, 1942, was only another day of work for labourer U.S. war plants. Strikes were at a minimum in 1942 as labour unions avoi stoppage of work during disputes. In the first half of the year, fewer man-h of work were lost through strikes than in any six-month period in U.S. hist

I.O. At successive meetings of the Miners' executive board d convention, the union withdrew from the C.I.O., displaced urray as vice-president of the Miners and expelled him from embership in that organization. The United Mine Workers, w free of any affiliations, amended its constitution to extend jurisdiction over all industry and by that act virtually conrted itself into a third federation of labour competing for memrs with all other existing unions.

Meanwhile the standing peace committee of the A.F. of L. and I.O., which had not met for a long time, resumed its conversans. Before the year was over it had agreed to recommend to two organizations the creation of an arbitration board, emwered to settle inter-union disputes. The recommendation was vourably received. But before it could be adopted, a bitter ntroversy, which broke out between C.I.O. and A.F. of L. ions over union control of the Kaiser shipyards, again reduced chances for peace.

Under the favourable influences of full employment and rising ges, most unions continued to grow. The A.F. of L. added ughly 500,000 members. The C.I.O.'s total membership reined unchanged during the year, but this meant that it made in other directions the loss of the 600,000 members of the ited Mine Workers. Organized labour's gains in numbers were, wever, not matched by the enhancement of its prestige. Unions ne increasingly under criticism for their reluctance to abandon 40-hour week, the suspicion that they were indifferent to slowwns and restrictions of output, and the continuance of interion quarrels. In consequence, organized labour, together with administration, lost heavily in the congressional elections November. (*See* also American Federation of Labor; siness Review; Congress of Industrial Organizations; w; National Labor Relations Board; Strikes and Lockts.) (L. Wo.)

Great Britain.—British trade union membership again inased during 1941. The membership of the unions affiliated to Trades Union congress rose from 5,079,094 to 5,432,644, de up of 4,509,515 male and 923,129 female workers. Figures re not available for the unions outside the congress, of which most important were the teachers' societies and the unions the civil service and the post office, which latter groups were l precluded from affiliation by the Trade Unions act of 1927. orts to get this act modified again broke down in face of the position of the Conservative party and the refusal of the prime nister to take any action without its consent. This refusal proked strong resentment at the 1942 congress.

Trade union membership continued in 1941–42 to increase idly among workers in the munition trades. The principal neficiaries were the Amalgamated Engineering union (550,000) resenting mainly the more skilled workers, and the two "genl labour" unions—the Transport and General Workers (650,) and the General and Municipal Workers (548,000)—which ol the less skilled workers. The former now included 190,000 l the latter 147,000 women. Other big increases were in the ectrical Trades union (97,000) and the Fire Brigades' union ,000), which enrolled a large proportion of workers in the rtime National Fire service. As against these advances, there re shrinkages in many of the unions catering for workers in des subject to wartime contraction, notably in the cotton instry. Apart from these instances, membership remained fairly ble, despite the war.

Wages and conditions continued to be regulated by the normal cesses of collective bargaining, supplemented by the resort to itration by the National Arbitration Tribunal or by *ad hoc* unals, in place of resort to strike action. Strikes were relaely few and unimportant, and mostly of short duration. The largest number occurred in the mining industry, which accounted for 390 stoppages out of a total of 804 in all industries during the first eight months of 1942. But most of the mining stoppages were small and brief, and in general the workers showed a high determination to do their best in furtherance of the war effort. In the munition trades and in coal mining, the sphere of collective recognition was extended by the establishment in most of the larger factories and collieries of joint production committees and joint pit committees, with a mandate to consider all possible methods of increasing output, without interfering with the normal process of collective bargaining between trade unions and employers' associations. These joint bodies, of which the workers' sides in the war factories worked in closely with the shop stewards' committees created by the employees, were undoubtedly effective in raising output and improving relations where they were given a fair trial.

APPEARING ON A PLATFORM TOGETHER for the first time, April 7, 1942, at Pittsburgh, Philip Murray (left), president of the C.I.O., and William Green (right), president of the A.F. of L., pledged unity in the ranks of U.S. labour for the duration of World War II. Between them is Paul V. McNutt, Federal Security administrator and later chairman of the War Manpower commission

The Trades Union congress, held in Sept. 1942, was exceptionally interesting because it revealed a sharp conflict of tendencies. The general council, which received the support of the two "general labour" unions, was assailed on several issues by the more advanced sections, headed by the miners, railwaymen and engineers. A demand for a larger measure of "workers' control" in industry was carried against the general council, and a proposal to set up an enquiry into the basis of trade union organization, sponsored by the National Union of Railwaymen, was only defeated by a small margin. Sir Walter Citrine's account of his negotiations with the American Federation of Labor in the matter of trade union unity between the three movements of Great Britain, the United States, and the soviet union was received with considerable dissatisfaction, many delegates holding that the congress secretary should have insisted on negotiating directly with the C.I.O. and the Railroad Brotherhoods, as well as with the A.F. of L. British labour opinion was solidly in favour of a triple alliance of the labour movements of the three countries on an all-inclusive basis, and was much distressed at the refusal of the A.F. of L. to take part in such an alliance. In general, the British trade unions continued to improve their position, without making any sensationally rapid advance. There were affiliated to congress four unions with upwards of 500,000 members, three others with over 100,000 (railwaymen 376,000, distributive workers 234,000 and woodworkers 157,000), and 15 others with over 50,000. The total number of affiliated trade unions was 252; and there were in addition 412 recognized local trades councils up and down the country, including a number of smaller unions not affiliated to congress. Total trade union membership was probably between 6,500,000 and 7,000,000, including civil servants, local government officers, teachers and other nonaffiliated groups. (G. D. H. C.)

Labrador: *see* Newfoundland and Labrador.

Lacrosse. Fielding the finest team in its history, Princeton university won the Inter-collegiate Lacrosse championship in 1942 and thus wrested the title from the state of Maryland for the first time in many years. The Tigers' 12–10 victory over the University of Maryland and their 4–2 decision over Johns Hopkins of the same state were the high lights of the season.

A year ago it was Johns Hopkins which returned to top strength to win the championship, and the year before that it was the University of Maryland which finished in top place. Army finished in fourth place behind the two Maryland teams. In its annual game with navy, army won by a score of 6–3.

The annual north-south game in Baltimore resulted in a 6–4 victory for the north, but in a special abbreviated game two weeks later in New York, the south was the winner, 5–1.

Like most college sports which had been affected by the 18–19 draft board, lacrosse probably was expected to be slowed down for the duration. This might increase the interest in women's lacrosse which in 1942 was represented by teams from Boston, Baltimore, Philadelphia, Westchester, New York, and a few cities in the middle west where the game was being introduced at girls' colleges. (T. J. D.)

La Guardia, Fiorello Henry (1882–), U.S. politician, was born in New York city, Dec. 11. He went to high school in Prescott, Ariz. From 1901 to 1906 he served in U.S. consulates in Hungary and Austria. He graduated from New York university law school in 1910 and was congressman from New York, 1917–21 and 1923–33. He commanded the U.S. flying force on the Italian front during World War I. In 1933 he was elected mayor of New York city; he was re-elected in 1937 and again in Nov. 1941. In Aug. 1940, Pres. Roosevelt appointed him chairman of the U.S. section of the Canada-United States permanent joint board of defense, and in May 1941 the president named him director of the Office of Civilian Defense. La Guardia resigned the directorship on Feb. 10, 1942. In the fall of 1942, La Guardia made several broadcasted appeals to the Italian people to overthrow Mussolini and join the Allied side.

Land Emory S. (1879–), U.S. naval officer and government official, was born Jan. 9 in Canon City, Colo. He was graduated from the University of Wyoming, 1898; Annapolis, 1902; and the Massachusetts Institute of Technology, 1907. During World War I, he served on the staff of Admiral William Sims in London. Associated with problems of naval construction after 1904, he was assistant chief of the navy's bureau of aeronautics, 1926–28; chief of the bureau of construction and repair, 1932–37. Made a rear admiral when he retired from the navy in 1937, he was named commissioner of the U.S. maritime commission in 1937, and succeeded Joseph Kennedy as chairman in 1938. Soon after the United States entered World War II, Admiral Land was also made administrator of the War Shipping Administration, established Feb. 7, 1942. He had control of the operations, purchases, requisitioning and use of all U.S. merchantmen. He was also a member of the Anglo-U.S. combined shipping adjustment board, which was created in Jan. 1942. He declared on Nov. 12 that President Roosevelt's goals of 8,000,000 tons of new shipping for 1 and 16,000,000 tons for 1943 would be achieved on schedule.

Lard. There was an unprecedented volume of U.S. lard p duction and yet a serious shortage for civilian consum tion in 1942. Production was estimated roughly by the depa ment of agriculture as more than 2,500,000,000 lb., which w short of the 1942 goal of 2,820,000,000 lb. The Food Distri tion administration bought more than 1,000,000,000 lb. of ve table oils and animal fats. Of this total, 654,000,000 lb. was la 171,000,000 lb. vegetable oil, 96,000,000 lb. margarine, 45,0 000 lb. shortening, 33,000,000 lb. butter, 26,000,000 lb. edi beef fats. Predominant purchases for military and lend-lease u made it difficult for housewives to buy lard in the latter mon of 1942. Also in these later months hogs, although averag about 7 lb. heavier, yielded about 2 lb. less lard per carcass th in 1941, indicating that packers were trimming carcasses to rea on the higher prices for pork. Storage supplies of lard in United States Dec. 31, 1942, were 11,190,547 lb. compared w 111,953,101 lb. Dec. 31, 1941. From Dec. 1941 to Dec. 19 the price of lard advanced 38%. Butter prices in the same per rose 32%. At the beginning of 1943 the top price for lard about 3 cents per lb. above the ceiling price a year earlier, OPA having revised lard ceilings several times in 1942. Latvia. One of the Baltic states of northeastern Euro north of Lithuania, south of Estonia, formerly a public; in 1941 it became part of the German "Ostland." A 25,016 sq.mi.; pop. (est. Jan. 1, 1939), 1,994,500. Capital, R (385,063 in 1935); the other principal city is Liepaja (57,0 Language, Latvian. Religion, Christian (Protestant, 56%; Ro Catholic, 24.5%; Greek Catholic, 9%; Greek Orthodox, 5.5 The country was ruled, after the German occupation in 1 by Commissioner-General Drechsler for Latvia, and Reichsc missar Heinrich Lohse, whose seat of government not only Latvia but for the entire Ostland (*q.v.*) was established in R

History.—Like her neighbours Estonia and Lithuania (*qq.* Latvia was forced to bow first to one, then another, of the w ring great powers: from June 1940 to June 1941 she was oc pied and largely collectivized by the U.S.S.R.; in July 1941 was occupied and "new ordered" by the nazi reich. Mass depo tions were carried through by both the conquerors, and the ec omy was forced through violent changes. Before 1940 less t 3½% of Latvian trade was with the U.S.S.R., then for a yea was entirely Russian-controlled; in 1941 this trade was c pletely choked off. Before 1940 some 35–40% of her exports w to Great Britain; then that trade was stopped. In 1942 the C mans were frankly having difficulty in reviving normal econo life. An appeal to countries like Denmark and Belgium was tempted to help in colonization and economic development, inspection trips were arranged in the Baltic States for such as Gunnar Larsen, Danish Minister of Transport.

Internal conditions in Latvia were of course largely depen the war, which toward the end of 1942 again approached her rders as the Russians advanced. Large stocks of goods were quisitioned for the war, but details of food and clothing conditions were not available.

Beyond the country's borders several Latvian ships flying the imson-white-crimson flag were torpedoed in the Atlantic and sewhere. A Latvian pro-soviet government continued to exist exile in Russia, while in Great Britain and the United States e ministers appointed prior to the soviet occupation continued function. Latvians were deeply interested in the signature of e Anglo-Russian 20-year alliance (June 1942), which, although did not specifically mention the Baltic states, was assumed to arantee their restoration after the war.

Statistics of education, finance and economic conditions ceased be issued in Latvia after the soviet occupation in 1940; the est available figures at the end of 1942 applied for the most rt to 1938 and 1939.

Education.—In 1938–39 there were 1,895 elementary schools th 229,825 pupils and 114 secondary schools with 25,225 pupils. rolment at the University of Riga was 7,281.

Finance.—The monetary unit is the lat (=19.3 U.S. cents at r, established as equivalent to the Swiss franc in 1921). Effects German control were still uncertain at the end of 1942. In 39 the budget estimates envisaged revenue of 190,878,000 lats d expenditures of 190,481,000 lats.

Trade and Communication.—Imports in 1938 were 227,336,-o lats; exports 227,204,000 lats. Chief articles of import were dustrial machinery, agricultural machinery, automobiles and cessories, coal, cotton textiles, cotton (raw) and wheat. Chief ticles of export were timber, flax, plywood and butter. Exports nt chiefly to Great Britain, Germany, the U.S.S.R. and the etherlands. Imports were primarily from Germany, Great Brit-ı, the U.S.S.R., Sweden and the United States. In 1940 the tvian state railways operated over 2,200 mi.; bus lines over 300 mi. The principal harbours are Riga, Liepaja and Ventspils.

Agriculture.—The principal crops with their yields (in short ns) were as follows in 1939: rye, 493,830; barley, 245,041; ts, 534,395; wheat, 233,247; potatoes, 1,807,882; flax, 54,123. vestock included 414,470 horses, 1,271,730 cattle, 1,469,570 eep, 891,470 pigs, 4,729,120 poultry, 222,460 beehives.

Manufacturing.—After the decline in 1931 and 1932, Latvia's dustrial production rose rapidly to a general index figure of 148 1937 (based on 100 in 1930). Strong efforts were made up to 39 to increase the self-sufficiency of the country.

At the beginning of 1939 some 5,970 industrial establishments ıployed 98,500 persons, and in 1938 produced a value of 695,-o,000 lats. Chief industries were foodstuffs, wood and paper d textiles. (F. D. S.)

aval, Pierre (1883–), French statesman, was born June 28 at Châteldon, Puy-de-Dôme. For a brief ographical sketch, see *Encyclopædia Britannica*. Laval had reained in comparative obscurity after the start of war in 1939 itil Marshal Pétain, after France's defeat, named him his sucssor as well as vice-premier. An opportunist, Laval consulted th Hitler on several occasions in 1940 and displayed obvious o-nazi inclinations. A rift between Pétain and Laval occurred, d the latter was abruptly dropped from the Vichy cabinet ec. 13, 1940. Laval was not reinstated until April 18, 1942, hen he formed a new cabinet and assumed the title of chief government. In the summer of 1942, most French workers nored Laval's plea that they help "crush bolshevism" and lease French war prisoners by working in German factories. n Oct. 20, he said that French workers "must go" to Germany orders of the government. On Nov. 18, a week after the Germans had occupied all of France, Pétain gave Laval dictatorial powers to make laws and decrees on his own responsibility. Within 48 hours, Laval delivered a violent tirade against Britain and the U.S., proclaimed confidence in eventual axis victory and asserted that a pact with the reich was the sole guarantee of keeping peace in Europe.

"THE ONLY WAY—IN" a British portrayal of the strange doorway constructed for France in 1942 by Pierre Laval. Cartoon by Butterworth of the Manchester *Daily Dispatch*

Law. Global war overshadowed all developments of the year 1942 and from its effects not the minutest phase of civilian life or activity was exempt.

Against this background law had a dual aspect—regulations on the home front governing the regular workaday relations and problems of a civilian economy, and war regulations, more summary in nature and sweeping in scope, whose direct impact was everywhere reflected.

Accordingly the year's most significant decisions and regulations are reviewed under the following headings:

Administrative Law
Agriculture
Arbitration
Banking
Bankruptcy
Civil Rights
Constitutional Law
Criminal Law
Domestic Relations
Housing
Insurance
Labour
Libel
Patents
Public Contracts
Public Utilities
Social Security
Tax: Local, Federal
Trade Regulation
Unemployment Compensation
War Regulations
Workmen's Compensation

Administrative Law.—The right to judicial review of board findings was the outstanding issue of administrative law. While arising in cases involving broadcasting, rate making and labour relations, the principles promulgated are applicable to practically every field of business operation.

The supreme court refused to grant a review of rate-making orders (*FPC* v. *Natural Gas Pipeline Co.; Board of Trade of Kansas City, Mo.*, v. *U.S.*). Courts will not substitute their judgment in these technical matters for that of the commission, where the board has not overstepped the limits of due process.

Since, however, it has the force of law, a commission's "order" may be reviewed before it is invoked as well as after (*Columbia Broadcasting Co., Inc.*, v. *U.S.*). A decision of the Railroad Retirement board that persons employed by a copper mining company were "employees" within the meaning of the act so as to subject them to the jurisdiction of the board was not final and hence subject to review by the court (*Utah Copper Co.* v. *Railroad Retirement Board*). A determination by the FPC that a company was a public utility within the definition of the act and that therefore the purchase of its stock by another company, admittedly a public utility, unauthorized by the commission, violated the act, likewise was subject to review (*Jersey Central Power & Light Co.* v. *Federal Power Comm.*). The supreme court overruled the commission's orders to the extent that they limited the types of commodities that might be carried over designated routes (*Howard Hall Co., Inc.,* v. *U.S.; U.S.* v. *Carolina Freight Carriers Corp.*). The supreme court held that the U.S. court for the District of Columbia had the power to stay the enforcement of an order of the FCC pending determination of an appeal to preserve the *status quo* (*Scripps-Howard Radio, Inc.,* v. *FCC*).

In a proceeding to enforce an NLRB order, the court properly refused to allow the employer to produce additional evidence that all its assets had been conveyed to a newly-organized corporation (*Southport Petroleum Co.* v. *NLRB*). Nor can such a reviewing court require as a prerequisite to enforcing the board's order a determination through an election that the labour organization, formerly chosen, still represents the majority of the employees involved (*NLRB* v. *P. Lorillard Co.*).

Agriculture.—The Agricultural Adjustment act of 1938 as amended in 1941 was held a valid exercise of the interstate commerce power of congress as applied to that portion of a farmer's wheat intended for consumption on the farm where it was produced. The control of local farm production is merely incidental to the constitutional control of the marketing of wheat, and necessarily follows from congressional intent to control the total wheat supply. Application of the increased penalties of the 1941 amendment to a crop already planted is likewise valid even though a retroactive penalty, since application of the penalty was contingent upon the actions of the farmer subsequent to enactment of the amendment (*Wickard* v. *Filburn*).

The Florida commercial fertilizer law (which requires inspection on a fee-basis and analysis of fertilizer prior to its being offered for sale within the state) was held inapplicable to the importation and distribution to Florida farmers of fertilizer by the United States department of agriculture in furtherance of the Federal soil conservation program (*United States* v. *Mayo*). But a provision of the California Milk Control act prohibiting distributors from purchasing, processing or otherwise handling milk which is sold at any place within the geographical boundaries of a designated marketing area, whether such place is part of the marketing area or not, at less than the minimum prices established for such marketing area was valid as applied to milk processed and handled for sale at less than prescribed minimum prices to the federal government on federal territory (*Pacific Coast Dairy, Inc.,* v. *Department of Agriculture of California*). (*See* also AGRICULTURE.)

Arbitration.—Though commercial as well as labour disputes have greatly enhanced the scope of arbitration, the inconsistent emergency legislation has curbed it. Thus, an order of OPA made performance of a contract for sale of goods impossible, hence nonperformance was excused and the entire contract, including the arbitration clause, was terminated as inconsistent with an OPA schedule. (*Eddington Fabrics Corp.* v. *M. Lowenstein & Sons, Inc.*). Similarly held unenforceable was a contract, containing an arbitration clause, which had become impossible of performance because of the establishment of ceiling prices by the Office of Price Administration and certain regulations issued by the Office of Production Management (*Matter of Kahn & Feldman, Inc.; Rothschild et al.;* etc.).

However, an order of the Defense Communications board directing the closing of defendant's radio station did not excuse it from its agreement to arbitrate any controversy which occurred during the period of its operation (*Matter of Sell, Pres. of American Communications Assn.; French Telegraph Cable Co.*).

Nor could one avoid his obligation under an arbitration ag ment on the ground that the WPB order limited his invent The regulation did not invalidate the contract; it merely pro ited delivery of the merchandise by the seller and acceptance the buyer, if at that time the inventory of the buyer is the unduly enlarged (*Federated Textiles, Inc.,* v. *Glamour G* Denial of a contract (charter party) did not constitute a wa of an arbitration agreement embodied in that contract (*K Kundis Shipping Co.* v. *Amtorg Trading Corp.*). Though erally an infant may disaffirm his contracts, an infant appren may not reject arbitration provisions of his contract with employer while affirming the provisions relative to his tenur employment (*Farin* v. *Sercarz*).

In confirming an arbitrator's award (that an employer executed a collective bargaining contract with a union "shall voke . . . the rule announced by it excluding the lunch or hour from the eight hours per day to be paid for") a court r that it did not bar employees from maintaining a subsequ action against the employer to recover pay for the lunch hou provided in the contract (*Alper* v. *Greater New York Broadc ing Corp.*). But an award of an arbitration board increa wages was invalidated because the board did not decide the q tion of a fair work load in arbitrating the question of a fair of wages and fair work load (*Boott Mills* v. *Board of Conc tion and Arbitration*).

Banking.—To prevent the occupied countries from b looted, an executive order froze bank deposits of invaded c tries and their nationals. The prohibition extends only to the ment or transfer of the funds. The sole purpose of the order to prevent the funds of certain foreign nations and their natio from falling into the hands of the aggressor powers. The or however, did not preclude a state court from subsequently e cising its jurisdiction in an action by a domestic corporatio which were attached New York bank deposits belonging to national bank of a country subject to such executive order (*C mission for Polish Relief, Ltd.* v. *Banca Nationala a Ruman* An attempt of a New York bank to credit its branch in Pa France, with the proceeds of a check deposited in such branch a French national for collection was ineffectual and void as a lation of the executive order extending the restrictions on tr fers of credit to transactions in which France or any natic thereof has any interest (*Philip* v. *Chase National Bank of City of New York*).

But an executive freeze order, prohibiting payments by ba to nationals of foreign countries except as authorized by the retary of the treasury, did not prevent a levy, under a warran attachment, on the bank account of a foreign national; nor di affect the court's acquiring dominion, by virtue of such a le over the defendant's rights and interest in the account (*Com sion for Polish Relief, Ltd.* v. *Banca Nationala a Rumani* (*See* also BANKING.)

Bankruptcy.—The decisions considered conflict between eral and state laws, priority of federal claims and the jurisdic of the bankruptcy courts.

A New Jersey statute authorizing a refunding plan more t a year before the enactment of the Municipal Bankruptcy did not conflict with the latter, nor did the state statute unc stitutionally impair the obligation of the contract (*Faitoute & Steel Co.* v. *City of Asbury Park*).

A bankruptcy court need not apply local law governin liquidation of insolvent estates, the Bankruptcy act prescrib its own criteria for distribution to creditors. Hence a guarar and its creditors could not be deprived of the benefits of usual bankruptcy rule of equality by a N.Y. state law requi t their rights be subordinated to those of other certificate lers (*Prudence Realization Corp.* v. *Geist*).

armer-debtors were entitled to file a petition for relief under Frazier-Lempke act (bankruptcy provisions affecting farm- four years after composition proceedings had been insti- d, since that right is not to be conditioned on the diligence n which the farmer sought composition or extension of time *right* v. *Logan*).

bligations which had accrued under the California Unem- ment Reserves act plus a 12% interest were allowed as prior ms against a bankrupt employer (*Meilink* v. *Unemployment erves Comm. of Calif.*). When the assets of the bankrupt e insufficient to meet claims, the claim of the U.S. for social rity taxes was held entitled to priority and the excess of % required was not such a penalty as could not be proved in kruptcy (*U.S.* v. *N.Y.; N.Y.* v. *U.S.*). In a state court receiv- ip proceedings, the claims of the U.S. for gasoline taxes were n priority over the claims of Texas (*U.S.* v. *Texas*).

ivil Rights.—A vigorous press campaign by newspapers de- ding the reversal of a constitutional amendment improperly mitted to the voters, which campaign was waged during the dency of judicial proceedings, could not be adjudged in con- pt of court. Under the doctrine of the Bridges case, the er of the court to punish for contempt is limited to publica- s creating a clear and present danger of substantial evils—*i.e.*, air influence on the court (*Graham* v. *Jones*).

wholly new element was injected into the doctrine of the rnhill case, that peaceful picketing in labour controversies is rm of free speech. The supreme court in a 5 to 4 decision fined the right of peaceful picketing to the "industry" in ch the labour dispute arose. In *Carpenters' Union* v. *Ritter's e,* the supreme court upheld a Texas decree, based on the e antitrust act, enjoining picketing by a painters' and car- ters' union against a restaurant, the owner of which had en- ed a nonunion contractor to erect a building some distance y from the restaurant. In *Bakery Drivers' Union* v. *Wohl,* ided on the same day, the court reversed a New York injunc- forbidding picketing by a bakery drivers' union against the er who sold to, and the grocer who bought from, peddlers of d who refused to hire a union man for one day a week. In instance the picketing was peaceful, truthful and directed hird persons outside the immediate dispute.

he Fair Labor Standards act does not violate the right of edom of the press guaranteed to newspaper publishers by the amendment to the federal constitution (*Walling* v. *Sun Pub- ing Co.*).

he distribution of handbills containing commercial advertise- ts may be regulated without encroaching upon the freedom he press. The court even sanctioned the licensing of the dis- ution of literature (*Jones* v. *City of Opelika*). A federal dis- t court granted an injunction against a compulsory flag salute. ontrary ruling by the U.S. supreme court, though unreversed, ot controlling, it ruled, since a majority of the present mem- s of the supreme court who have expressed an opinion have icated that the holding therein is unsound (*Barnette* v. *West ginia State Board of Education*). A petition by an American zen of Japanese ancestry claiming illegal restraint because of curfew ordered by a military commander of the Pacific coast a was held prematurely brought. The restraint was merely oral" as opposed to "actual" and hence did not warrant the ance of the writ (*Ex parte Ventura*).

n one of the most dramatic incidents of recent supreme court ory, the high court decided that the Nazi saboteurs, arrested e 27, 1942, could be tried constitutionally by a military com- sion and that the commission had been properly established and had followed the correct procedure. When the military trial was completed on Aug. 8, the president announced that six of the saboteurs had been executed and two imprisoned. Further evidence of the desire to safeguard civil liberty in time of war was the supreme court's special session to consider petitions of habeas corpus on behalf of the prisoners. The high court, in effect, required the military commission to show its credentials (*U.S. ex rel. Burger et al.* v. *Cox*). (*See* also CIVIL LIBERTIES.)

Constitutional Law.—Emergency legislation was sustained against attack on its constitutionality. Freeze orders prohibiting sales of commodities, *e.g.*, tires, typewriters, etc., were upheld as proper regulations, since they did not constitute an unlawful taking of property within the restriction of the 5th amendment of the federal constitution (*Henderson* v. *Bryan*).

The supreme court ruled that New York's property law must yield to executive agreements as the supreme law of the land, *i.e.*, the Litvinov agreement under which the U.S. rather than foreign creditors was entitled to the assets of the First Russian Insurance Co. (*U.S.* v. *Pink*).

A Georgia statute was invalidated which penalized one who contracted to perform service without intending at the time to perform, since the threat of punishment resulted in involuntary servitude (*Taylor* v. *Georgia*).

Discriminatory classification of crimes rendered the Oklahoma Criminal Sterilization act unconstitutional since it violated the equal protection clause of the federal constitution. It subjected to sterilization habitual criminals, defined as any person thrice guilty of crimes involving moral turpitude, exempting embezzlement, political offenses, violations of prohibitory laws and the revenue acts (*Skinner* v. *State ex rel. Williamson*).

Refusal of a state court to appoint counsel for an indigent defendant indicted for a noncapital offense was not a deprivation of liberty in violation of the 14th amendment. Not every denial of counsel constituted denial of due process. The cases in which the supreme court held a denial of due process were those in which the accused had been denied a fair trial (*Betts* v. *Brady*).

A former U.S. attorney, charged with conspiracy to defraud the U.S., was deprived of his constitutional rights when he was denied separate counsel in a joint trial of the alleged conspirators, since he did not waive this right. There was no deprivation of due process by the exclusion of women from the federal jury lists from which the indicting federal jury, sitting in Illinois, had been selected, despite an Illinois statute providing for women jurors (*Glasser* v. *U.S.; Kretske* v. *Same; Roth* v. *Same*). It was held that one not an attorney may waive his right to counsel and trial by jury in federal criminal court proceedings (*Adams* v. *McCann*).

Criminal Law.—To be punishable, fraudulent statements must be intended to affect the federal agency involved (*Terry* v. *U.S.*). The unauthorized taking of scrap from a plant under government contract was adjudged a federal crime (*U.S.* v. *Anderson*). A conviction for intimidating witnesses was sustained although no proceedings were pending at the time (*U.S.* v. *Perlstein*). The addressing of disparaging remarks to a member of the armed forces was held to constitute disorderly conduct (*N.Y.* v. *Vogt*).

Testimony adduced by divulging to a witness the contents of an illegally intercepted telephone message was held admissible in evidence, since no use of the intercepted communications or their contents was made at the trial. Such a disclosure would have been a violation of the Federal Communications act (*Goldstein* v. *U.S.*). Likewise, the overhearing, through the use of a detectaphone placed in an adjoining room, of what a person stated into a telephone transmitter was not a violation of the Federal Communications act, since there was neither a communication nor an interception within the terms of the act. Neither the trespass involved in placing a detectaphone in the room on the previous day nor the use of the detectaphone violated the 14th amendment of the federal constitution (*Goldman* v. *U.S.*).

A convicted defendant's charge that his plea of guilty had been obtained by FBI coercion should have been heard (*Waley* v. *Johnson*) as should have been a charge that perfection of an appeal was prevented by prison officials (*Cochran* v. *Kansas*). A convicted defendant was entitled to a writ of habeas corpus to prove that his conviction was based on testimony known to be perjured and the suppression of favourable testimony through intimidation (*Pyle* v. *Kansas*).

A plea of guilty at a preliminary hearing was not admissible as evidence when at the time of making it the accused had neither counsel nor was he advised of his rights (*Wood* v. *U.S.*).

Domestic Relations.—Insanity does not bar a person from maintaining, through a legal representative, an action for divorce under a New York statute which contains no provisions expressly precluding such an action by an incompetent (*Mohrmann* v. *Kob*).

A person in the military service of the United States was held entitled to relief from an order requiring payment of alimony (*McGlynn* v. *McGlynn*).

The full faith and credit clause of the federal constitution required that a North Carolina state court recognize Nevada divorce decrees in a prosecution under a North Carolina statute for the bigamous cohabitation of two individuals who obtained such divorce decrees in Nevada on substituted service, neither spouse appearing in the Nevada actions. The decision overrules the leading case, a milestone in supreme court history, *Haddock* v. *Haddock* (201 U.S. 562) (*Williams* v. *North Carolina*).

Sentence of life imprisonment, resulting in the civil death of the husband released the wife from any property obligation to her husband without any further action by her (*In re Lindewall's Will*).

Housing.—The obligation of the Federal Housing administrator as insurer of a loan by a bank to an industrial corporation could not be avoided in its entirety because the loan contained certain items which were ineligible for insurance, in the absence of fraud or an intent to evade the provisions of the National Housing act (*Ferguson* v. *Union National Bank*).

A state housing project was held not "public property used exclusively for any public purpose" within the meaning of the provision of the Ohio constitution authorizing enactment of a statute exempting such property from taxation (*Columbus Metropolitan Housing Authority* v. *Thatcher*).

A covenant prohibiting under penalty the sale or transfer of a residence to a "Negro or coloured person" was not enforceable in equity where the neighbourhood was changing as to character and environment so that enforcement would impose a hardship rather than a benefit (*Hundley* v. *Gorewitz*). (*See* also HOUSING.)

Insurance.—A federal court had jurisdiction of an action by a state insurance commissioner seeking a decree to entitle him to administer assets deposited with him by an insurance company for which a receiver had been appointed by another state and, it was held, should determine the rights of the commissioner as receiver, and of his state under its state law (*Fischer* v. *American United Life Ins. Co.*). The supreme court decided that an action brought by a reinsurer in a federal district court, on the basis of diversity of citizenship, for declaratory judgment to determine its rights under a reinsurance agreement, was improperly dismissed by the district court (*Brillhart* v. *Excess Ins. Co. of America*).

Evidence of disability, on or before the expiration date of his war risk insurance policy, was held to be established by a veteran's personal history of 15 years subsequent to injury (*Halliday* v. *U.S.*). However, failure to contradict, qualify or explain by evidence government proof of an insured veteran's admis after reinstatement of a war risk policy, contradictory to sentations concerning his health made in his application for statement, led the court to sustain a directed verdict in f of the government on its defense of fraud (*Pence* v. *U.S.*)

X-ray burns acquired in professional practice, resulting in putation, constituted a compensable injury under an acc policy insuring against loss from bodily injuries "through ext violent and accidental means" (*Murphy* v. *Travelers Ins.* Death from drowning due to a forced plane landing at sea held to result from participation in aeronautics within the r ing of a life insurance policy clause excluding it from d indemnity (*Neel* v. *Mutual Life Ins. Co.*) (*See* also INSURA

Labour.—*National Labor Relations Board.*—Managemen the right to freedom of speech (*NLRB* v. *Virginia Electr Power Co.*), but this right could not be used to utter derog statements about unionization, or to convey anti-union sentin to its employees through a public-address system. Such union language could be construed as interference if accomp by anti-union acts. Management had the right to due delibera but could not use it to avoid or delay the collective barga process. It also had the right to effect non-discriminatory t fers of its employees from one job to another; to threaten rep ment of economic strikers; to retain in his job an employee declined to apply for union membership, where the contrac not call for discharge; to refuse to handle employees' grie with an outside union; and to appeal to strikers and the p in defense of its version of a controversy.

It was management's duty to refrain from coercion, favouritism, from failing to follow grievance procedure called for. It was also management's duty to bargain collec in good faith and not to interfere with its employees' righ collective bargaining. The duty to bargain included the du bargain over the meaning of the contract as well. Manage it was held, must refrain from discriminatory discharge employee and from giving any assistance to a union. Nor an employer reduce the work day in violation of a contract.

Employees were held entitled to the protection of the W act even though they passed a resolution condemning thei ployer. A union could not take measures against members ing to strike in violation of a binding stabilization agree Economic strikers were held entitled to reinstatement ove or former workers, where no valid reason existed for not stating them. But there was no reinstatement for strikers v ing a no-strike agreement. Employees were held entitled to statement even though they participated in a demonstration. had the right to be represented by a collective bargaining ag and when discriminatorily discharged, were entitled to back and to vacation pay, even though the vacation was spent o picket line.

A union could not employ violence to influence an ele nor could the union penalize its members for using a labou ing device in furthering the war program. Labour was hel mune from the Antiracketeering act (*U.S.* v. *Local 807,* *national Brotherhood of Teamsters*), but not from the kickback law, nor from being held in contempt of court fo lating an injunction.

The burden was on NLRB of proving discrimination, could rely on circumstantial evidence in establishing the labour practice. For discriminatory discharge, reinstatemen back pay were ordered by the court. Part of the penalty on agement was the posting of notices to its employees in accor with the board's orders. A union was deprived of its barg status as a result of an economic strike; enjoined from pic during pending NLRB proceedings, and from compelling sto materials in an effort to impose a closed-shop contract. Work ppage in violation of a contract was held grounds for penaliz- labour. An election was voided where the union electioneered.

air Labor Standards Act.—The Fair Labor Standards act, ose constitutionality was upheld at the 1940–41 term, was the ject of five opinions of the court. The act was given a broad lication in an opinion that building service employees of a llord leasing quarters to tenants producing goods for inter- e commerce are subject to the Wage-Hour act (*A. B. Kirsch- m Co.* v. *Walling; Arsenal Building Corp.* v. *Walling*).

he court upheld an employer's freedom of contract to fix gular rate of pay" on the basis of which overtime compensa- is computed (*Walling* v. *A. H. Belo Corp.*) and the provi- of the act for liquidated damages (*Overnight Motor Trans- tation Co., Inc.,* v. *Missel*). The court also ruled that the inistrator of the wage and hour division does not have ority to delegate his subpoena power (*Cudahy Packing Co. a., Ltd.,* v. *Holland*); and that tips may be treated as "wages" er the act (*Williams* v. *Jacksonville Terminal Co.; Pickett* v. *on Terminal Co.*).

here there was a premium for night work, and an employee paid both rates, his overtime was to be computed on both s. Where two jobs were involved under the Wage-Hour and lsh-Healey acts overtime was to be computed as time and a of average hourly earnings for the entire work week or the rly or piece rate at which he was employed during overtime rs. Overtime is 150% of the regular, not the minimum wage. as held that employees could not bargain away their right to rtime. Employees in both intra- and inter-state commerce l not show the time spent in each for recovery under the ge-Hour law.

lanagement was held entitled to a detailed charge against it violation of the act, and on management was the burden of owing its agents' activities. It was held that the Wage-Hour inistrator may not delegate his power to subpoena, nor em- on "fishing expeditions" in demanding the production of ords.

onsent decrees prescribed acceptable employer conduct and ricted the delivery of "hot goods." Penalties were imposed on employer who accepted a "kickback" of part of restituted es; contempt of court in disobeying an order or violating a sent decree was punished by imprisonment. Injunctions were ained against employers even where violation had ceased. vever, where there was full compliance, an injunction against her violations was held unnecessary. Going out of business or orate reorganization afforded no protection against an injunc- . Evidence of past violations was held inadmissible. The idated damages award was ruled mandatory and not to be ved; an employee's release to such effect was held worthless.

ibel.—The insertion of a picture of the complainant's house a bank's institutional real estate advertisement warranted a l action. In the particular case, there appeared beneath the ure the words: "An important question 'To rent or to own'— nge a house into a home by owning it—we will help you de- how." Readers of the newspaper, the court stressed, might draw the inference that the bank was offering the house for and had acquired it upon a foreclosure due to the home er's (plaintiff's) financial inability to perform his obligations. plaintiff testified that the defendant had no mortgage upon house. Although inability to meet one's obligations does not essarily show want of good character, it may lower one in the mation of the community (*Goss* v. *Needham Co-operative k*).

woman against whom a libellous charge of incontinency was le in a telegram may recover from the telegraph company transmitting the message. Even though the telegram was libellous on its face, the defendant, being a public service corporation, was required by law to transmit it, provided in so doing it acted in a manner free from malice. The telegraph company acted under a qualified privilege, the qualification being that the receiving, sending and delivering of the telegram was bona fide, in the regular course of its business and free from ill-will or malice. The burden of proving want of good faith or malice was upon the plaintiff, which the jury here found (*Parker* v. *Edwards*).

A circular of a labour union which, among other recitals, contained a question whether the employer had "the inspiration to establish herself as the American 'Hitler' in the laundry industry" was held not to be libellous, but a privileged communication from the union to its employees whom it was seeking to unionize. Finding no evidence of malice, the court noted that it was only the implication in the question that contained any sting. It was a question and not direct characterization of the employer and was used in a communication to persons interested by one who was also interested, and thus was privileged if made without malice (*Wood* v. *Amalgamated Clothing Workers of America*). But an unincorporated union, through its president, may maintain an action in a New York state court to recover damages from a newspaper publisher for a libel injurious to the union's reputation. The union did not need to form a corporation in order to be recognized as possessing a reputation which the law would protect (*Kirkman* v. *Westchester Newspapers, Inc.*).

In *Sweeney* v. *Schenectady Union Pub. Co.*, the plaintiff, a representative in congress from Ohio, was characterized by the defendant publisher in its newspaper as a spokesman of Father Coughlin who had opposed a Jewish appointee to a federal judgeship. The publication was held libellous *per se* and the plaintiff was not required to allege special damages to recover.

Patents.—The supreme court for the first time in several years held a patent valid in a case involving the issue of patentability. In companion opinions, the court held that however useful a new device may be, it must reveal a flash of creative genius, not merely the skill of the calling, to be patentable (*Cuneo Engineering Corp.* v. *Automatic Devices Corp.; Automatic Devices Corp.* v. *Sinko Tool & Mfg. Co.*).

A patent owner granting licences on condition that the patented machine be used only with unpatented material furnished by the patent owner could not restrain one selling infringing machines (*Morton Salt Co.* v. *G. S. Suppiger Co.*). The court decided that the owner of a method patent authorizing manufacturers to use it only with unpatented materials furnished by it may not enjoin infringement by one supplying the manufacturers with unpatented materials for use by the patented method and aiding in such use. The maintenance of a suit by such owner to restrain any form of infringement was deemed contrary to public policy (*B. B. Chemical Co.* v. *Ellis*).

Nor may recourse be had to the doctrine of equivalents to recapture claims surrendered by amendment in the patent office. The amendment to a claim substituting one phrase for another was said to recognize and emphasize the difference between the phrases and to proclaim the patentee's abandonment of all embraced in that difference (*Exhibit Supply Co.* v. *Ace Patents Corp.; Genco, Inc.,* v. *Same; Chicago Coin Machine Co.* v. *Same*). (*See* also PATENTS.)

Public Contracts.—The supreme court awarded to a shipbuilding company profits which had been characterized by the government as "excessive" and "unconscionable." These profits were paid to a shipbuilding corporation under the terms of World War I contracts, containing "bonus for saving" clauses. The court rejected the government's claim that the profits were unconscionable, that the contracts were signed under duress because of the immediate need for ships in 1917–18, that the profits exceeded the customary profits of the time, and that the corporation did not show special efforts on its part to reduce the costs in order to participate in the bonus for savings (*U.S.* v. *Bethlehem Steel Corp.; U.S. Shipping Board Merchant Fleet Corp.* v. *Bethlehem Shipbuilding Corp.*).

To prevent a recurrence of this, control of profits was instituted through renegotiation. In accordance with a presidential order of April 8, 1942, officers of WPB, the army, navy and the maritime commission were authorized to inspect the books and plants of all companies with a large volume of war contracts to determine whether they had accumulated unreasonable profits. On April 28, the 77th congress passed the Sixth National Defense Appropriations act authorizing and directing the secretary of each department, whenever in his opinion excessive profits have been realized, or are likely to be realized from any contract with such department or from any subcontract thereunder, to require the contractor or subcontractor to renegotiate the contract price; to withhold from the contractor or subcontractor any amount of the contract price which is found as a result of such renegotiation to represent excessive profits; and to recover such excessive amount if paid. The law, which affects contracts exceeding $100,000, also provided that all future war contracts should have a clause permitting their renegotiation, but not more than one year after the close of the fiscal year of such contractor or subcontractor within which completion or termination of the contract or subcontract, as determined by the secretary, occurs.

The secretary of labour may require an employer to produce its wage and hour records of certain plants, even though the employer claimed that some plants were not covered by the Public Contracts act (*Perkins* v. *Endicott Johnson Corp.*).

From *Matter of Dictaphone Corp.* v. *O'Leary,* it appears that though the low bidder has not the right to have the court command the contracting officer to award the contract to him, nevertheless, he is entitled to have the question of lowest responsible bidder decided upon the criteria fixed by law for determining this standard. Should the awarding officer let the contract upon considerations other than those contained in the statutory definition of "the lowest responsible bidder," the unsuccessful bidder may petition the court to compel the award not to a particular bidder but in accordance with legal standards.

Public Utilities.—Public utilities were faced with the task of rationing electricity to effect material curtailment of power use and a state commission deferred to war authorities on the construction of electrical facilities (*Re Ark-La Electric Cooperative, Inc.*); but war, as such, did not exonerate a utility from its public duties (*Pennsylvania Public Utility Comm.* v. *Westmoreland Water Co.*).

The Federal Power commission's scope was deemed broad enough to include an electric power company which operated a generating plant only and sold electric energy to a company which transmitted part of such energy over its own facilities for resale outside of the state (*Hartford Electric Light Co.* v. *FPC*); and even to a company engaged otherwise only in intrastate generation and transmission of electricity, with all facilities within a single state (*Jersey Central Power & Light Co.* v. *FPC*). A sale of stock by one public utility to another was subject to regulation by both state and federal authority (*Jersey Central Power and Light Co.* v. *FPC*). Nor did the FPC exceed its authority in requiring a licence to make a specified accounting disposition of items allowed and disallowed in proceedings to determine the valuation of properties, for rate-making purposes, on the basis of actual, legitimate, original cost (*Alabama Power Co.* v. *FPC*). The SEC did not exceed its authority in requiring the rearrangement of the corporate structure of an operating utility not a holding company, whose fixed liabilities far exceeded the value of its assets (*In re Jacksonville Gas Co.*).

The illegal use of telephones was held to justify discontinua of service (*Pennsylvania Publications, Inc.,* v. *Bell Telephone of Penn.*). (*See* also PUBLIC UTILITIES.)

Social Security.—Generally charitable and educational org izations are exempt from social security taxes (*International form Federation* v. *District Unemployment Compensation Boa* but held not exempt were an institution organized rather for benefit of businessmen than for the public (*Better Busi Bureau of Washington, D.C.*); a military academy whose en receipts were paid as rent to a realty corporation whose offi and stockholders included the directors of the academy (*In Carroll*); and a hospital which maintained itself solely f patients' fixed fees (*Calif. Emp. Comm.* v. *Bethesda Foundati*

A department store was held the subject employer of indi uals employed in leased departments where the store retai control of operations (*Bingo Markets* v. *Administrator*). A da hall owner was held liable for taxes on the taxi dancers he gaged (*Marcovich* v. *Nickell*).

Whether an individual is covered by the Social Security depends in the main upon his status as either an employee o independent contractor; which distinction hinges upon the abse or presence of control over both the result of his work and method and manner of achieving that result. A part-time countant, not certified or registered, was held an employee though there was no actual supervision and some work was d at home (*Archer* v. *Murphy*); but auditors and accountants, cers of a corporation, contracting on their own behalf for s ices to a third party, were held independent contractors w the corporation had no control over such services (*Treas Ruling*). Piece-workers have been held employees (*Peasle Murphy*). A lessee of a soda fountain in a drug store, subjec the owner's control, was held an employee (*Rauschert* v. *M phy*), as was a truck-driver salesman, on the ground of ow control (*Zawacki* v. *Smith*), and itinerant musicians under tract to a dance-hall owner (*Maloney* v. *Wis. Ind. Comm.*).

However, independent contractor status was given to maga subscription solicitors where there was some control over res but none over performance (*Meredith Publishing Co.* v. *I Employment Security Comm.*); and to special artists under tract to a theatre to supplement the regular stage show (*R City Music Hall* v. *U.S.*).

A newspaper subscription solicitor was held unemployed eligible for benefits for any period of 7 consecutive days du which he earned less than $3, though a law effective Nov. 1942, providing for partial unemployment benefits, defines t unemployment as lack of any employment on any day, with such special provision.

Generally, participation in a labour dispute disqualifies an ployee from receiving benefits (*In re North River Logging C* Thus, refusal of intermittent workers to accept accustomed w during a strike was held a disqualification (*American-Hawa S.S. Co.* v. *Calif. Emp. Comm.*). But violent striking and pic ing following an NLRB certified election which was deeme have ended the labour dispute did not affect the eligibility member of the successful union (*Ex parte Badgett*), and ref to continue working under terms of an expired contract was not a labour dispute under the Indiana law (*Knox Consolid Coal Corp.* v. *Bd. of Review*).

Attempts to operate his own business while actively see employment did not disqualify one for benefits (*People* v. *Ne* but a wife voluntarily leaving her employment to join her band in another city was held to have left without good ca and hence disqualified (*Woodmen of the World Life Insur*

v. Olsen). (*See* also SOCIAL SECURITY.)

ıx.—*Local.*—In sustaining a tax on intangibles, the supreme
t noted that these are so associated with their owner that
and their transfer at death are taxable at the place of domi-
where his person and the exercise of his private rights are
ect to the control of the sovereign power (*Graves* v. *Schmid-*
). The court also upheld an estate tax levied by the state of
on the transfer by a New York resident of shares of stock
Utah corporation on the ground that "there is no constitu-
l rule of immunity from taxation of intangibles by more
one state" (*State Tax Comm. of Utah* v. *Aldrich*).

corporation franchise tax levied by California against a
esale distributing house which was one of a series of such
es operated by an Illinois corporation in several states was
valid on the ground that the corporation's business was a
ry and not a separate and distinct business within the state.
r such circumstances, the court ruled, "unity of use and
ıgement of the business which is scattered through several
s may be considered when a state attempts to impose a tax
ı apportionment basis" (*Butler Bros.* v. *McColgan*).

kewise, Tennessee could tax a foreign corporation which was
ged in a profit-sharing joint venture with the local distrib-
company in the distribution of gas to Tennessee consumers.
fact that the foreign corporation had established a commer-
domicile in Tennessee subjected it to a nondiscriminatory
by Tennessee upon its net income even where the corpora-
business was wholly in interstate commerce. (*Memphis*
ral Gas Co. v. *Beeler*).

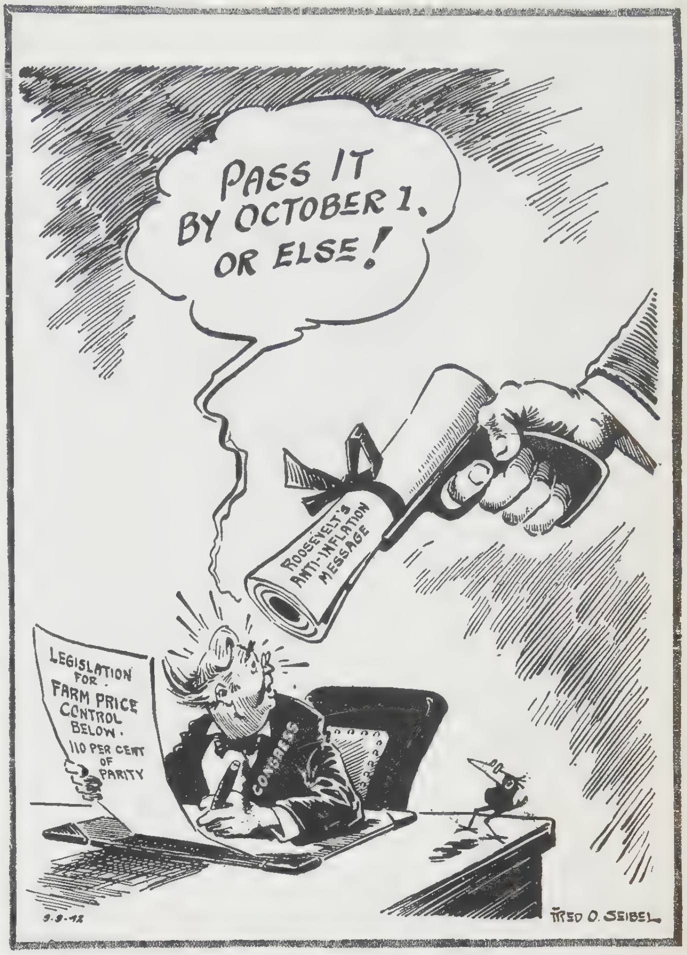
ıce post exchanges are operated as "arms of the government,"
ourt upheld the contentions of the taxpayer for immunity of
post exchanges from California's motor vehicle fuel licence
Standard Oil Co. v. *California* v. *Johnson*).

deral.—The supreme court held that recovery of a judgment
overpayment of federal income taxes against a collector of
ıal revenue does not bar a later suit against the United States
e court of claims to obtain an additional refund of taxes for
ame years (*U.S.* v. *Nunnally Investment Co.*). The court
that there was no "reorganization" as would entitle the tax-
r to exemption through a transaction whereby a bondholders'
nittee bought in the mortgaged assets of the corporation at
losure and transferred the properties to a new corporation in
n for distribution of all of the new corporation's common
to the depositing bondholders. The property was never
red from the old corporation but from a transferee of it
dholders Committee, Marlborough Investment Co. v. *Com'r*
nal Revenue; Marlborough House, Inc., v. *Same*). Nor, said
ourt, did this transaction qualify as a "reorganization" under
rovision which requires that "immediately after the transfer"
transferor or its stockholders or both" be in "control" of the
feree corporation (*Helvering* v. *Southwest Consolidated*
.).

rganization did result where corporate assets were transferred to a
orporation, new bonds and stock distributed to the bondholders of the
orporation, and stock interests eliminated except for the receipt of
purchase warrants. A beneficial owner of, or equitable claimant
operty is not barred from consummating a reorganization merely
se the actual conveyance is made by his trustee or titleholder (*Hel-*
v. *Cement Investors, Inc.; Same* v. *James Q. Newton Trust; Same*
wton).

rule that income is attributable for income tax purposes to the per-
rning it was applied in taxing a railroad company, which had leased
its property in perpetuity without a defeasance clause, where the
l dividends were paid by the lessee to the lessor railroad's stockhold-
ursuant to the lease agreement, and the federal income tax on divi-
payments was paid by the lessee (*U.S.* v. *Joliet & Chicago R.R. Co.*).

ıuity payments received by a divorced wife in accordance with a trust
nent executed prior to a Texas divorce decree were held taxable to
vorced wife, since she did not prove that the Texas court retained the
to control the income from the annuity to require the husband to
rt his divorced wife and thereby show a continuing obligation of
rt on the husband and a consequent liability on him for the tax on
nnuity payments.



PASS IT BY OCTOBER 1, OR ELSE!
ROOSEVELT'S ANTI-INFLATION MESSAGE
LEGISLATION FOR FARM PRICE CONTROL BELOW 110 PER CENT OF PARITY
CONGRESS
9-9-42
FRED O. SEIBEL

ROOSEVELT'S "ULTIMATUM" of Sept. 7, 1942, in which he threatened to decree executive curbs on U.S. wages and prices if congress failed to enact legislation by Oct. 1: cartoon by Seibel of the *Richmond Times-Dispatch*

The credit allowable with respect to dividends received from a foreign subsidiary which had paid foreign taxes, according to the court, is the proportion of the taxes paid by the subsidiary upon its accumulated profits (from which the dividends were paid), which the amount of the dividend bears to the accumulated profits of the subsidiary, which accumulated profits are the total profits or income minus taxes (*American Chicle Co.* v. *U.S.*).

The Revenue Act of 1942.—Among the most salient provisions of the act were: *Refunds.*—A postwar refund of excess profits tax was granted for an amount equal to 10% of the excess profits tax and within three months after the tax is paid; the taxpayer to receive noninterest-bearing bonds to mature on a sliding scale in such amount, which cannot be transferred, pledged or assigned until the cessation of hostilities in the war.

Salary Limitations.—Under presidential order an employer may not pay a salary which, after reduction by the federal income taxes on the amount of such salary, would exceed $25,000. The maximum salary for 1943 under the regulations will be about $67,000, except that if an employee establishes that his income from all sources is insufficient to meet customary charitable contributions, etc., without undue hardship, he may be paid an additional amount to meet such payments. Furthermore, an additional amount may be paid him if he establishes that, after resorting to his income from all sources, he is unable, without disposing of assets at a substantial loss resulting in undue hardship, to meet life insurance premiums on policies in force on Oct. 3, 1942; required payments on fixed obligations in effect on Oct. 3, 1942; and federal income taxes for prior years, not including taxes on the limited salary allowance.

Alimony.—The new law permits a husband to deduct payments required to be made to his wife, under a decree of divorce or of separate maintenance or under a written instrument incident to such divorce or separation. Such payments will be taxable to the wife.

Amortization of Emergency Facilities.—The privilege of amortization deductions extends to individuals, partnerships, estates and trusts claiming amortization of emergency facilities, and the date of the beginning of the emergency has been changed to Jan. 1, 1940.

Pension Trusts.—Serious restrictions are imposed on deductions for payments made under stock bonus, pension, profit-sharing or annuity plans, whether in the form of trusts or in the form of payments to insurance companies. The plan must be nondiscriminatory and no deductions will be allowed the employer who has failed to meet the requirements. The act further restricts the portion of contributions that may be deductible by the employer in each taxable year. Corporations can no longer deduct in one year unlimited lump sum payments to insurance companies for annuities covering past service benefits.

Nontrade or Nonbusiness Deductions.—By amendment retroactive to all prior revenue acts, an individual could now deduct "all the ordinary and necessary expenses for the production or collection of income, or for the management, conservation or maintenance of property held for the production of income."

Relief.—Special relief is accorded to taxpayers if they prove that the excess profits tax computed without the benefit of the section is "excessive and discriminatory," that the average base period net income is not a fair measure of normal earnings and that abnormal conditions affected business during the base period, such as: That in one or more years in the base period, production, output or operation was interrupted or diminished because of the occurrence of events unusual and peculiar in the experience of such taxpayer, either during or immediately prior to the base period; or that the industry of which the taxpayer is a member was depressed during the base period because of temporary economic events unusual in such industry, and as a result the business of the taxpayer during such period was depressed; or that depressed conditions prevailed caused by temporary economic circumstances unusual in its business experience generally; or that the taxpayer, either during or immediately prior to the base period, commenced business or changed the character of the business, and so the average base period net income does not reflect the normal operation for the entire base period of the business; or because of any other factor affecting the taxpayer's business which may reasonably be considered as resulting in an inadequate standard of normal earnings during the base period. A taxpayer wishing to avail himself of this section must also prove that its application to it would not be inconsistent with the principles underlying the provisions of this subsection, and with the conditions and limitations enumerated therein.

Victory Tax.—A 5% tax assessed against all income earned beginning 1943, except that of casual, domestic and agricultural labourers. Employers must withhold the tax and remit to the treasury. (*See* also TAXATION.)

Trade Regulation.—*Antitrust.*—To prevent impairment of the war program, the antitrust division agreed to grant a stay of prosecution on the joint recommendation of the secretaries of war and the navy.

Congress enacted a law suspending the running of the statute of limitations on violations of the antitrust laws until June 30, 1945, or until such earlier time as congress by concurrent resolutions, or the president, may designate. Congress went even further, and provided that whenever, after consultation with the attorney-general, the chairman of the War Production board finds and certifies in writing that the doing or omitting to do any act is in compliance with his written request or approval and is requisite to the successful conduct of the war, no prosecution or civil action shall be commenced with reference thereto under the antitrust laws, or the Federal Trade Commission act.

But the department of justice did not relax its enforcement of the antitrust laws generally. It instituted suit against the Associated Press, charging illegal restraint and monopoly by preventing nonmember newspapers from obtaining services available to AP members. In an action brought against the Great Atlantic & Pacific Tea Co., it charged the latter with attempts to use its dominant position to destroy competition through cutting prices, offsetting local losses by price fixing in dominated areas, and securing discriminatory prices and excessive, preferential discounts and rebates under the guise of advertising allowances unrelated to services rendered.

Held conspiracies in restraint of trade were the activities of a grocery bureau and its officers and directors in disseminating to member retail grocery stores admonitions to keep prices on articles sold by them, including those shipped in interstate commerce, within a minimum markup in accordance with a so-called "gentlemen's agreement" (*United States* v. *Food and Grocery Bureau*); and the activities of medical associations in interfering with a group health association, the business of which consisted of making available and financing medical and hospital services, rendering medical service through employment of physicians, and rendering hospital service through use of hospital staff and hospital facilities (*American Medical Assn.* v. *U.S.*).

Though a patent confers exclusive right to make, vend and use a patented article, the patentee's monopoly power over the article is exhausted after the sale, and he may not control the resale price or limit the source of the goods with which the patented article may be used. And where the patentee receives a substantial reward for the patented article, he may no longer control the article regardless of the legal form of the transfer (*U.S.* v. *Univis Lens Co.; U.S.* v. *Masonite*).

Several indirect checks upon the illegal use of patents were developed in recent decisions. The court held that a defendant may assert the plaintiffs' use of the patent in tying agreements, contrary to public policy, as a valid defense in a patent infringement suit (*Morton Salt Co.* v. *Suppiger; B. B. Chemical Co.* v. *Ellis*). A licensee under a licence requiring him to conform to prices fixed by the licensor (patent holder) for sales of competing patented articles by the licensor and other licensees may contest the validity of the licence patent when sued for royalties. Such a restriction on the price of articles entering interstate commerce violates the Sherman act unless it is within the protection of lawfully granted patent monopoly (*Sola Electric Co.* v. *Jefferson Electric Co.*). But charges that the owner of patents for the manufacture and sale of computer gasoline pumps and computer mechanisms, and its licensees, conspired to fix noncompetitive prices for the sale of such devices and to monopolize the manufacture and sale thereof in interstate commerce was held insufficient to constitute a violation of the Sherman act (*United States* v. *Wayne Pump Co.*).

Business Regulation.—The supreme court continued the trend of previous terms in sustaining an increasing amount of regulation of business and industry by federal and state governments.

A broad basis for federal regulation of business was laid down by the court in its opinion that the national power of regulation extends to such control of intrastate transactions as is necessary and appropriate to make the regulation of interstate commerce effective and that competition with interstate commerce affords the basis for regulation of the intrastate activity. This rule was enunciated by the court in upholding the application of a milk marketing order of the secretary of agriculture under the Agricultural Marketing Agreement act to milk produced and sold intrastate (*U.S.*
v. *Wrightwood Dairy Co.*). The supreme court also sustained the N
Gas act as a constitutional regulation under the 5th amendment of a
ness affected with a public interest (*FPC* v. *Natural Gas Pipeline C*
265, 268). The Illinois Commerce commission was held to be w
power to order the construction of facilities by a subsidiary pipe-lin
pany which purchased from its out-of-state parent company, op
wholly within the state, and sold gas at wholesale to distributors.
the pipe-line company was engaged in interstate commerce in the pu
and sale of gas, it was held subject to the exclusive jurisdiction of th
eral Power commission under the Federal Natural Gas act (*Illinois N*
Gas Co. v. *Central Illinois Public Service Co.*).

Trade Marks and Copyright.—The right to use a name "Personal F
Co." within a given trade area was protected against a newcomer's us
(*Beneficial Industrial Loan Corp.* v. *Kline*). Thus, a transportation
pany had the right to "Greyhound" (*Greyhound Corp.* v. *Goberna*)
a circus performer was denied the use of "Lone Ranger" and "
Silver" (*Lone Ranger, Inc.* v. *Cox*). "Vanaline" could not profit
similarity to "Vaseline" (*Chesebrough* v. *Hollywood Cosmetic Mfg*
And the Coca-Cola company procured a review by the U.S. suprem
of its charge of unfair competition against a company seeking to u
word "Cola" in its trade name.

Horse-racing charts were protected by copyright laws as are any
copyrightable compendiums (*Triangle Publications, Inc.,* v. *New E*
Newspaper Pub. Co.). And the right to renew a copyright to th
"When Irish Eyes Are Smiling" was held assignable (*Witmark & S*
Fred Fisher Music Co.).

Unfair Competition.—Courts, as usual, upheld the FTC rulings
misrepresentation; *e.g.*, paper processed to simulate walnut and
Copomo wood (*Haskelite Mfg. Corp.* v. *FTC*); retailers advertis
wholesalers (*Macher* v. *FTC*).

The commission branded as misrepresentation Dr. Lyon's claim t
tooth powder is an effective antacid or will correct acid mouth, a
slogans "Do as your dentist does," "Pink toothbrush" claims and
"The product which will give a beautiful smile" are relics of an ad
ing era now past.

Claims of cigarette manufacturers, coffee processers, and dispen
headache aids, as well as the use by the U.S. Shoe corporation of th
Cross" as a trade mark, likewise were cited before the commission
Alexander Smith Carpet Co. agreed not to designate its domestic p
by oriental names.

But the Federal Trade commission could not prohibit domestic c
tions from using French or other foreign terms or words to design
scribe or refer to perfumes made or compounded in the United States
an English translation appearing in connection therewith was held er
(*Etablissements Rigaud, Inc.,* v. *Federal Trade Comm.*).

Furthermore, exclusion of evidence as to the proper standard r
for the manufacture of fruit preserves was held to constitute a de
a fair hearing before the Federal Trade commission when it cha
corporation with falsely labelling products as "preserves" or "pur
preserves" (*Fresh Grown Preserve Corp.* v. *Federal Trade Comm.*).

Unemployment Compensation.—Held employees were barbers op
under "licensing" agreements granting them the privilege of using
chairs in return for one-third of the receipts to be paid the pro
(*Tharp* v. *Unemployment Compensation Comm.*); home workers
neckwear on a piecework basis for a neckwear manufacturer (*Peas*
Murphy); firemen on a drill barge engaged in dredging operation
navigable river (*Puget Sound Bridge and Dredging Co.* v. *State Une*
ment Compensation Comm.).

Held not employees were real estate salesmen working for a bro
a commission basis (*Wilson Sullivan Co., Inc.,* v. *Miller*); insuranc
men on a commission basis soliciting policies on the same basis for
other companies at the same time (*Columbian Protective Assn.* v.

Eligible for unemployment compensation was a person who lef
to attend college, for unemployment occurring after completion of th
period (*Wyka* v. *Colt's Patent Fire Arms Mfg. Co.*).

Employees participating in a strike arising out of a labour dispu
not deprived of unemployment benefits (*Nebraska Unemploymen*
pensation Law) unless there was a substantial curtailment of work (
v. *Kinney*). But employees were disqualified for the period of un
ment caused by a work stoppage due to a labour dispute (*Deshler*
Factory v. *Kinney*). Refusal to accept a former employer's offer
employment disqualified one from receiving benefits, regardless of
status or present distance from former work (*Alabama Textile F*
Corp. v. *Dept. of Industrial Relations*).

War Regulations.—Restrictions necessitated by the all-out war eff
cerned every phase of civilian as well as military operations.

Aliens.—The activities of aliens, even though American-born of J
ancestry, were affected by the curfew laws promulgated by the com
of the coastal military defense area (*United States* v. *Yasui*). A
enemies were barred from American trade by the terms of the "
with the Enemy act, even though the stock of such corporations w
by British subjects (*Drewry* v. *Onassis*). A nonresident enemy al
held entitled to maintain a suit in a state court, but any recovery
him would belong to the alien property custodian (*ibid.*). (*S*
ALIENS.)

Communications came under rigid control, and to prevent exp
by the enemy, a severe censorship barred weather reports, and
troop and ship movements, and experiments with war equipment, e
reasons of censorship, all public domestic point-to-point radio t
circuits within the United States' continental limits were closed b
of FCC and the Defense Communications board, except coastal an
to-shore stations under navy control. FCC ordered all persons po
radio transmitters who did not hold station licences to register suc
mitters with the commission before June 28. (*See* also CENSORSHIP

Manpower.—The Manpower commission was vested with power
ing on the conscription of labour. The commission listed essentia
ties which would be granted occupational deferment. It evolved th
ning Table plan providing the basis for the withdrawal of such wo
a rate that would permit others not suitable for active service to be

eplace them. The Manning Table was a recording, with appropriate orting data, of the different kinds of jobs in a plant from the view- of the type of workers needed to fill each job; the skill, training and ience needed by such worker; and the estimated length of time required ain a replacement for each worker. The replacement schedule is the based on the Manning Tables for deferment of employees.

ice Control.—Price control gained strong impetus when OPA's general mum price regulation was sustained by an injunction against C. Thomas s, Inc., and its chief supplier, Mutual Wholesale Food and Supply Co.

tioning of consumer goods was adopted as an integral part of the fed- government's regulation of the entire American economy. This highly tial control was delegated through WPB chiefly to OPA. OPA's ration- ower expanded rapidly to affect meat, coffee, sugar, etc. Certain com- ties such as typewriters, rubber and automobiles were frozen.

tioning regulations listed numerous sanctions for their enforcement, of which were applied, and the statute provided criminal prosecution ilful violations.

Colonial Operating Corp. v. *Hannan Sales and Service,* a lower court that due to rationing of automobiles, performance of a lease of prem- o be used "only for a showroom of automobiles and automobile acces- ." had become illegal and the tenant was excused from the payment of

nt Control.—In recognition of judicial supremacy over emergency ation, a Michigan state court held that it had no jurisdiction of sum- proceedings seeking eviction for nonpayment of rent higher than the num permitted by OPA rent regulation (*Vecchio* v. *Kelly*). Nor can e court render a declaratory judgment on a landlord's rights to higher OPA-permissible maximum rent (*Diefenbaugh* v. *Cook*). Exclusive ry jurisdiction to set aside provisions of the Price Control act or ations thereunder was held to be vested by the law in the emergency of appeals (*Vecchio* v. *Kelly*).

ective Service.—Bribery of Selective Service investigator, evasion of raft and wilful neglect to report for induction were penalized as a iracy to violate the Selective Service act (*U.S.* v. *Offutt; U.S.* v. *nell; U.S.* v. *Grieme*). (*See* also SELECTIVE SERVICE.)

e Soldiers' and Sailors' Relief Act of 1940 as amended and signed by resident on Oct. 6, 1942, afforded protection to accommodation co- rs, persons serving in the armed forces of the United Nations, and es on criminal bonds; limited the amount of interest that might ac- luring the period of service to 6%, unless the soldier's ability to pay not affected; granted relief to landlords against mortgages, taxes and tional sales, where relief had been granted against them; protected ages and contracts for the sale of real and personal property if ted before entry into service, permitted a lessee to terminate his when called into military service.

nsportation.—On May 2, 1942, Executive Order No. 9150 ordered ffice of Defense Transportation to assume jurisdiction over all rubber- transportation facilities including passenger cars, buses, taxicabs and s; develop programs to facilitate such transportation; and formulate ires to conserve and assure maximum utilization of existing services. ited car-load shipments for nondefense purposes, reduced special de- es, required pooling of facilities and barred pleasure driving. (*See* DEFENSE TRANSPORTATION, OFFICE OF.)

r Labor Board.—WLB became the supreme arbiter of labour rela- assuming jurisdiction over any labour dispute that it believed within omain even though the dispute was unrelated to the war effort, and where no dispute was involved. In exercising its jurisdiction over ng contracts, WLB preferred industry-wide negotiation to individual acts. It ordered modification of a union agreement, interpreted an guous contract, directed the exclusion of certain clauses from contracts, ed a change of shifts and also permitted a dissatisfied employer to e a protest clause in the contract while disallowing a duress clause, onferred union security by granting membership clauses in contracts check-off of dues by the employer.

occasion it deferred to the National Labor Relations board when an of unfair labour practice was involved, and directed compliance with board's order where a work stoppage would interfere with the war

der presidential order, after amendment to the Price Control act (Cost ving Stabilization act, Oct. 2, 1942) WLB and the treasury were ed power over increase and decrease of wages. The board announced ion of the 15% formula (Little Steel) as the basis for granting or ng any increase under which it grants increases up to 15% over wages on Jan. 1, 1941, this percentage being the estimated rise in the cost ing between that time and May 1942. If decreases had been granted lly covering the 15% gap they had to be deducted from the total in ng at increases still available. Increases were denied where a 15% n rates since Jan. 1, 1942, had already occurred and WLB modified calator clause which would have operated to raise wages above the limit. WLB departed from the Little Steel formula and granted ses above the 15% formula only to correct inequalities and inequities. arly increases were denied in rejection of the Little Steel formula where ng wages were in excess of those paid in the area and where grant- he increase would have created an inequality.

e also WAR LABOR BOARD.)

r Production Board.—WPB substituted for the Production Require- plan, under which materials were allocated by their end use, the olled Materials plan, the purpose of which was to assure a balance en the supply and demand of the controlled materials, so that they e available to consumers in the quantity and form and at the time lace required to meet authorized programs and schedules. It provided he division of available supplies of controlled materials among the us claimant agencies in the interests of the most efficient use of the ials in war production, as well as the further division of such sup- between prime and secondary consumers.

meet military requirements and the need for assuring equitable dis- ion, newspapers and magazines were cut in their consumption of print , processed foods were placed under rationing at consumer levels and inventories of consumer goods in the hands of large retailers and wholesalers were curtailed. Only small percentages of available materials remained to be distributed, requiring that each request be weighed carefully as against the need of the war program. The inventory order, L-219, limited the size of inventories of consumer goods in the hands of large retailers, wholesalers and stock-carrying branches of manufacturers. Simplification and standardization of innumerable commodities and elimination of many others released millions of tons of critical materials for military use. (*See* also WAR PRODUCTION BOARD.)

Workmen's Compensation.—Even though a worker was engaged in maritime service within the scope of the Federal Longshoreman's and Harbor Workers' Compensation act, recovery was allowed under the Washington State statute in the absence of action by federal authorities under, and of compliance by the employer with, the provisions of the federal act (*Davis* v. *Dept. of Labor and Industries of the State of Washington*).

A state may not discriminate against a foreign corporation; hence the latter could be required to register in Pennsylvania to obtain exemption from the duty to insure employees who are subject to the State Workmen's Compensation act provided they established financial ability to pay compensation (*United Fruit Co.* v. *Dept. of Labor and Industry*).

Illness caused by drinking contaminated water furnished by the employer from the same source as that used by the hospital on whose grounds the employees were working constituted an injury arising out of employment and hence compensable under the workmen's compensation laws (*Permanent Construction Co.* v. *Industrial Comm.; Union Mining Co.* v. *Blank*). Likewise compensable under the Connecticut Workmen's Compensation act was a disability resulting from an occupational disease contracted by an employee because of his peculiar susceptibility thereto (*LeLenko* v. *Wilson J. Lee Co.*). (*See* also BUSINESS REVIEW; CONSUMER CREDIT; RELIEF.)

Lead.

Most of the figures in the accompanying world table are estimates, but they are presented as the best information available at the close of 1942. Figures carrying a decimal are reported outputs.

World Production of Lead
(In thousands of metric tons)

	1929	1937	1938	1939	1940	1941
Australia	177.3	234.4	235.7	252.4	280	315
Belgium	62.2	88.0	90.5	96.0	55	20
Canada	148.0	186.4	185.7	177.9	215	220
Germany	97.9	162.4	171.7	181.4	200	225
Burma	81.5	78.9	81.4	78.6	83	84
Mexico	248.8	231.2	242.7	215.7	196.3	155.3
Spain	133.3	30.0	36.0	27.0	56	57
U.S.S.R.	6.2	55.0	69.0	75.0	80	90
United States . .	624.2	426.3	344.4	381.4	389.2	438.2
World Total .	1,756.8	1,719.6	1,704.2	1,722.7	1,800	1,850
Ex. U.S. . . .	1,132.6	1,293.3	1,359.8	1,341.3	1,511	1,412

In the United States mine production of lead in 1941 was 461,426 short tons, and the refinery output was 470,517 tons from domestic ores, plus 100,450 tons from foreign ores, or a total of 570,967 tons. This supply of new metal was supplemented by a secondary recovery of 397,416 tons, besides imports which in the first nine months of the year totalled 260,982 tons—58,052 tons in ore, 23,631 tons in bullion and 178,179 tons of metal. The consumption of new lead was estimated at 812,970 tons, and total consumption, including secondary, at 1,050,000 tons. On the whole, the supply was fairly well maintained, in spite of increasing demands, while stocks at smelters and refineries declined during 1941 from 143,412 tons to 100,149 tons, consumers' stocks increased from 78,470 tons to 104,335 tons, leaving a net decrease of 17,398 tons, which was more than offset by a decrease of 20,276 tons in the metal in process and which is included in plant stocks, so that actually shipments by producers were slightly in excess of consumption.

Among the countries not listed in the table, Argentina produced 32,317 metric tons of 74% concentrates in 1941, while in Peru the output was 54,822 tons and in Bolivia 15,654 tons. The heavy decrease in Mexican output was largely due to labour troubles; exports to the United States were 90,116 tons in 1941.

In the first quarter of 1942 Spain produced 8,400 metric tons, 52,500 tons, and the United States reported 174,100 tons through April. (*See* also WAR PRODUCTION, U.S.) (G. A. RO.)

League of Nations.

The work of the League in 1942 was summed up by the secretary-general in his annual report: "As an active political power it has been almost nonexistent for some years; it lives, however, not only as a centre of economic, financial, social and humanitarian action and studies and as an instrument of reconstruction . . . but also as a possible agency for the resumption of co-operation between nations. The International Labor organization carries on bravely, holding its loyalties deep-rooted in organized labour and organized employers, to serve a high and valuable purpose. The Permanent Court . . . in spite of the fact that its activities are suspended, remains an organized reality, though driven by invasion from its seat at the Hague. All these organizations of the League of Nations are thus in being, ready at the appropriate moment to take their respective parts in the reconstruction of the world."

Details of this technical staff work at Geneva, still the official centre, at Washington and Princeton University, in the U.S., at McGill university, Canada, showed a remarkable record. Twenty years' experience in handling the problems of World War I was kept up to date; research work was continuous on the lessons to be drawn therefrom, on the effect of that war on current problems and above all on postwar reconstruction. A direct aim was to implement the Atlantic charter, now the common peace policy of all the allied nations, and to secure the acceptance by statesmen on both sides of the Atlantic of full responsibility for rebuilding the world on a basis of international collaboration.

The health organization at Geneva was collecting full data and making preparations to meet the menace of typhus, malaria, tuberculosis and other diseases increased by war. Standardization of vitamins continued and their distribution was successfully carried out. The Singapore bureau continued to function efficiently from an Australian base. The Central Board of Control at Washington worked out drug requirements for the world and was watching the traffic, decreased on the one hand by sea blockade, but increased on the other by the vast growth of military transport, notably in the Near East.

The economic and financial committee—in close liaison with the International Labour Office—held two sessions. Its program included publications such as *World Economic Survey*, the *Network of World Trade, Money and Banking, Wartime Rationing and Consumption,* while research on many other problems was in various stages of completion; *e.g.* commercial policies, raw materials, and the immediate relief and reconstruction needed when the war stops; problems of agriculture, currency, co-ordination of modern transport, economic depressions, social security with a special view to full employment and the just claims of the consumer, population problems.

The secretary-general, Sean Lester, said there could be no reconstruction without political security and confidence in peace. That must be followed, stated the report of the economic and financial committee, by restoration of international payments and re-opening of the multilateral channels for world trade. The general disequilibrium caused by war would need immediate remedies—for which purpose "a much larger degree of international co-operation than anything yet achieved will be necessary." For policies governments alone are responsible. But vital initial work on which these can be based was being done by the League of Nations. (*See* also DRUGS AND DRUG TRAFFIC; MANDATES; REFUGEES.) (M. FE.)

Leahy, William Daniel

(1875–), U.S. naval officer, was born at Hampton, Ia., on May 6. He was graduated from the U.S. naval academy in 1897. In 1912 he was chief of staff of the Nicaraguan occupation armies and in 1916 chief of staff in the Haitian campaign. Commissioned rear admiral in 1930, he became commander of the destr scouting force in 1931, chief of the bureau of navigation in and chief of naval operations in 1937. He was commissioned admiral in 1935 and admiral in 1936.

Upon his retirement from the navy in 1939, he was appo governor of Puerto Rico. In Nov. 1940, President Roos named him ambassador to the French government at Vichy this post, throughout 1941, Leahy succeeded in persua Pétain's government not to become totally immersed in Hi "new order." In April 1942, Roosevelt summoned Leah Washington "for consultations." Although one of the presid motives in recalling his envoy was to express disapprov Vichy's policies, his primary purpose was to appoint Leahy of staff to the commander-in-chief. Leahy was named to newly-created post on July 21, 1942.

"Lease-Lend" Act (H.R. 1776): *see* LEND-LEASE AD ISTRATION, OFFICE OF.

Leather.

The U.S. leather industry operated in 194 capacity levels in spite of the most difficult c tions it had ever experienced, and completed the year with is believed to have been the largest total output in its his Demands for military leathers and leathers for the manufa of military shoes, gloves, garments, and hundreds of other le products for war rose to all-time record proportions, while a same time there was no appreciable slackening of the abnorr high civilian demand which has prevailed for the past two y

Domestic slaughter increased in 1942 over 1941, and sup of domestic cattle hides, calfskins, kipskins, and sheep and skins were greater than in the previous year. Imports believed to have risen somewhat to supplement the dom supply, but import statistics were not available and trade mates varied greatly.

It was estimated that the total supply of the major typ raw stock, including both domestic production and imp amounted to around 24,500,000 cattle hides, 14,000,000 cal kipskins, 49,000,000 sheep and lambskins, and somewhat than 1,000,000 horse hides.

The tanning material situation was not favourable in At the beginning of the year the makers of shoe upper specialty leathers were threatened with a serious shortag chromium chemicals because of the excessive use of ch by war industries. This threat was alleviated later in the ye domestic production of chrome ore was increased and economies were effected in the use of chrome. A west tanner in 1942 obtained samples of waste anodizing liquors are discarded in large quantities by the aircraft industr ascertain whether the chromic acid in the waste could b covered and utilized in tanning liquors. Laboratory and ta tests of these liquors revealed that they possessed conside merit as a source of chrome tanning liquors. This study ha progressed far enough by the end of the year to evaluate pro the worth of the waste material as a tanning material sc

The situation in regard to other tanning materials was favourable than the chrome situation. About 65% of all table tanning materials used by tanners in the United Sta imported, and the war cut off many of the countries from these were formerly obtained, while difficulty in securing space from other countries limited imports. Such impo vegetable tanning materials as myrobalans, powdered myrob and extract, Sicilian sumac, valonea beards and cups, man bark, common gambier, Borneo cutch, and powdered va were not available, and supplies of some other important rials were limited.

Chestnut, formerly one of the biggest sources of domestic nning materials, had fallen victim to an unconquered blight, d only blight-killed trees remained as the chief source of estnut tanning extracts.

Much research was being done as a chemurgic project for e development of new domestic tanning materials. Alfred ssell, of the University of North Carolina, was studying the ra of the southern section of our country in search of new d desirable sources of tannin, and published a preliminary port showing some promising results. Government agencies re also studying the problem, and the activities of the depart- nt of agriculture were encouraging. Regional laboratories were ablished to encourage chemurgic developments, and at the stern regional laboratory at Philadelphia an extensive study domestic tannins was being made. The Tanners Council Re- rch laboratory at the University of Cincinnati also studied tain of these possibilities.

Among the most promising sources of domestic tannin at the se of 1942 were American sumac, canaigre, guayule, and the rk of the western hemlock and Sitka spruce.

The American tanning industry also made some use of nthetic tanning materials but, contrary to European practice, l not use these as true, complete tannins, but only as tanning ls or assistants. These synthetic agents are customarily ob- ned from industrial wastes, such as the phenols or naphthalene stes. It was believed that many other wastes could be similarly d to advantage.

One waste material thus used in increasing quantities was the ste sulphite liquor of the paper pulp industry. This liquor ntains solubilized lignin, the non-cellulosic part of wood. Lignin also a waste in such materials as straw or corn stalks.

A serious shortage confronted the tanning industry in 1942 a number of fats and oils used in leather manufacture. Several the oils which were most generally used before World War II re in 1942 unavailable or excessively high priced, and other s were substituted for these.

The nation's supply of leather raw stock, leather and finished ther products was protected through the year by a number government regulations.

In April the War Production board issued Order M-80 and sumed control of 80% of all available outsoles and insoles of litary grade and weight. Under a later amendment, the WPB dered the entire stock and production of heavyweight sole thers set aside for military and lend-lease production. Still er amendments tightened further the WPB's control of sole ther and in August the WPB ordered tanners to set aside a rcentage each month of heavier weights of manufacturers' pe sole leather, after military requirements were met, and to ake this leather available to shoe repairers. (Manufacturers' pe sole leather is used by shoe manufacturers and is a softer nnage than that of finders' sole leather which is used by shoe pairers.)

The WPB in April amended General Imports Order M-63 to quire importers of foreign hides to secure permits from the efense Supplies Corp. and to present firm offerings and firm ds before the transaction goes through. A month later the PB added many types of hides and skins to the list under neral Imports Order M-63 which require permits for im- rtation. Still later the WPB included hides and skins in a list 500 import items guaranteed preferential treatment in shipping ace assignments.

The entire supply of domestic cattle hides, calfskins, kipskins, d buffalo hides was placed under control of the WPB by der M-194, issued in July, and deliveries were made to tanners der a permit system designed to insure equitable allocation of hides and skins to increase the production of leather of suitable quality for military purposes and to direct hides from non-essential civilian uses into essential civilian uses.

Conservation Order M-265, issued by the WPB in November, restricted to military and lend-lease products the cattle hides, goatskins, kidskins, calfskins and kipskins used in the manufacture of garment leather. Horse hides were also brought under the control of the WPB through Order M-141, issued in May. The order gave the WPB complete control of all horse-nide fronts suitable for gloves, jackets, windbreakers and other military leather garments. It was amended in November to place quota restrictions also on the processing of fronts, butts and shanks.

In March the WPB placed restrictions on the processing of raw goat, kid and cabretta skins and provided for production on a monthly quota basis. It was also ordered that any skins which could be processed to more than 5¾ ft. be reserved for military use; this requirement being eased somewhat by an amendment issued Dec. 31.

Numerous regulations affecting shearlings, moutons and wool skins were issued during the year. All shearlings except grade 4 could be processed and sold only to fill orders placed by the army air forces, and the entire production and inventories of shearlings must be submitted to the AAF for inspection and grading.

Statistics of the extent of the foreign trade of the industry in 1942 were not available under censorship. However, it was known that large quantities of leather were exported for lend-lease account and large quantities of raw stock were imported to provide materials for American tanneries. (*See* also SHOE INDUSTRY.)

Lebanon.

Independent republic, formerly French mandated territory, bordering the eastern Mediterranean. Area 3,475 sq.mi.; pop. (est.) 900,000; chief town: Beirut (cap. 180,000). President (1942): Alfred Naccache. Language: Arabic; religion: mainly Mohammedan.

At the end of Dec. 1941 King George VI sent a message of good wishes to the president of the Lebanese republic, constituting full recognition by the British government of the independence of the Lebanon. Letters of credence were presented by Brig. Gen. Spears, as first British minister, on March 27 and George Wadsworth, first United States representative, as consul-general on March 21. Allied victories in North Africa in November resulted in the reduction of hoarding. At Beirut between Nov. 1–9 the price of white flour fell from 195 to 160 piastres a kg., wheat from 130 to 105 piastres and the sovereign from 42.60 to 36 piastres.

For financial, trade and agricultural statistics, *see* SYRIA.

Ledochowski, Vladimir

(1866–1942), Superior General of the Society of Jesus, was born Oct. 7 in Lower Austria. A nephew of the late Cardinal Ledochowski, he was educated for the clergy, studied at the Tarnow seminary in Poland and at the Germanicum in Rome. He took his final vows in the Society of Jesus in 1901. He became provincial for Poland, 1902, and assistant of the German Assistancy, 1906. As Superior General of the Society of Jesus, 1915–42, he doubled the membership of the Jesuits and increased their provinces and missions. Father Ledochowski worked for unity in the Christian Church and for collaboration between the occidental and oriental churches. He established missions through the orient, where he tried to organize the native clergy. He bitterly opposed the German invasion of Poland in 1939 and condemned nazi atrocities in Europe, especially in Poland. Father Ledochowski died at the Borgo Santo Spirito, headquarters of the Jesuit Society in Rome, Dec. 13.

Lejeune, John Archer

(1867–1942), U.S. marine corps officer, was born Jan. 10 in Pointe Coupée parish, La. He was graduated from Louisiana State university, 1884, and from Annapolis naval academy, 1888. He was commissioned as lieutenant of the marine corps in 1890, saw active service off Cuban shores in the War of 1898, and commanded a marine battalion in the Panama revolt, 1903–04. He was colonel during the Mexican crisis in 1914 and led a marine brigade that battled its way into Veracruz. During World War I he was made a major general, July 1918; in the same month he led the 2nd division, composed of marine and regular troops in offensive operations in St. Mihiel, Champagne, the Meuse-Argonne, and crossed the Meuse on the eve of the Armistice. He was given command of the marine corps in 1920 and supervised the operations in the Nicaraguan campaign, 1928. Gen. Lejeune retired in Nov. 1929 and was superintendent of the Virginia Military institute, leaving that post in 1937. He was decorated several times for valour and was promoted to rank of lieutenant general in April 1942. He died in Baltimore, Nov. 20.

Leland Stanford Junior University: *see* STANFORD UNIVERSITY.

Lemons and Limes.

The United States lemon production is entirely in California, where the 1942 crop was 13,650,000 boxes of about 76 lb. net, as estimated by the department of agriculture Dec. 1, 1942. Production in 1941 was 11,753,000 boxes. In 1940 it was 17,236,000 boxes, and the ten-year (1930–39) average was 8,815,000 boxes.

Limes are produced, in the United States, only in Florida. The 1942 crop was estimated at 175,000 boxes, compared to 150,000 boxes in 1941 and a ten-year average of 37,000 boxes.

(S. O. R.)

"Lend-Lease" Act: *see* LEND-LEASE ADMINISTRATION, OFFICE OF.

Lend-Lease Administration, Office of.

The lend-lease act, passed by the U.S. congress after almost two months of continuous hearings, was approved by President Roosevelt March 11, 1941. The act empowered the President to provide goods and services to those countries whose defense he deemed vital to the defense of the United States. Lend-lease goods began to move immediately after passage of the act, even though the first lend-lease appropriation act was not passed until March 27, 1941.

The Office of Lend-Lease Administration, as a central administrative and policy-making organization, does no actual purchasing. Procurement is handled through the agencies which purchase for the U.S. government and armed services, so that competition between lend-lease procurement and other procurement is reduced to a minimum. These procurement agencies are the war department and navy department for military and naval items, the maritime commission for merchant ships and ocean transportation, the department of agriculture for foodstuffs and other agricultural products, and the procurement division of the treasury department for industrial raw materials and other items.

The lend-lease act provides that the president shall report to congress every 90 days as to the status of operations under the act. The seventh such report was issued as of Dec. 11, 1942. Up to Dec. 1942, a total of $18,410,000,000 had been appropriated to the president and, in addition, the transfer had been author
of goods and services to a total of $35,970,000,000 from ap
priations to the war and navy departments and maritime c
mission, not including the value of ships which may be leased

After Pearl Harbor, the lend-lease program was integrated w
the nation's over-all war effort. Combined agencies were est
lished in Jan. 1942 to co-ordinate strategy and map the proc
tion of munitions and raw materials. The needs of U.S. allies w
balanced with the needs of the growing forces of the Un
States. For example, the percentage of U.S. tank produc
allocated to a given theatre of war is determined by the imp
tance the combined chiefs of staff place upon that theatre.
plementing such decisions, lend-lease aid was being provided
in 1942 at a rate amounting to approximately 15% of total U
war production.

The value of lend-lease goods transferred and services rende
from the beginning of the program to the end of Jan. 1
amounted to $8,935,000,000. Goods transferred comprised 8
of this amount and services rendered 20%. Goods transfer
consisted of (a) military items such as planes, tanks, guns
ammunition; (b) industrial materials such as steel, petrole
products and machine tools; and (c) agricultural commodit
including principally foodstuffs. For the year 1942, military it
comprised about 61% of total transfers, industrial materials 2
and foodstuffs 16%.

Services rendered in 1942 included principally the repair
ships of the United Nations, the provision of the necessary s
ping to carry goods to lend-lease countries, new factory and s
yard facilities built in the United States for the production
lend-lease goods, supply services performed in the base a
throughout the world, and the training of United Nations
forces.

In 1942, roughly one-third of lend-lease exports were going
the United Kingdom, one-third to the U.S.S.R. and one-third
the middle and far east, Australia and other areas.

Following are the nations to which lend-lease aid could
provided at the end of 1942: Argentina, Belgium, Bolivia, Bra
the British empire, Chile, China, Colombia, Costa Rica, Cu
Czechoslovakia, Dominican Republic, Ecuador, Egypt, El Sa
dor, Ethiopia, France (Fighting French), Greece, Guatem
Haiti, Honduras, Iceland, Iran, Iraq, Liberia, Mexico, the Net
lands, Nicaragua, Norway, Panama, Paraguay, Peru, Poland, T
key, U.S.S.R., Uruguay, Venezuela and Yugoslavia.

In 1942 the program of reciprocal lend-lease became a mate
aspect of the U.S. supply problem. Large numbers of Ameri
troops overseas were being provided, under reciprocal lend-le
with services and materials ranging from repair facilities, tra
portation and housing to food, uniforms and ordnance. This
formal pooling of resources was made formal on Sept. 3, 1942
the signing of agreements with the United Kingdom, Austra
New Zealand and Fighting France. (*See* also AGRICULTU
BUSINESS REVIEW; TARIFFS.)

(E. R. Ss.

Lepidolite: *see* LITHIUM MINERALS.

Leprosy.

The war in the Pacific brought under Japan
control the leprosy hospitals and asylums in
conquered countries. The fate of lepers and the progress
leprosy in these regions would not be known until the end
the war. The literature from the other parts of the world
which leprosy is endemic revealed little progress.

The diphtheria antitoxin and toxoid treatment of leprosy
favourably reported from Thailand in 1940 was not found be
ficial by leprologists in other countries. A number of caref
controlled clinical trials were made but practically all invest

. TRUCKS LOADED WITH LEND-LEASE SUPPLIES for the U.S.S.R., on a

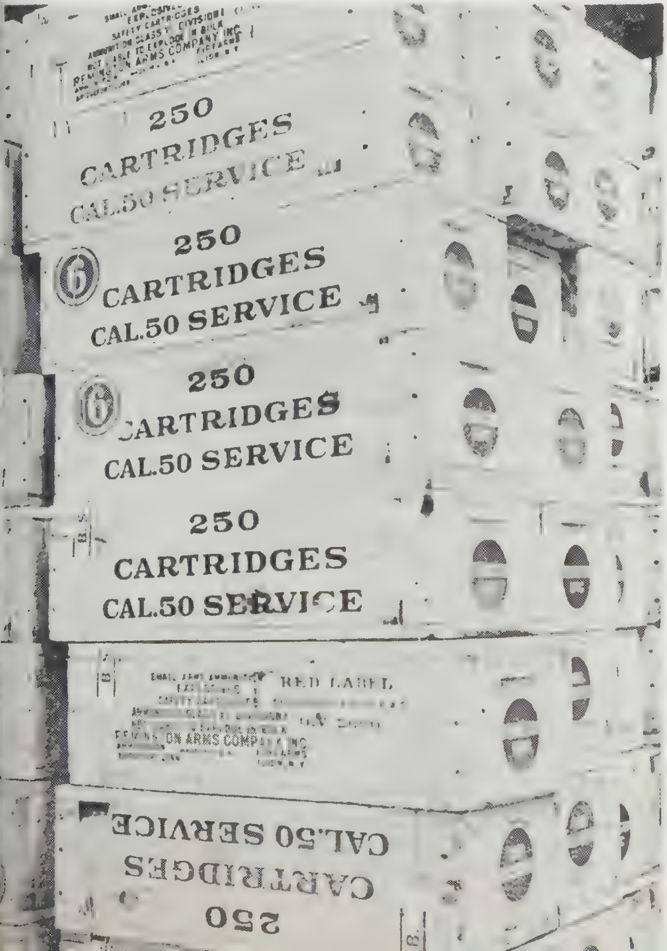
nt at an Atlantic port in 1942



TRUCK CABS and drums of aviation gasoline awaiting lend-lease shipment from an Atlantic port to the middle east in 1942

A BOMBER TIRE and crate of aircraft parts at a U.S. port ready for shipment to the U.S.S.R. in 1942 under lend-lease agreements

tors observed the treatment to be of no value. Reports were made from India, China, South Africa, Philippines, South America and the United States.

After 1916, leprologists used an intracutaneous skin test (lepromin or Mitsuda test) which was useful in separating cutaneous from neural leprosy. A crude suspension of heat-treated macerated leprous nodules was originally employed. Disadvantages of the test were the impossibility of standardizing the dosage and the interval of several weeks required for a nodule to develop in patients giving positive reactions. In attempting to correct these drawbacks an investigator, by means of chloroform extraction, obtained from leprosy nodules a practically pure harvest of leprosy bacilli. Relatively pure protein fractions of the bacilli were then prepared. Using this purified inoculum for intracutaneous tests a standard dosage was possible and the "reactors" responded within two or three days with a tuberculinlike skin reaction.

In areas where leprosy is relatively rare, cases frequently are far advanced before the true diagnosis is obtained. Of 425 lepers at the Leprosorium, Carville, La., 154 (36%) were diagnosed as and treated for syphilis by the physician who first saw them. Positive Wassermann or Kahn reactions were reported in 238 (56%) of these patients.

Lettuce. Production of lettuce in the United States in 1942 was 23,858,000 crates, compared with 23,042,000 crates in 1941 and a ten-year (1931–40) average of 19,979,000 crates. The planting in 1942 was 156,490 ac., compared with 156,980 ac. in 1941 and a ten-year average of 156,010 ac. The acreage of early lettuce in 1942 was 38,300 ac. compared with 36,500 ac. in 1941. The department of agriculture in announcing vegetable goals for 1943 asked that planting of early lettuce be reduced 34,850 ac.

Levi-Civita, Tullio (1873–1942), Italian mathematician, was born March 29 in Padua, Italy, and was educated at Padua university. He was professor of rational mechanics at the University of Rome, 1919–38, and was one of the two European mathematicians invited to lecture at the Chicago World's fair in 1932. Prof. Levi-Civita, regarded as one of Italy's greatest mathematicians, was a disciple of Albert Einstein and had made important contributions in the fields of hydrodynamics, theoretical dynamics and pure geometry. In 1938, when Mussolini decided to follow Hitler's anti-Semitic policies and "cleanse" Italy of Jewish elements, Prof. Levi-Civita was disbarred from the Real Accademia dei Lincei in Rome, on "racial grounds." The Vatican, however, showed its disapproval of the new racial laws by inviting the "outcast" mathematician to the scientific congress called by the Pontifical Academy of Sciences in 1940. Prof. Levi-Civita was the author of *The Absolute Differ tial Calculus* (1927) and *Three Lectures on Mathematical S jects* (1938). His death was reported in an official broad from Vatican city, Jan. 1.

Libel: *see* LAW.

Liberal Party. The Liberal Party Organization—so-cal to distinguish it from the Liberal Nation ists who adhere to the coalition government—scrupulously served the electoral truce. This was an arrangement by which other parties did not contest the candidature, at a by-election a member of the party which last held the seat. The truce p vented by-elections from being, as they normally are, indicati of the movement of political opinion in the period between g eral elections, and some dissatisfaction was expressed with results. On balance, however, the advantages of maintaining pact for the duration were accepted, and partisan propaga was thus virtually at a standstill. At the party's annual assem in September, however, an extensive program of internatio policy and domestic reform was discussed and agreed.

Among these the most outstanding was the future of the r tions between state and industry. It was recognized that m of the controls now exercised by government over industry social life would have to be retained after the war, if only order to prevent inflation and ease the transition to peace co tions. But it was apprehended that in certain areas of the ind trial field state control or supervision would become a pern nency; and the case for this change, and its limitations, w being investigated on the basis of the inquiry conducted by Temporary National Economic committee in the United States America.

A question of importance to this small party was electoral form. The number of seats which it occupied in the house commons was entirely disproportionate to the strength of its lowers in the country; and there was a growing agitation for a system of voting which would ensure a more equitable r resentation and (b) the abolition of certain electoral practi which unduly favour wealthier candidates. (Me.

Liberia, the only completely Negro country in the wo is situated on the west coast of Africa, bounded Sierra Leone on the northwest, by French West Africa along hinterland and east sides. Area, *c.* 46,000 sq.mi. Pop. (es 2,000,000. Capital city, Monrovia (est. pop., 10,000). Presid in 1942, Edwin J. Barclay. Language: official, English; tri tongues in hinterland. Religion: Christian (Protestant).

History.—The year 1942 saw this small Negro republic c to the fore as a place of strategic importance in the war. T important United States air bases and several smaller ones w established and became vital links in the ferry service delivering war planes from Brazil to Africa, the near e U.S.S.R., India and China. Whole villages sprang up arou these bases in 1942, with offices, repair shops for planes, barra for passengers and crew, and hospitals staffed with U.S. wh doctors and nurses.

On June 17, 1942, an American expeditionary force of consid able size landed in Liberia, in accordance with an agreem between the Liberian government and the United States gove ment. Many of these troops and technicians were Negro. T United States thus assumed a virtual military protectorate o Liberia for the duration of World War II. Roads were b between strategic points, and air service was established fr county to county. German traders and the consular staff w asked to leave the country. A U.S. military adviser was put mmand of the small Liberian militia, and medical experts m the United States tackled the problem of eliminating larial mosquitoes and tsetse-flies.

Education.—In 1942 there were about 100 schools, mostly ele- ntary. Leading institutions are the College of West Africa and beria college, both in Monrovia.

Banking and Finance.—Revenues in 1941 were $1,166,694. e foreign funded debt on Sept. 30, 1942, was $1,303,000; the ernal floating debt $161,516. Public debt, about $1,500,000. rrency: the Liberian dollar equal to the U.S. dollar in value, h exchange rate fixed at $4.80=£1 sterling. Chief bank: Bank Monrovia, controlled by the Firestone company.

Trade.—Overseas trade was largely limited in 1942 to the ited States and was greatly reduced because of shipping re- ictions. Imports in 1941 were valued at $3,291,967 and exports $4,987,763. Chief exports (1942): rubber (88%) from Fire- ne Plantations company at Marshall (75,000 ac. under culti- ion in 1942), gold (10%), piassava (1%), all others 1%. nsiderable gold was mined in 1942, surpassing all previous rs. The financial adviser to the government is appointed by president of the United States according to a loan agreement. viser in 1942: John Dunaway.

Communications.—There is a government-owned radio sta- n in Monrovia. Motor roads in 1942 totalled about 250 mi. ere were no railroads in 1942. Air service between counties was ablished in 1942. There were no harbours in the country.

(J. H. Fy.)

berty Ships: *see* Shipbuilding; Shipping, Merchant rine; United States.

braries. Perhaps the most serious problem in 1942 was the increasing difficulty of filling library staff vacan- s. Men, from trained specialist to janitor, were serving in the ned forces, and both men and women, particularly in the cleri- grades, left library positions for work in industry or in the ernment service.

The 1941–42 report of the board of education for librarianship .L.A.) listed 32 accredited schools of various types as meeting standards; all were connected with teaching institutions. The al enrolment March 1, 1942, was 1,677, including 152 advanced 210 special or nonmatriculated students. This was a decrease 250 as compared with 1941. A further decrease is anticipated 1942–43.

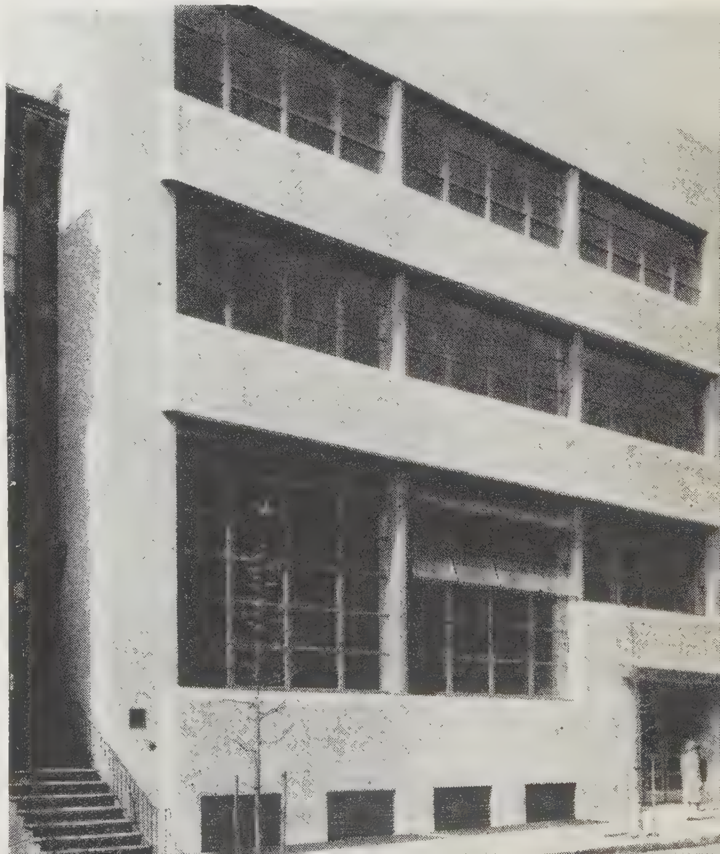
Some libraries reported decreased use, largely owing to less employment throughout the U.S. and to the withdrawal of ny men from civilian life, but increased demands were made many libraries in industrial areas, especially for scientific and hnical books. The effect of the war on college libraries could be foreseen. That libraries are essential in total global war mitted of little argument. War information centres were estab- hed. The resources of university and research libraries in many ds were utilized. Good books that would help in understanding problems of war and peace were wanted. The value of read- for recreation was not overlooked. American librarians were ing their best to meet these needs.

Between Jan. 12 and March 12 the "Victory Book Campaign" lected 6,408,804 volumes to supplement the collections pro- led by the army and navy. Of these only 3,845,283 were suited the needs of the armed forces.

In view of possible bombing many libraries removed valuable oks and records to places of comparative safety. The micro- ming of important card catalogues was considered. The National Resources Planning board issued a manual, *Protection of Cultural Resources against the Hazards of War.* The publication of the *Guide to the Reference Collections of The New York Public Library,* the studies undertaken by the A.L.A. Resources board, the discussion of plans for more effective specialization and co-operation, directed attention to the part that American research libraries would be called upon to play in postwar reconstruction, and to the place that they would occupy in the world of scholarship when peace was again established. The Association of Research Libraries successfully initiated plans for the reprinting in book form by photo offset process of the author catalogue of the Library of Congress. The advantages of having the printed cards in book form were many and the savings to libraries maintaining depository catalogues were considerable. The Biblioteca Benjamin Franklin established in Mexico City as a centre of information about American institutions was dedicated on April 13. The Rockefeller foundation and the Carnegie corporation continued their generous support of library activities in many fields. The Carnegie grant ($55,800) for the development of libraries in technological colleges, the second Rockefeller gift ($60,000) for the purchase of scholarly American periodicals for libraries in war areas in Europe and Asia, and a Rockefeller grant for the microfilming of Canadian newspapers and other historical documents, were worthy of special mention.

No important library building was completed in the period under review, but the dedication in Dec. 1941, of the Joint University library in Nashville marked a significant development in library co-operation. The new library, jointly owned and directed, served the George Peabody College for Teachers, Scarritt college and Vanderbilt university.

Size of Collections or Statistics of Libraries.—Nineteen libraries in 1941 contained more than 1,000,000 volumes each: the Library of Congress, 6,102,259 volumes (June 30, 1940); the New York Public library, 4,351,136 volumes (comprising reference department 2,831,334 volumes; circulation department, 1,421,004 volumes; and Municipal Reference library, 98,798 volumes) (Dec. 31, 1941); Harvard university, 4,265,729 volumes (June 30,



DITION to the 135th street branch of the New York public library, opened y 28, 1942. This is the Negro branch of the library

VICTORY BOOK rallies were held daily on the steps of the New York public library Jan. 19 to 31, 1942. About 600,000 books were donated to the U.S. armed services during this two-week period

1941); Yale university, 3,074,817 volumes (June 30, 1941); Cleveland (Ohio) Public library, 2,112,129 volumes (Dec. 31, 1940); Chicago (Ill.) Public library, 1,892,016 volumes (Dec. 31, 1940); Columbia university (New York city), 1,844,611 volumes (June 30, 1941); Boston (Mass.) Public library, 1,704,729 volumes (Dec. 31, 1939); Los Angeles (Calif.) Public library, 1,641,195 volumes (June 30, 1940); University of California, 1,501,473 volumes (comprising 1,124,858 volumes at Berkeley and 376,615 volumes at Los Angeles) (June 30, 1941); University of Chicago 1,330,152 volumes (June 30, 1941); Carnegie Library of Pittsburgh (Pa.), 1,319,610 volumes (Dec. 31, 1940); Cincinnati (Ohio) Public library, 1,292,472 volumes (Dec. 31, 1940); University of Illinois, 1,262,046 volumes (June 30, 1941); Brooklyn (N.Y.) Public library, 1,170,280 volumes (June 30, 1940); University of Michigan, 1,134,052 volumes (June 30, 1941); Cornell university (Ithaca, N.Y.), 1,094,117 volumes (June 30, 1941); University of Minnesota, 1,061,965 volumes (1940); Detroit (Mich.) Public library, 1,012,328 volumes (June 30, 1940). Two university libraries, Princeton and Pennsylvania, and two public libraries, Milwaukee and St. Louis, have more than 900,000 volumes each.

These figures were very uncertain standards of comparison because of differences in methods of counting and because public libraries with many branches contained many copies of new and standard books.

Librarians.—Louis R. Wilson, dean of the graduate library school of the University of Chicago since 1932, retired Sept. 1, and was succeeded by Carleton B. Joeckel, professor of library science in the university. M. Llewellyn Raney, director of the University of Chicago libraries since 1927, and formerly librarian of the Johns Hopkins university, retired Oct. 1, and was succeeded by Ralph A. Beals, assistant librarian of the Washington, D.C., Public library. George B. Utley, librarian of the Newberry library (Chicago) for 22 years, and sometime secretary of the American Library association, retired on Sept. 1. Stanley M. Pargellis, assistant professor of history at Yale university, was appointed to the librarianship. Judson T. Jennings, librarian of the Seattle Public library from 1907, retired on June 1. His successor was John S. Richards, formerly associate librarian of the University of Washington. Wilson, Utley and Jennings were ex-presidents of the American Library association.

Beatrice Winser, a member of the staff of the Newark (N.J.) Free Public library for 53 years, and librarian since 1929 (in succession to the late John Cotton Dana), retired on Aug. 31. Frank Weitenkampf, first chief of the prints division of the New York
Public library, retired on June 30 after a service of over 60 yea
to one institution. The growth of the print room since its esta
lishment, the notable series of exhibitions arranged during
long curatorship, and his numerous writings in the field of t
graphic arts were a distinct contribution to New York's artis
life. Ernestine Rose, widely known for her work with Negroes
the 135th st. branch of the New York Public library, retired
June 1, after 22 years as branch librarian.

Arthur E. Bostwick, librarian of the St. Louis Public libra
from 1909 to 1938, then associate librarian, died on Feb.
Frederick W. Ashley, who retired in 1936 as chief assistant
brarian of congress, died on June 14. A member of the staff
the Library of Congress since 1900 he had served as superint
dent of the reading rooms from 1915 to 1927. Peyton Hunt,
brarian of Williams college, died on Jan. 23 after a long illne
Sarah B. Askew, secretary and librarian of the New Jersey Pub
library commission since 1905, died on Oct. 20.

Herman H. Henkle, director of the school of library science
Simmons college, Boston, was appointed director of the proce
ing department of the Library of Congress. Robert A. Mil
was appointed director of libraries at the University of India
(Bloomington) March 1. Harold F. Brigham, librarian of
Louisville (Ky.) Public library since 1931, became director
the Indiana state library Sept. 1. Walter T. Brahm was ma
state librarian of Ohio in succession to Paul A. T. Noon, resign
June 15. (*See* also AMERICAN LIBRARY ASSOCIATION; CATHO
LIBRARY ASSOCIATION; SPECIAL LIBRARIES ASSOCIATION.)

Great Britain.—Happily, 1942 saw little increase in the da
age caused by the air raids of 1940–41, although it must
recorded that the fine City library at Exeter was almost co
pletely destroyed. This freedom from air attack on a large sc
in 1942 provided an opportunity for repairing the damage
many places and not only was it found possible to reopen a nu
ber of buildings, but many new service points were establish
This development of the library services was remarkable becau
owing to the call-up for military service of both men and wom
staffing problems became much more acute, and, in addition,
shortage of new books and binding materials, consequent up
the wholesale destruction of publishers' stocks through ene

ction and the limitation of supplies, increased the anxieties of ll who were endeavouring to maintain an efficient service to meet he needs of an ever-widening circle of readers. "Busier than ver before" was the common report from libraries throughout he country. Remarkable, too, was the fact that two towns, windon and Barnes, in which previously there had been no pubc library service, took steps to establish one. An outstanding eature of the year was the publication, in the autumn, of a reort by Lionel Roy McColvin, F.L.A., city librarian of Westninster, entitled *The Public Library System of Great Britain: a eport on its Present Condition with Proposals for Post-war Rerganization.* This report, published by the Library association, ritically surveyed the existing position and also contained a plan f reconstruction. Lillie, Gordon W. ("Pawnee Bill") (1860–1942), U.S. frontiersman and showman, was born eb. 14 in Bloomington, Ill., the son of a miller. In his youth, he oined an outfit of trappers and hunted buffalo in the western rairies. In 1882, he entered the government's Indian service at Pawnee, Okla., and in 1888, he campaigned to open the Oklahoma erritory to the small farmers. The following year he organized he "Oklahoma Boomers" and led them in the land rush of 1889. A contemporary of Buffalo Bill Cody, Wild Bill Hickok and Bat Masterson, "Pawnee Bill," as Lillie was known in the frontier terriory, entered the show business with Buffalo Bill and made a comfortable fortune in the early 1900s. Lillie died in Pawnee, Feb. 3.

Lime. Production of lime in the United States in 1941 increased 24% over 1940, to 6,078,416 short tons, another new record high. Of the total, 74% was quicklime and 26% hydrated lime; agricultural uses took 6%, building 18%, metallurgical uses 22%, chemical uses 36% and refractory uses 18%.

Canadian production totalled 860,885 short tons in 1941, an increase of 20% over 1940; 84% of the total was quicklime and 16% hydrated lime; 87% of the output was used in the chemical industry. (G. A. Ro.)

Limes: *see* Lemons and Limes.
Limestone: *see* Stone.

Linen and Flax. By the close of 1942, the United States was producing about half the flax fibre needed for coarse linen goods and none of the quality required for fine goods. Coarse goods include fish nets, cordage and bottom rugs. There was marked progress in the campaign to encourage flax production in the United States and the Textile Foundation and National Bureau of Standards, in Washington, announced a survey on the structure and composition of the flax fibre and the mechanism of present methods of preparation to make possible certain technical improvements in the spinning of domestic flax that would encourage further production and use. In Providence, R.I., a new processing company installed machinery brought from Ireland for spinning the domestic product.

Canada also took an active part in building up flax processing. Five flax factories were established in Quebec during 1942, and a flax fibre administrator was named, Nelson Young, to direct the processing of flax production in the dominion and to allocate flax and tow requirements of Canada and the United States from Canadian sources as far as possible. Regulations of grading were established by the Plant Products division, of the department of agriculture at Ottawa.

Ireland's 1942 flax cultivation embraced an area of between 20,000 and 21,000 acres, compared with only 16,000 in 1941 and 10,000 in 1940. Farmers were being urged to make their 1943 acreage 100,000. Prices were fixed by agreement with the British, who were to pay not less than 1942 prices for duration of the war and one year thereafter. Prices ranged from *21s. 6d.* to *26s. 6d.* per stone (14 pounds) of retted scutched flax, according to grade. A new type of binder twine from flax was the product of a Kildare factory established in 1942, to spin the flax grown on about 1,000 acres specially planted for the purpose in counties Carlow, Kildare, North Wexford and Wicklow.

Switzerland was a new source of flax interest in 1942. The total area under cultivation was reported as 150 hectares in 1942, as compared with 77 hectares in 1941 and 15 hectares in 1940.

Other production on the continent was reported from Denmark and France. Efforts made by the government to increase acreage in Denmark from 6,000 hectares to 8,000 in 1942 were unsuccessful. Extensive improvements in machinery during the winter of 1942 increased the capacity of flax processing factories so as to require the yield of at least 8,000 hectares. In France, the area in 1942 under cultivation was reported to be from 40% to 50% higher than 1941. This would indicate a 1942 crop from 80,000 to 85,000 acres. Germany also claimed to have developed a process for manufacturing cellulose and staple fibre from flax scraps. The woody parts of flax stems, waste after retting, were treated by an alkali sulphate process. About 150,000 tons of waste were reported available annually.

Australia was well satisfied with the 1941–42 yield of 12,000 tons of flax straw from 8,000 acres. Four new scutch mills in South Australia began operations early in 1942 on the country's first large-scale flax crop. More than 1,300 tons of fibre and tow were produced in New Zealand and all except 100 tons were exported. About 100 women and 800 men were employed in 17 flax factories. (I. L. Bl.)

Lions Clubs, International Association of. The International Association of Lions Clubs was formed in Chicago, Ill., on June 7, 1917, and founded by Melvin Jones. It is an association of service clubs whose membership is made up of business and professional men. In 1942 there were approximately 4,300 Lions clubs in 11 countries: Canada, China, Colombia, Costa Rica, Cuba, El Salvador, Guatemala, Honduras, Mexico, Panama and the United States. The total membership was 150,000. The 1942 annual international convention was held in Toronto, Can.

Lions clubs are nonpolitical, nonsectarian. Their purpose is to

THE LAST FLOW OF WHISKY from a large distillery in Louisville, Ky. By order of the War Production board, 80 U.S. plants stopped all manufacture of whisky Oct. 8, 1942, to make alcohol for war uses

recognize community needs, meet those needs by independent effort or through co-operation with other agencies, and to do everything possible to help the United Nations win the war. Their activities have eight classifications: Boys and girls; citizenship and patriotism; civic improvements; community betterments; education; health and welfare; safety; sight conservation and blind. Each classification of activities is supervised by a club committee. From May 1, 1941 to April 30, 1942, 64,995 separate activities were reported by Lions clubs to their international office. The *Lion Magazine,* the official publication of the association, is issued monthly. Edward H. Paine of Michigan City, Indiana, was international president for the 1942–43 fiscal year. Headquarters which were in 1942 at 332 South Michigan avenue, Chicago, Ill., were directed by Melvin Jones, secretary-general.

(M. Jo.)

Liquor Control.

In the United States there were in 1942 approximately 280 distilleries, 600 breweries, 1,100 wineries, 250 rectifiers, 14,000 wholesalers and 309,000 retailers. An estimated $3,000,000,000 was spent annually by the liquor industry, $1,000,000,000 for taxes and licences, $1,000,000,000 for wages and salaries and $1,000,000,000 for raw materials and operating expenses. In 1942, total government revenues derived from the liquor industry approximated $1,800,000,000.

Federal, state and local government agencies all played a part in liquor control in 1942. Revenues were derived from taxes, licences and import duties. Liquor, as generally defined, includes spirits, wine, beer and alcohol. Federal control in 1942 consisted of levying excise taxes on liquor, duties upon imports of alcoholic liquor, the setting up of standards of identity for various types and kinds of liquor, and the regulation of liquor advertising and labelling of containers. In addition, the federal government issued basic permits to distillers, manufacturers (although not to brewers), and to distributors of liquor. No fee was required for the issuance of a basic permit.

Plans for distilleries, rectifying plants, etc. had to be submitted and approved. The government also issued permits to properly qualified warehouses, in which the bottling is done under government supervision. When whisky is 100 proof (50% alcohol), has aged for at least four years, and is bottled under government supervision, affixation of a stamp is required, which declares that the whisky has been "bottled in bond," a term considerable sales potency in the liquor market.

The provisions of the Food and Drug act, passed in 19 were held by the courts to include liquor. The quality of the gredients of all alcoholic liquors was required to undergo spection; statement on the label of alcoholic content was requi Regulations concerning advertising and labelling (and this app to spirits, wine and malt beverages) were set out in great det Statement of age, except in the case of beer and wine, was a required.

The commissioner of internal revenue also issued deta regulations. Whisky could not be sold in bulk to a retailer. O a rectifier, distiller, or holder of a government warehouse per could bottle whisky. Every wholesaler and every retailer had purchase a federal occupational tax stamp. This was for reve purposes only, and no inquiry was made as to the qualificati of the purchaser, or the possession of state or local licen

Finally, the federal government levied heavy taxes on all fo of alcoholic liquor, not only at the time of manufacture, also, when there was a change in rate, upon the stock on h of all concerned in the manufacture, distribution and sale (fl tax).

The income from federal taxes on alcoholic liquor rose stea after 1933. In 1941 it was as follows: From excise ta $927,000,000; from special and occupational taxes $30,000,0 and from import duties $11,000,000. The liquor industry first as a producer of revenue. Increase in revenue came fr increase in rates, and not from increase in volume sales. Howe increase in rates seemed to have little effect upon per ca consumption.

The administration of the federal liquor laws in 1942 was the hands of the Federal Alcohol Tax Unit, a branch of United States treasury. The country was divided into distr and offices were maintained in the principal cities. These off had been highly effective in running down bootleggers, il stills, moonshine joints and other offenders against the fed liquor laws. The number of illegal stills and the number arrests for violations was quite low in 1942. Wartime restrict upon the sale of sugar made it exceedingly difficult in 1942 get this necessary commodity for illegal stills.

State Administration of Control.—The 21st (repeal) ame ment left large powers in the hands of the states. This pow as interpreted by the courts, left the states free to ignore e process and commerce clauses of the constitution. As a result, ates set up trade barriers against each other, limiting the imrtation of alcoholic liquors. This was done in a variety of ways. t-of-state shippers were required to take out licences; wholeers who distributed alcoholic liquors produced outside of the te were required to pay higher licence fees; the licence fee of e manufacturer who used in his product home-grown grapes was ver than that of the manufacturer using imported grapes; taxes re higher on imported beverages than on those produced domesally; five states in 1942 required that beer contain at least 66⅔% rley, thus subsidizing the barley farmer; nearly two-thirds of e states exempted exports from excise taxes; many other disminatory measures had been adopted. However, there was o a strong countermovement to abolish these restrictive asures, which were passed either to encourage home industry agriculture, or in retaliation for discriminatory action by other tes.

State control of liquor presented a highly confusing picture 1942. Of the 48 states, none was completely dry. (Kansas, lahoma and Mississippi permitted sale of low alcoholic content r only.) Seventeen states[1] had a monopoly of the liquor ffic within their borders, with the important exception of beer l wine. These were in all cases left outside the monopoly. Wyoming, the state monopoly controlled only the wholesale siness.) In the remainder of the wet states (28), licences were ued to private operators.

Total revenue in 1941[2] from the states was $438,000,000, of ich the licence states supplied $265,000,000 and the monopoly tes, $173,000,000. Total monopoly state sales in 1941 varied m $15,000 in Alabama to $98,000,000 in Pennsylvania. Monopstates sales in 1941, in Ohio, were $70,000,000; in Michigan, ,000,000; in Washington, $19,000,000; in Iowa, $16,000,000; Virginia, $16,000,000. The income from state licence fees in 1 ranged from $11,000 in Wyoming to $18,000,000 in New rk. Ohio and Pennsylvania collected in licence fees $6,000,000 h; California, $5,000,000; Illinois, $1,280,000. The cost of te administration in 1941 varied from $9,000 in Nevada to 375,000 in Pennsylvania. It was $1,310,000 in California; 150,000 in New York; $832,000 in Texas; $545,000 in Alana. The cost of alcoholic liquor sold in 1941 in the monopoly tes varied from $3,064,000 in Idaho to $69,663,000 in Pennvania. In Ohio, alcoholic liquors were sold which cost ,960,000; in Minnesota, $41,544,000; in Washington, $16,,000. Receipts from state taxes in 1941 varied from $222,000 Nevada to $39,000,000 in New York. Wisconsin receipts from e taxes were $6,500,000; Texas, $8,000,000; Ohio, $12,000,; California, $12,000,000; Illinois, $18,000,000; Pennsylvania, ,000,000. Local revenues in 1941 varied from $213,000 in vada to $9,000,000 in Illinois. Local revenue collected in Mashusetts was $43,000,000; New Jersey, $4,400,000; Wyoming, 300,000; North Carolina, $1,800,000; South Dakota, $1,050,; Minnesota, $1,000,000; Missouri, $1,000,000; Oregon, 0,000.

n the monopoly states there were, in 1942, 16 liquor control mmissions or liquor control boards and one liquor control mmissioner. In the licence states, control was vested in liquor trol commissions, liquor control boards, commissioner of enue, board of equalization, state licensing authority, state erage department, state revenue commission, supervisor of lic accounts, state comptroller, state tax commission, etc. se differences in title in the licence states did not reflect portant variations. A genuine distinction was that between those control authorities which dealt solely with liquor control and those with which liquor control was only a part of their duties.

These governing bodies generally had 3 to 5 members, field inspectors ranging from 35 to 225 and an adequate office force. Where control of liquor was given to agencies having other duties, the administration of the liquor laws got only partial attention; in fact the new tasks might be quite unwelcome. The requirements of liquor control were so great and so complicated that a separate administrative agency was believed to be necessary to operate at top efficiency. In California the board of equalization asked to be relieved of the task of liquor control.

Salaries for liquor control authorities in 1942 varied from $10 per diem in Alabama, Idaho, Texas, Montana, Oregon and Vermont to $16,500 per annum in New Jersey. In New York the chairman got $12,000, the four other members, $7,500. In Massachusetts the chairman got $7,500, the other members, $7,000. In Iowa, Ohio, Utah, Minnesota and Missouri the salary was $4,500. In Illinois the chairman got $5,000, the two others, $4,800. In Indiana and West Virginia the salary was $6,000.

In a few states like New Jersey, there was a single person in control, but in 16 other states the liquor commission or similar body selected an administrative officer who was in charge of the work. Very few states had civil service systems for employees in 1942. Illinois had such a system. Maine, Alabama, Pennsylvania, New York, Michigan and Wisconsin had partial civil service systems, with important exemptions. In five licence states, Connecticut, Illinois, Massachusetts, New Jersey and New York, the finance department or state department of taxation collected liquor excise taxes, but left all other factors in control to specially created liquor control bodies. Of the 45 wet states, 35 had the power to suspend as well as revoke; 38 states regulated closing hours, 36 states made distinction between sale for on- and off-premise consumption; 35 states regulated advertising; 29 provided for the fixing of quality standards and 20 provided for proper labelling; 35 states provided for local option elections. Of the ten states which did not allow local option, four were monopoly states and 6 licence states.

The following states had exclusive state administration in 1942: monopoly states—Alabama, Idaho, Iowa, Michigan, Montana, New Hampshire, North Carolina (state supervision; county-operated liquor stores in counties voting therefor); Ohio, Oregon, Pennsylvania, Utah, Vermont, Virginia, Washington, West Virginia, Wyoming (monopoly of wholesale business only; retailer licensing by counties and municipalities). The licence states—California, Connecticut, Delaware, South Carolina. In the following licence states there was state, county and municipal participation: Arizona, Arkansas, Colorado, Florida (state and county only); Georgia, Illinois, Indiana (state and county only); Kansas, Kentucky, Louisiana (parish and municipal only); Maryland, Massachusetts (state and municipal only); Minnesota (state and local only); Mississippi, Missouri, Nebraska (state and municipal only); Nevada, New Jersey, New Mexico, New York (local authorities recommend); North Dakota, Oklahoma (state and county only); Rhode Island (state and municipal only); South Dakota (state and municipal only); Tennessee, Texas, Wisconsin (state and municipal only). Maine, alone of the monopoly states, had state and municipal participation.

Among cities, in Los Angeles, San Francisco, Pittsburgh and New York local authorities had no power to issue retail liquor licences. (Local authorities recommended in New York city.) In Detroit and Denver, the state governing authorities issued retail local liquor licences subject to local approval. In Boston, Minneapolis and New Orleans, local retail liquor licences were granted by local authorities subject to approval by state authori-

---

labama, Idaho, Iowa, Maine, Michigan, Montana, New Hampshire, North Carolina, , Oregon, Pennsylvania, Utah, Vermont, Virginia, Washington, West Virginia and ming.

atest figures available in 1942.

ties. Cities with full retail liquor licence issuing power in 1942 included Chicago, St. Louis and Milwaukee.

Monopoly states which allowed sale of spirituous liquor by the drink allowed it only in clubs, hotels and restaurants. In most states, the governing body was given discretion in the granting of licences. Sixteen had limitation on number, such as not more than one to each 1,000 inhabitants, although limitation in number was frequently by city ordinance. In some cases transfer of licence from one person to another was prohibited. All imposed severe penalties for selling to minors or intoxicated persons. Licence fees were usually graduated. Retailers, distillers and wholesalers paid different fees. The fee for manufacturer's (distiller's) licence was highest. A difference was made in licence fees for sales for on- and off-premise consumption. There was an ascending scale of fees for retailers, depending upon the size of the community in which they were located. The fee for retail licence ranged from $25 to $1,200 in 1942. Where power to revoke was given to the states, proceedings were set up for hearings prior to revocation, for rehearings and for appeal to the courts. As a rule, a retailer, revocation of whose licence was sought, could remain open until there was final adjudication. State governing bodies sometimes acted as appeal bodies to which decisions made by local bodies might be referred.

Powers of the inspectors and agents of the governing bodies varied widely. In some states they had police powers, in some they had power only to inspect licences. The state authorities also regulated the activities of distilleries, breweries, rectifiers, boats, railroads and the manufacture of alcohol for nonbeverage purposes. They prohibited the giving or lending of money or merchandise by brewer, manufacturer or distributor to a retailer. Practically all the states went further and forbade subsidization of any kind, with minor exceptions for advertising signs and literature. Credit to retailers beyond that usual to ordinary trade practice (specifically defined) was forbidden. The retailer (except in the case of hotels and clubs) was forbidden to extend credit to a customer.

States, and in some instances, municipalities required that coils be cleaned regularly, and some prescribed the manner of cleaning. In Pittsburgh, premises had to meet requirements of the plumbing code.

Thirty-five states permitted local option in 1942. This allowed a specific area, sometimes a municipality or village, sometimes a county, sometimes a precinct or group of precincts in large cities (there were many variations), to decide whether or not alcoholic liquor might be sold. The question presented at the local option election might be in different forms. It might be the prohibition of the sale of all alcoholic liquor. It might be all liquor except for off-premise consumption; it might be all liquor except beer, with the alcoholic content specifically defined, or it might be all liquor except beer for off-premise consumption. In a precinct election in Chicago the two questions were submitted at the same time. Sale for off-premise consumption meant, of course, the sale of liquor in packages (bottles). There were limitations also upon the length of time between local option elections.

Antisaloon authorities estimated that after repeal there were approximately 10,000 local option elections up to the end of 1942, in which the drys were victorious in about 7,000. It was estimated that about one-sixth of the population of the United States lived in dry or moist (beer and wine only or beer only) areas in 1942. Six states—Delaware, Indiana, Louisiana, Michigan, Missouri and Montana—had no dry areas.

Administrative cost of control systems in 1942 ranged from 1 cent in North Carolina and 2½ cents per capita in Illinois to 16 cents in New Jersey. Arkansas cost was 3 cents, Wisconsin 9 cents, Minnesota 8 cents, Indiana 11 cents, Massachusetts 4 cents, Missouri 5 cents, Texas 16 cents.

Statistics on per capita consumption of alcoholic liquors sented no proof in 1942 that consumption was less in mono states. States having the same type of control showed gre differences than that between the two systems. Presence o large agricultural element, nationalistic groups in large numb and economic differences accounted more accurately for the v ations noted.

It was too early in 1942 to say whether or not the s monopoly control of the sale of alcoholic liquor was or was n success. The state monopoly systems entailed, of course, a m larger pay roll, responsibility for the efficient operation of l numbers of state stores, and all the machinery incident to a h business venture. If a corrupt or venal political machine wa control, there was a great opportunity for corruption and voritism.

Private agencies were active in 1942 in supplementing off regulation. These were of two types: organizations of citizens are interested in law-enforcement and organizations within liquor industry itself which are interested in preserving eth standards, and in self-policing. Of the first type were the J nile Protective association, Child Protection league, Vigila association, Moderation league and many others. Practic every city of more than 10,000 had some organization of sort in 1942 even if it was only a committee of a women's or city club. These organizations had prestige, and they di fluence official action, often by bringing forcibly to public at tion some long-standing abuse or outrageous situation. Man them worked with local authorities, and sent the results of vestigation as well as complaints directly to them.

The other type also had many variations. Tavern keepers well organized, package stores likewise. The Distillers Insti and Allied Liquors were national in scope. They included tillers, bottlers, wholesalers, warehousers; they opposed impr methods and conduct in the liquor industry and sought to operate with state and federal governments. In the Nebr plan, the brewers refused to sell retail outlets suspected of lating the laws or engaged in antisocial practices. Suspected fenders were reported to the authorities. Each state was div into districts and a field representative placed in each one. Ohio plan provided for the reporting of violations by the representative of the Distillers Institute, which investigated reported to the authorities. This plan was proposed by the ex tive director of the Distilled Spirits Institute.

Canada and Europe.—Most of the provinces in Canada a system of government control in 1942. Some required a pe from the individual, a practice also followed in some of monopoly states. In Manitoba the permit fee was $1 a year Norway, prior to German occupancy, a private monopoly, Vinmonopolet, controlled the entire industry. The managing rector, however, was appointed by the King. The framin general policies was by a council of 15 named by the sto (parliament). Sweden adopted a similar system. In 1942, liquor control board appointed by the king supervised a pri corporation which had control of manufacture, distribution import. The government was represented on the board. R sales were controlled by 121 private systems. Certificates issued to private purchasers. England had a licensing sys Licences were issued by justices appointed for life by the chancellor. Purchases on premises had to be by glass or bo Distilleries and breweries were also licensed; no private purc permit was required.

Holland had a licensing system. In the U.S.S.R. the S Alcohol Monopoly exercised exclusive control in 1942. No was allowed for consumption on premises except in hotels staurants. Government stores sold liquor for off-premise con- mption. (*See* also BREWING AND BEER; INTOXICATION, ALCO- LIC; LIQUORS, ALCOHOLIC; WINES.)

quors, Alcoholic. The most important alcoholic liquors are whisky (or whiskey), gin, rum, andy and liqueurs. Whisky is distilled from a fermented mash grains. In American whiskies either corn or rye grain pre- minates. Scotch whisky is made from barley malt which has quired during its preparation the "smoky" aroma which is aracteristic of it.

Gin or geneva had its origin in Holland. English gin—which s at first a copy of the Dutch product, but produced under a dified method—dominated not only the British, but also the neral world market. London dry gin is by far the most popular riety. However, the production of gin in the United States normal times is much greater than in England.

Brandy, or more specifically "grape" brandy, was recognized a long time as almost an exclusive product of France. In par- ular, the product originating from the Charente district, and ich alone is entitled to the designation "cognac," was con- ered as a standard for this type of beverage. A quite fine qual- of grape brandy was being produced in California.

The United States was for many years the country of greatest duction and consumption of potable spirits. Because of exist- political conditions, production in practically all foreign coun- es was considerably curtailed, in most instances (as in Scot- d) entirely suspended. Consumption in these countries also s materially reduced. Accurate records for late years were obtainable.

n the United States many whisky distilleries began to use ne of their available facilities for the production of industrial ohol (grain spirits at 190°) toward the end of the year 1941. ring the year 1942 most of the existing beverage distilleries verted their equipment to make industrial spirits. Production whisky was entirely discontinued under government orders as Oct. 1942, and practically all grain spirits distilleries were nmandeered by the government for alcohol production. The duct was being used in the manufacture of munitions and thetic rubber. Production of brandy and rum continued, but a limited scale under allotment of the raw materials. Con- erable stocks of whisky were in the warehouses, and were ex- ted to last under a conservative withdrawal policy for about r years.

Whisky was in 1942 by far the predominant alcoholic beverage the United States. In the fiscal year ending June 30, 1942, .307,000 American proof gallons (or tax gallons) were pro- ed, as against 121,852,000 gal. in the preceding year. The duction of brandy was 29,271,000 gal. (an increase of about 00,000 gal. over the previous year); rum 3,106,000 gal.; gin 45,000 gal.; and diverse other spirits 20,000,000 gal.

Almost the entire whisky production was concentrated in five tes: Kentucky accounting for 63,670,000 gal.: Illinois 20,020,- gal.; Indiana 14,630,000 gal.; Pennsylvania 8,760,000 gal.; ryland 7,340,000 gal.; and all other states 5,840,000 gal.

The apparent consumption of all alcoholic liquors amounted to ,208,000 gal. at various proofs ranging predominantly from proof to 100 proof. These consumption figures are expressed American "wine gallons," which means the volume of liquid as bottled at the respective alcoholic strengths. The various types of liquors making up this total consumption were: American (domestic) whisky 132,395,000 gal.; imported whiskies 11,930,000 gal.; gin 15,160,000 gal.; rum 1,202,000 gal.; brandy 1,908,000 gal.; cordials and liqueurs 4,614,000 gal.

The gin in 1942 was practically all of domestic origin. A large percentage of the rum came from Puerto Rico. (*See* also BREWING AND BEER; WINES.)

The United States had been producing for years most of the whisky, with Scotland next, followed by Canada and Ireland. Australia also used to turn out considerable quantities. War conditions changed the situation completely. Production in Scotland ceased sometime in 1942, but was reputedly continued in Ireland, although on a greatly reduced scale. Exports from Scotland and Ireland were materially reduced as against previous years. Exports from the U.S. increased; however, shipments to some countries had to be discontinued. (*See* also LIQUOR CONTROL.)

(A. J. LI.)

List, Siegmund W. W. (1880–), German army officer, was born in Oberkirchberg, Bavaria. He attended the military academy in Munich, graduating in 1898, and was commissioned a lieutenant in the Bavarian army in 1900. In 1914 he became a captain on the Bavarian general staff and saw service in World War I. In 1930 he was made commander of the infantry school at Dresden. In 1934 Adolf Hitler appointed him commander of the fourth army district of Dresden. After the Austrian anschluss in 1938, he was put in charge of the Austrian army. He was general commanding the armies of occupation of Czechoslovakia in Oct. 1938 and was governor of Moravia in 1939. He played an important part in the conquest of Poland in Sept. 1939 and was made a field marshal by Hitler after the campaign in France, during which he was commander of the 12th army. Marshal von List was in command of German armies on the Moscow front during the Russo-German campaign of 1941. In early battles his forces pressed beyond Mozhaisk in the drive on the soviet capital, but powerful Russian counterdrives compelled him to retreat in the winter of 1941. In May 1942 List reportedly asked Premier Antonescu for new Rumanian levies for the Russian campaign. In September List succeeded Von Bock as commander of German armies in the central sector; in December he was believed to have been succeeded in turn by Field Marshal Von Mannstein at this post.

Literary Prizes. The literary prizes for the year 1942 were as follows:

International.—NOBEL PRIZE FOR LITERATURE not awarded since 1939.

United States.—AMERICAN ACADEMY OF ARTS AND LETTERS AND THE NATIONAL INSTITUTE OF ARTS AND LETTERS, AWARDS IN LITERATURE, $1,000 each to Norman Corwin, Edgar Lee Masters, Muriel Rukeyser and Hermann Broch for creative work in literature.

JOHN ANISFIELD AWARDS (*Saturday Review of Literature*) to Leopold Infeld for his autobiography, *Quest* (Doubleday), the best book concerned with racial problems in the field of creative literature; to James G. Leyburn for *The Haitian People* (Yale), scholarly research in the racial field, $1,000 to each.

ATLANTIC MONTHLY PRESS $10,000 NOVEL CONTEST, no award made.

CHICAGO FOUNDATION FOR LITERATURE AWARDS to Vincent Starrett for his *Books Alive* (Random House); to Dr. Preston Bradley "for distinguished service to literature"; to Rachel Albright for poetry.

COMMONWEALTH CLUB OF CALIFORNIA.—GOLD MEDAL FOR GENERAL LITERATURE to Joseph Henry Jackson for *Anybody's Gold* (Appleton); GOLD MEDAL FOR SCHOLARSHIP AND RESEARCH to Lesley Byrd Simpson for *Many Mexicos* (Putnam); SILVER MEDALS to Richard T. LePiere for *When the Living Strive* (Harper); to John W. Dodds for *Thackeray* (Oxford); and to Frank J. Kleinberg for *The Morning of America* (Appleton).

DIAL PRESS AWARD for an outstanding novel on the problems of adjustment facing young people in America today, $1,000 and royalties to Gladys Schmitt for *The Gates of Aulis*.

DODD, MEAD PRIZES.—$10,000 DODD, MEAD—REDBOOK MAGAZINE FICTION PRIZE to Ellen Proctor for *Turning Leaves;* RED BADGE DETECTIVE STORY PRIZE to James Wellard for *The Snake in the Grass;* INTERCOLLEGIATE FELLOWSHIP AWARD, $1,200 to Barbara Bentley for her novel, *A Hedge Against the Sun*.

FRIENDS OF AMERICA WRITERS' AWARD to promote high standards and ideals in American writing, $1,000 to Paul Engle for his volume of poems, *West of Midnight* (Random House).

Guggenheim Fellowships, 82 awards amounting to about $2,500 each. Among the winners were two poets, George Zabrishie and Wystan Hugh Auden; three women fiction writers, Carson McCullers, Eudora Welty and Dorothy Baker. John Dos Passos received an award to complete his biography of Thomas Jefferson; Gustavus Myers, his book on bigotry in the U.S.; Dixon Wecter, a history of the Roosevelt family; Mark Schorer, a book about William Blake; Justin O'Brien, a study of André Gide; Gordon Norton Ray, a definitive edition of the letters and private papers of William Makepeace Thackeray. Remaining awards made in fields other than literature.

Guggenheim Fellowships to Latin American Scholars, 20 awards in various fields. Winners in the arts and humanities were: Gabriel Fernández Ledesma, for a book on folk arts of Mexico; Professor Arturo Arnaiz y Freg, a history of Mexican thought; Professor Antonio Hernández Travieso, Cuban biography; and Wigberto Jiménez Moreno, pre-Hispanic culture. About $2,000 each.

Harper 125th Anniversary Award of $12,500. Prize divided between Julian Green for *Memories of Happy Days* and John Andrew Rice for *I Came Out of the Eighteenth Century.*

O. Henry Memorial Award Prize Stories of 1942 (Doubleday); first prize of $300 to Eudora Welty for "The Wide Net" (*Harpers Magazine*); second prize of $200 to Wallace Stegner for "Two Rivers" (*Atlantic Monthly*); third prize of $100 to William L. Schramm for "Windwagon Smith" (*Atlantic Monthly*); a special prize of $100 for the first published short story, to Jeanne E. Wylie for "A Long Way to Go" (*Atlantic Monthly*).

Avery and Jule Hopwood Awards (University of Michigan), $750 fiction prize divided among three students: Raymond Early for an historical novel, *Mightier Than the Sword;* Rosemary Obermeyer for a fantasy, *Golden Apples of the Sun;* and Jay McCormick for a novel of the Great Lakes, *November Storm;* $500 poetry prize to Robert E. Hayden for *The Black Spear;* drama prize to Jack Mitchell for *Brita;* essay award to Laia Hanau, Lois Helene Van der Meulen, Celia Hwaguen Chao and G. Nelson Bentley.

Houghton Mifflin Life-In-America Series Awards, $2,500 each to Sam Byrd for *Small Town South;* and to Dr. Frederick Carpenter Irving of Boston Lying-In hospital for *Safe Deliverance.*

Houghton Mifflin Literary Fellowship, $1,500 to Donald MacRae for a projected novel on the American scene and the competitive ruthlessness of individual democracy in the 20th century.

Alfred A. Knopf Literary Fellowships, $1,200 each to Robert Faucett Gibbons for fiction; Dr. Angie Debo for history; and Russel Blaine Nye for biography of George Bancroft.

Laetare Medal (University of Notre Dame) to Helen Constance White, author and teacher.

J. B. Lippincott Prize, $1,000 to a University of Alabama student, Arthur Phillips, for his novel, *Victory In The Dust* (Lippincott).

Russell Loines Memorial Fund Poetry Award, $1,000 to Horace Gregory, "not as a prize but as recognition of value"; his most recent volume is *Poems: 1930–1940* (Harcourt).

National Book Award (American Booksellers Association) to George Sessions Perry for *Hold Autumn In Your Hand* (Viking), "the Booksellers' Discovery."

New Directions Press (*Direction Magazine*) Service Men's Writing Contest, $100 to Herbert Avedon for "Michael," a story of an army mule; $50 to Martin Savela for "Man In Uniform."

New York University, Society for the Libraries Of, Annual Gold Medal to Conrad Richter, author of *The Sea of Grass* and *The Trees* (Knopf).

Ohioana Library Award (State Office Building, Columbus, O.), a medal and war bond to James B. Reston for *Prelude To Victory* (Knopf).

Pacific Northwest Library Association, Children's Section, to Laura Ingalls Wilder for *By the Shores of Silver Lake* (Harper).

Parents' Magazine Award to Anna W. M. Wolf for *The Parents' Manual* (Simon).

Poor Richard Club of Philadelphia to Pearl Buck a citation for distinguished services in the field of literature.

Poetry Magazine, five prizes of $100 each: Levinson Prize to Karl Jay Shapiro; Guarantors' Prize to St. Jean Perse; Harriet Monroe Lyric Prize to John Frederick Nims; Blumenthal Prize to E. L. Mayo; Davis Prize to Katinka Loeser.

Pulitzer Prizes.—Novel, to Ellen Glasgow for *In This Our Life* (Harcourt); history, to Margaret Leech for *Reveille In Washington* (Harper); biography, to Forrest Wilson for *Crusader in Crinoline,* a life of Harriet Beecher Stowe, (Lippincott); poetry, to William Rose Benét for *The Dust Which Is God* (Dodd). (*See* also Pulitzer Prizes.)

Roosevelt Distinguished Service Medals for services in fields associated with the career of Theodore Roosevelt, to Booth Tarkington; Dr. Rufus Matthew Jones, founder of the American Friends Service committee and author of numerous books on Quaker history and philosophy; to Henry Lewis Stimson, secretary of war.

Constance Lindsay Skinner Medal (Women's National Book-association) to Irita Van Doren, editor of the *N.Y. Herald Tribune Books,* for her work "in dramatizing books for the masses."

Southern Women's National Democratic Committee Award, $100 for the most distinguished book by a southern writer, to Ellen Glasgow for *In This Our Life* (Harcourt).

Yale Series of Younger Poets publication won by Margaret Walker, a negro poet, for her manuscript, *For My People.*

Great Britain.—James Tait Black Memorial Prizes to Joyce Cary for his novel, *A House of Children;* to John Francis Gore for his biography, *King George V* (Scribner), £250 and medal to each.

Rose Mary Crawshay Prize for historical or critical work on any subject connected with English literature by a woman, to Sybil Rosenfeld for *Strolling Players and Drama in the Provinces, 1660–1765* (Macmillan).

Hawthornden Novel Prize, £100 awarded posthumously to Llewellyn Rhys, killed in service in the R.A.F., for his *England I Village* (Reynal).

Children's Books.—Caldecott Medal for a Picture Book to R McCloskey for *Make Way For Ducklings* (Viking).

Carnegie Medal (British) to Mary Treadgold for *Left Till Calle* (Doubleday).

Julia Ellsworth Ford Foundation Award, $2,000 to Isabel M nan McMeekin for *Journey Cake* (Messner).

Herald Tribune Children's Spring Book Festival Competi three awards of $200 each, to Peter Wells for *Mr. Tootwhistle's Inve* (Winston), the best book for younger children; to Commander Ec Ellsberg for *I Have Just Begun To Fight: The Story of John Paul* (Dodd), the best book for middle-aged children; to Rosamund Van de Marshall for *None But the Brave* (Houghton), the best book for children.

John Newbery Medal (American Library association) to W Dumaux Edmonds for *The Matchlock Gun* (Dodd).

Lithium Minerals. Lepidolite, spodumene and amblyg are produced mainly in South Da with some smaller output in North Carolina, and lithium-so phosphate is recovered from the brines of Searles Lake, C The combination of the output of minerals with a comparat low lithium content with the much richer salt gives a figure w does not have a great deal of significance. The total shipmen minerals and salts in 1941 was 3,832 short tons ($115,718 compared with 2,011 tons ($80,679) in 1940. The increase of in weight as against only 43% in value would indicate a l proportion of minerals in the 1941 total. (G. A. R

Lithuania. A Baltic country of northeastern Europe, N Poland; in 1942 it was a part of Germany's " land." Area, 22,959 sq.mi. (1940); pop. (Jan. 1, 1940) 2,879

Chief cities of Lithuania are: Vilnius (Vilna, capital, 207, Kaunas (actual seat of administration, 152,365). Religion, dominantly Roman Catholic (80.5%). Ruler in 1942 was missioner General Adrian von Rintelen, who was made respon to Reichscommissar Heinrich Lohse of the Ostland.

History.—The kaleidoscopic changes of Lithuanian po history were epitomized in 1940–1942: Under the control o U.S.S.R. from June 15, 1940, to June 23, 1941, the Lithua then staged a revolution and declared independence; the Ge armies reached Kaunas on June 24, 1941, but allowed th dependent Lithuanian government to function for only seven weeks; on Aug. 5 this government resigned and the control was complete.

It was in Kaunas that the new Reichscommissar for the land (*q.v.*), Heinrich Lohse, announced on July 27, 194 program of "replacing chaos by European order, and in subs ing construction and civilization for destruction." He late scribed his chief task as that of establishing a "supervised omy—the personal initiative of businessmen," and the integ of Baltic economy into that of Europe. The latter mea course the subordination of Lithuanian economy to German for foodstuffs and raw materials. Property rights in handic small industry and trade were restored to some extent a Germans reorganized the sovietized country, but land and movable property were returned to the farmers only "for agement." Schools were to be restored, and some respec guaranteed to local traditions and customs, yet it was openly that German was to be made the universal lang Cities were to be restored after the war destruction in such as to give the region as much as possible the aspect it had the influence of the Teutonic knights and the Hanseatic L

liminary work was done under the famous Todt organization
1942.

'he special concern of Germany with Lithuania may be illus-
ed by the estimate of Lithuanian products going to Germany
1941–42 (Prof. K. Pakstas): 150,000 tons of grain; 250,000
s of potatoes; 70,000 tons of meat; 70,000 tons of hard fod-
; 10,000 tons of straw; 14,000 tons of butter; plus eggs, wood,
, etc. in large quantities. It was because of the rich poten-
ties of the land that the Germans were willing to aid agricul-
with fertilizers, but there was a shortage of both fertilizers
machinery in 1942. Farm controls were rigid, and prices low.
"Netherlands East company," with a capital of 2,500,000
ders, was founded to help develop the "Ostland"—and to
te Dutch interest in the "new order." (The Danes were slow
espond to a similar appeal.) In Aug. 1942 some 300 Nether-
ls colonists moved to Lithuania, which appeared to be the
f centre of activity for this consolidated investment and
nizing company. German companies monopolized the oil,
rt trade, and other phases of Lithuanian economy.

ducation.—In 1938–39 there were 2,335 private schools with
429 scholars, and 83 secondary schools and gymnasia with
39 scholars. Part of the university at Kaunas was moved
to Vilna Jan. 15, 1940.

nance.—The monetary unit is the lita (=16.1 U.S. cents at
established in 1922 as one-tenth the U.S. gold dollar). At the
of 1939 the foreign debt was 68,915,300 litas, and the do-
tic debt of the government was 65,231,200 litas. In 1939
budget estimate of the government balanced at 341,785,274
.

ade and Communication.—In 1938 imports amounted to
686,000 litas, and exports to 233,200,000 litas. Chief articles
nport were cotton yarn and thread, woollen yarn and thread,
on fabrics, woollen fabrics, coal and fertilizers. Chief articles
xport were meat, butter, flax fibre, pigs and eggs. Almost
of the exports went to Great Britain, 27% to Germany,
% to the U.S.S.R. Imports came 31% from Britain, 24.5%
Germany, 6.7% from the U.S.S.R. In 1938 telephones
bered 26,591; radio sets 53,667; broadcasting stations 2.

griculture.—Almost 77% of the population is engaged in
culture, and 49% of the land is arable. Chief products in
and their output in short tons were as follows: rye 726,636;
at 282,850; barley 282,740; oats 450,841; potatoes 2,290,469;
fibre 31,416; butter 21,890. The 1939 estimate of livestock
horses 521,000; cattle 1,004,000; sheep 1,224,000; pigs
4,000; poultry 5,130,920.

lanufacturing.—In 1938 some 1,441 industrial establishments
loyed 40,818 people. Meat and fish products were valued at
19,000 litas; manufactured timber 12,532,000 litas; tissues
yarns 28,131,000 litas; machines, etc. 13,215,000 litas;
ner goods 14,374,000 litas. Lithuania increased industrial pro-
ion from an index of 100 in 1929 to 354 in 1939. Total in-
rial production of 1939 was 405,749,000 litas. (F. D. S.)

inov, Maxim Maximovich

(1876–), Russian politician, was born July 17
ialystok, Russia. He joined the Social-Democratic party in
and supported Lenin and the bolsheviks in the factional
of 1904. After the revolution (1917) he was the party's
ipotentiary in London, where he was imprisoned as a hostage.
ook part in conferences at Genoa and the Hague, led soviet
gations at the 1927, 1928 and 1929 sessions of the preliminary
mament commissions of the League of Nations and in 1928
d the Kellogg pact for the U.S.S.R. He was made commis-
or foreign affairs in 1930 and championed collective security
eague of Nations sessions. He was suddenly dropped from his foreign office post May 3, 1939, in the midst of negotiations with Britain and France for a general mutual assistance pact; the mystery of his ouster was solved in Aug. 1939 when Germany concluded a nonaggression pact with the U.S.S.R. He was expelled from the communist party Feb. 21, 1941, but returned to favour after the nazis attacked the U.S.S.R., June 22, 1941, and was appointed soviet ambassador to the U.S. Nov. 6, 1941. In this post he made several pleas for the opening of a second front against Germany, notably in a speech at New York city June 22, 1942, the first anniversary of Russia's entrance into World War II.

Livestock.

Production of meat animals in 1942 throughout the Americas, Australasia and South Africa generally increased and in some countries, notably the United States and Canada, reached all-time peak numbers. Numbers of draft animals in most countries declined. In Europe there was a still further decline in 1942 in all types of livestock, particularly in northwest Europe, which was dependent on feed imports to maintain normal herds and droves. The peak in livestock production in Europe was in 1939 when, excepting the U.S.S.R., there were 112,000,000 cattle and 134,000,000 sheep. Hogs were at peak numbers in practically all countries except Spain, where droves had been decimated by the civil war of 1936–39. The total for hogs was 82,000,000, which was 2,000,000 short of the previous high because of the losses in Spain. The wartime reduction of livestock in Europe, however, was apparently not as heavy as generally believed. The number of cattle in 1942 was 16% less than in 1939, the number of hogs 27% less and the number of sheep 6% less (estimates by the office of foreign agricultural relations of the United States department of agriculture).

Table I.—*Numbers of Livestock on U.S. Farms, 1942, 1941 and 10-Year Average*

	1942 (Jan.)	1941 (Jan.)	1931–40 av.
Horses	9,856,000	10,214,000	11,704,000
Mules	3,811,000	3,922,000	4,677,000
Cattle	74,607,000	71,461,000	67,575,000
Sheep	55,979,000	54,283,000	52,281,000
Chickens	473,933,000	422,909,000	422,885,000
Turkeys	7,710,000	7,252,000	6,317,000

Canada showed an increase in the production of all meat animals in 1942, the larger gains being in the prairie provinces. Canadian livestock numbers for 1942 and 1941 are shown in Table II.

Table II.—*Numbers of Livestock on Canadian Farms, 1942 and 1941*

	1942	1941
Cattle	8,945,000	8,511,000
Hogs	7,133,000	6,093,000
Sheep	2,816,000	2,789,000

The United States on Dec. 23, 1942, signed a trade agreement with Mexico reducing the tariff on Mexican cattle imported into the United States. Reductions had previously been granted on Canadian exports to the U.S. (*See* also AGRICULTURE; CATTLE; HOGS; HORSES; MEAT; POULTRY; SHEEP.) (S. O. R.)

Livestock Shows: *see* SHOWS.

Lombard, Carole

(1908–1942), U.S. movie star and wife of Clark Gable, was born Carol Jane Peters, Oct. 6, in Fort Wayne, Ind. She attended school in Los Angeles and, after some success in amateur theatricals, tried to "crash" the movies. She was engaged for minor roles and played in Mack Sennett comedies, but remained an obscure actress until 1934, when she was co-starred with many of Hollywood's leading men, including George Raft, Gary Cooper, John Barrymore, Bing

A MEMORIAL TO LENIN, in front of the London house where he lived in 1902-03, was erected by the London County council and unveiled by Russian ambassador Maisky March 15, 1942. In 1941 the house was destroyed in a German air raid

Crosby and William Powell. She later established a reputation as a comedienne in a series of madcap comedies and was an outstanding favourite with U.S. movie-going audiences. Among her better-known films were *Nothing Sacred, Swing High, Swing Low, In Name Only, True Confession* and *They Knew What They Wanted.* After the U.S. entry into World War II, Miss Lombard appeared at many rallies to stimulate the sale of war bonds. It was on her return from such a rally in Indianapolis that she met her death in a plane crash near Las Vegas, Nev., Jan. 16. Her last picture, *To Be Or Not To Be,* was released after her death.

London. In 1942 the great metropolis of London with its vast population presented an extraordinary challenge to its enemies and was a source of amazing inspiration to its friends. The worst of the "blitz" of enemy bombers had come and gone, and Londoners, recovering from fatigue and nerve strain, slept peacefully in their beds and rose each day more refreshed and with feelings more normal. Some old people and a few others were still frequenting the shelters of the underground "Tube" stations, and in the large shelters of the East End families, in large numbers, continued to spend their nights under cover. Educational and social work was undertaken in these shelters.

Theatres reopened in practically all intact premises. Motion pictures extended their opening hours. Restaurants, in spite of food rationing, were generally filled to capacity. Shops, large and small, carried on, with window displays which were remarkably attractive in view of the limitations. Pedestrian traffic in Oxford St., Regent St., High St., Kensington and Westbourne Grove, the great shopping centres with large stores, was enormously increased in comparison with the winter of 1940–41, but motor traffic was very noticeably less, owing to the conservation of gasoline. Although civilians were still in the majority, service men and women abounded. Noticeable additions to the uniforms seen were those of the imperial forces and of the United Nations, the most conspicuous being Canadians, Americans, Polish and Norwegians.

The presence of dominion and United Nations troops in London presented some problems, partly due to the higher pay of the visitors and partly because they had no social and domestic ties in the vast metropolis. That they were welcome and treated acc
ingly was very evident, and time was to adjust temperaments
cited with experiences new both for the visitors and the h
Londoners as a whole were seeking in many and varied way
meet their visitors more than half way by providing social
other facilities.

Civil Defenses in 1942.—The fear and risk of fire loc
largest in the minds of the inhabitants and in their plans.
fire brigade during the year was transferred from the Lon
county council to the National Fire service and, from a peace
service of 3,000 officers and men, housed in 60 fire stations,
expanded to 25,000 men and women using 400 premises,
pumps of varying capacities with 2,400 towing units, 500 m
cars and 860 motorcycles. There were also river craft to
fires on and adjacent to rivers and canals. In addition, a
compulsory fire watching service for business premises and
dences was being organized out of civilian residents and bus
men and women.

The civil defenses manned by civilians, excepting the Fire
ice, were organized as a whole under a scheme which plac
commissioner responsible to the home secretary in charge
region, of which greater London was one. The London region
subdivided into nine groups; five of these groups each cov
from five to eight metropolitan borough council areas and
remainder were outside London. This subdivision insured
bility and mutual aid, but the commissioner could concen
assistance from a wide area to where the need was greatest. A
administration was left to the appropriate local authority.

The London county council was responsible for auxiliary
bulances; evacuation; hospitals; rescue; debris disposal; Lon
ers' meals; rest centres. The metropolitan borough councils u
took decontamination; first-aid posts; fire watching; report
control centres; stretcher parties; air-raid wardens; rehousing
billeting; shelter provision.

The peacetime ambulance service, consisting of 400 officers
men with 180 vehicles based on 20 stations, was extended to
personnel, 100 stations and 1,600 vehicles. The rescue servi
extricate victims from bombed buildings consisted of 10,000
organized into 500 parties equipped at 100 places. The d
service (23,700 men) undertook clearance of roads and buil
and demolished unsafe structures. The rest centre service, w

ended because of delayed action bombs temporarily displacing ple, dealt with bombed-out families, and comprised 150 first- e centres accommodating 200 persons or more each, and 50 sec- l- and third-line centres providing accommodation for 10,000 sons. The Londoners' meals service, necessitated because of the akdown of domestic gas and water services, enabled victims of nbing to secure meals at a reasonable cost. It was at first on a sh and carry" system but this was replaced by a restaurant vice providing 200,000 meals a week. The evacuation scheme uded school children, mothers with children below school age, gnant mothers, blind persons, and the aged and infirm. At one e five-sixths of London's children were evacuated but the vast ority of these children had returned.

During 1942 it became possible to reveal, in general terms, the nt of bomb damage already sustained. If all the damage done he rest of England were totalled, London's damage would still n excess of this total. More than 40,000 houses were demol- d or damaged beyond repair, and in addition more than 500,- were damaged but were capable of repair. The rest centres already accommodated 130,000 people, 10,000 at one time. repair squads had had to deal with 400 cases of damage to ers and 100 of damage to the Thames embankment.

inances.—Although national taxation had leaped out of all vious recognition, local rates for London services remained y static and were in some cases reduced. This was due partly he contraction of municipal services and partly to the great ease in government grant-aided or wholly-paid services.

he London county council budget for the year 1942–43 on cap- account showed a reduction to less than 1/12 of that in 1938. new developments were taking place during 1942, except for defense purposes.

he gross expenditure for the year was more than £55,000,000, greatest amount the council had ever been called upon to ad- ster, nearly £19,000,000 of which was chargeable to rates, h for 1942–43 were 6/6½*d* in the £, a reduction of 3½*d* on previous period, a total reduction in the rate in the £ since commencement of the war of 1*s*.

(R. St.)

don University. The number of internal students in 1942 increased from 8,916 to 9,162, ly in engineering. The number of external students also rose. medical schools and the School of Slavonic Studies returned ondon. An important development was the government me for scholarships in oriental languages to meet the needs of services and other government departments. On account of shortage of medical practitioners, the medical course was re- d by six months. Regulations came into force relative to en students coming under the national service acts. Much able work was done by the extramural department in connec- with education among the armed forces. Most of the chairs nt through death or retirement remained unfilled. Sir Henry rd (Rector, Imperial college) was appointed president, Mag- n college, Oxford. (S. J. W.)

Angeles. Fifth largest U.S. city, Los Angeles, county seat of Los Angeles county, Calif., had a pop- on of 1,504,277 in 1940 and an estimated population of 1,800,- in 1942. War and an influx of workers brought a boom in the rate.

e 400th anniversary of California's discovery by Cabrillo commemorated in October.

e aircraft industry expansion continued. Los Angeles munici- irport became the most important commercially in the entire , and was to be directly connected with Asia and Australia.

The huge aluminum industry served one of the world's largest markets, because of the concentration of the aviation industry. Henry J. Kaiser's $83,000,000 Fontana steel plant neared completion during the year; actual production was to begin in Feb. 1943.

The Colorado river aqueduct doubled the water supply for the Southern California coastal plain, from its source (245,000 sq.mi.) in the Rocky mountain water shed. Electrical energy in the industries of Los Angeles exceeded 9,350,000 man power in 1942.

There was an approved project sponsored by the State Railroad commission for storing quantities of natural gas underground, as a safety measure, to serve metropolitan Los Angeles.

Pan-American unity and hemispheric solidarity were symbolized Columbus Day at Civic Center by an impressive flag raising, representing 21 American republics and the Dominion of Canada. Evacuation of Japanese and persons of Japanese ancestry from the war zone was the greatest in U.S. history, conducted in an orderly manner by Lieutenant-General John L. De Witt. Difficult problems, especially a shortage of agricultural and horticultural labour, resulted.

Los Angeles county again led the nation in farm production, totalling $113,000,000 for 1941. Half-day sessions made 40,000 high-school pupils available for business, industry and agriculture. School Superintendent Vierling Kersey outlined a seven-point program of war-aid effort, giving each person a duty in volunteer activity.

The War Transportation Council in November established a program of staggered hours for business and industrial organizations, affecting the lives of most residents, to conserve rubber and to ameliorate the congestion in street car and bus transportation induced by gasoline rationing, which went into effect Dec. 1. Unusual problems arose from the long distances travelled and the general dependence upon automobiles in Los Angeles, which led the nation in surrendered tires.

Despite wartime restrictions, the symphony concerts continued in Hollywood Bowl; but audiences were limited to 10,000 persons. Los Angeles also enjoyed a grand opera season. On the whole, the city was thoroughly geared to the war effort. (R. D. Hu.)

Louisiana. One of the west south central states of the United States of America, admitted to the union in 1812 as the 18th state, Louisiana is popularly known as the "Pelican state," "Creole state" or "Bayou state." Area 48,523 sq.mi., of which 45,177 sq.mi. are land; population (1940) 2,363,880, of which 1,383,441 or 58.5% were rural and 980,439 or 41.5% urban; 64% native whites, 34.3% Negroes and 1.7% foreign born. Capital, Baton Rouge, 34,719. Other important cities: New Orleans, 494,537; Shreveport, 98,167; Monroe, 28,309; Alexandria, 27,066.

History.—The legislature met in regular 60-day biennial session on May 11, 1942. War conditions having reduced anticipated revenues far below budget requests, Gov. Jones urged economy and recommended either drastic reductions in appropriations or new tax measures to raise additional funds. A factional fight developed over an administration-sponsored emergency sales tax bill, chief opposition coming from the New Orleans members. The bill was defeated, and the legislature adjourned after passing a general appropriation bill calling for expenditures greatly in excess of anticipated revenues, without enacting any new tax measures. The governor thereupon vetoed enough items to balance the budget, most of which vetoed items affected New Orleans in particular, whose legislators had defeated the sales tax proposal. After much political bickering between state administration forces and the New Orleans faction, an extra session was convened (Aug. 20–29) to provide additional revenues to meet the state's most pressing financial needs, and a 1% "War Emergency Sales Tax" was passed. The most important act passed during the regular session was the new Louisiana criminal code.

The national defense program caused increased industrial activity in 1942. Plants engaged in war production were greatly enlarged, and several new defense industries were established. Access roads were built in the vicinities of the new army camps and airfields, and housing facilities near these military installations and the industrial centres were greatly expanded. Elaborate military manoeuvres were held in the state.

State officers in 1942 were Sam Houston Jones, governor; Mark M. Mouton, lieutenant governor; James A. Gremillion, secretary of state; A. P. Tugwell, treasurer; L. B. Baynard, auditor; Eugene Stanley, attorney general.

Education.—In 1942 public elementary schools enrolled 199,792 white and 24,845 Negro pupils; public high schools had 82,360 white and 16,234 Negro students; there were 10,496 white and 1,189 Negro teachers in the public schools. State expenditure for elementary and secondary education exceeded $25,000,000 annually.

Table I.—*Leading Agricultural Products of Louisiana, 1942 and 1941*

Crop	Yield		Value	
	1942	1941	1942	1941
Cotton, bales	598,000	313,000	$67,000,000	$33,300,000
Corn, bu.	25,000,000	22,260,000	24,000,000	16,585,000
Rice, bu.	25,758,000	19,906,000	40,000,000	24,882,000
Sugar cane, tons	4,734,000	3,947,000	23,000,000	14,599,000
Truck crops	.	.	10,000,000	8,000,000
Sweet potatoes	.	.	5,500,000	4,500,000
Irish potatoes	.	.	2,750,000	2,000,000
Soybeans	.	.	2,500,000	1,500,000
Hay	.	.	5,000,000	4,000,000
Sugar cane syrup	.	.	3,500,000	3,000,000

Annual state expenditure for higher education exceeded $7,000,000. War conditions caused substantial decreases in enrolment in Louisiana colleges in 1942.

Public Welfare, Charities, Correction.—In 1941 old-age pensions were paid to 36,000 persons; 40,000 dependent children in 16,000 families were aided; 1,260 blind persons were assisted; and 12,000 needy cases were granted general relief in Louisiana, at a total cost of $35,000,000 to state and nation.

The state maintained the following institutions in 1942: charity hospitals at New Orleans, Shreveport, Lafayette, Pineville, Independence and Monroe; insane hospitals at Jackson and Pineville; a tuberculosis hospital at Greenwell Springs; schools for the blind and deaf at Baton Rouge; training school for feeble minded at Alexandria; soldiers' home at New Orleans. There were also numerous private and endowed hospitals and orphanages. The state in 1942 maintained two prison farms for its 3,000 adult offenders and separate training institutes for 300 male and female juvenile delinquents.

Communication.—Louisiana in 1942 had 18,200 mi. of public highways, 14,410 of which were state-maintained, 10,098 being gravelled and 4,268 paved; the expenditure on highways exceeded $33,000,000. There were 4,400 mi. of railways and 4,800 mi. of navigable waterways. New Orleans, Baton Rouge and Lake Charles are ports for ocean-going commerce, with combined tonnage of 7,515,000 foreign and 11,556,000 coastwise in 1940. There were 26 airports for land planes and 11 seaplane bases and anchorages in 1942. There were 250,000 telephones in the state.

Banking and Finance.—Louisiana had 29 national banks in 1942, with assets of $475,000,000, deposits of $450,000,000, and capital, surplus and reserves of $34,000,000; and 117 state banks, with assets of $203,000,000, deposits of $185,000,000, and capital, surplus and reserves of $22,500,000. There were 67 savings and loan associations, with total assets of $75,000,000. Postal savings totalled $9,000,000. The state budget for the fiscal year

Table II.—*Principal Mineral Products of Louisiana, 1942 and 1941*

Mineral	1942	194
Petroleum (bbl.)	122,432,000	118,27
Natural gas (M. cu.ft.)	475,000,000	450,00
Natural gasoline (gal.)	210,000,000	200,00
Sulphur (long tons)	600,000	53.
Salt (short tons)	700,000	80

1941–42 was $100,000,000, with receipts and expenditures anced. Gross state debt, $135,000,000; net debt, $130,00

Agriculture.—War conditions stimulated agricultural pr tion in 1942, and the weather was generally favourable for Total value of agricultural production in 1942 was $190,00 compared with $122,000,000 in 1941; total acreage harv was 4,124,000, compared with 4,032,000 in 1941. Cash in from crops and livestock was $225,000,000, compared with $ 000,000 in 1941; from government payments, $13,200,000, pared with $17,000,000 in 1941. Crop yields in 1942 wer unusual, but prices for crops and livestock were much h than in 1941.

Manufacturing.—The production of chemicals, refined leum, lumber and cottonseed derivatives was greatly incr by the demand for war supplies, and most other types of m factures also showed a smaller increase in volume during the Nearly 2,000 industrial establishments, employing 125,000 wo and paying $150,000,000 in wages, produced finished pro worth $990,000,000 in 1942, as compared with $750,000,0 1941.

Mineral Production.—War activities stimulated the de for petroleum, natural gas and sulphur in Louisiana, and the value of mineral production was $250,000,000 in 1942 as pared with $200,000,000 in 1941. (W. F

Love, Nancy Harkness (1914–), U.S. comman the Women's Auxiliary Fe Squadron (WAFS), was born Feb. 14 in Houghton, Mich learned to fly when she was 16 years old and while a stud Vassar, 1931–34, qualified for a commercial pilot's licence was air marking pilot for the U.S. bureau of air commerce, 37. Later she became a test pilot, and in 1941 she joine husband's aviation company as sales director. On Sept. 11, Sec'y. of War Stimson announced plans to establish a u women fliers to ferry army planes from factories to air thus relieving male pilots for other duties. The unit, kno the Women's Auxiliary Ferrying Squadron (WAFS), was p der command of Mrs. Love. The WAFS, at first composed women—40 fliers and 10 administrative aides—piloted on smaller type of aircraft. Mrs. Love estimated that 600 w in the U.S. would qualify for the job under the civil servi quirements.

Luce, Clare Boothe (1903–), U.S. playwright and ber of congress, was born in New city April 10. Graduated in 1917 from St. Mary's sch Garden City, Long Island, N.Y., and in 1919 from Miss M Castle school at Tarrytown-on-the-Hudson, she later receiv honorary degree from Colby college. She was associate edi *Vogue* in 1930, and associate editor and managing edit *Vanity Fair* from 1930 to 1934. In 1935 she married Her Luce, magazine publisher. Mrs. Luce had one daughter Clare, from a previous marriage in 1923 to George Broka Republican nominee for congress from the 4th district of necticut (Greenwich) in 1942, she conducted a colourful paign, and was elected Nov. 3. She was the author of S *Shirts* (1933) and *Europe in the Spring* (1940), and such as *The Women* (1937), *Kiss the Boys Goodbye* (1938 *Margin for Error* (1939).

umber. It is estimated that the total production in the U.S. in 1942 was about 34,000,000,000 bd.ft. The estiated requirements were for 31,500,000,000 bd.ft. of softwoods nd 6,500,000,000 bd.ft. of hardwoods.

Because of the urgent demand for steel and other metals, the ar Production board ordered that 800 items, formerly made of etals, be made from lumber, plywood, plastics and other mateials. Many commonly used items, from coat hangers to refrigerors, including metal desks, filing cabinets, furniture, etc., were ing constructed almost entirely of lumber. Furthermore, in ne 1942, the government order required that all truck and ailer bodies be constructed of lumber. One order issued in one y for 800,000 trucks was estimated to save 42,000 tons of steel 1942 and 850,000 tons in 1943. These trucks require an avere of about 1,000 bd.ft. each. The production of motor truck dies and trailers was estimated at 1,000 per day, and by the st of the year 1943, production was at the rate of 1,500 per y. This meant that 1,000,000 bd.ft. of lumber were used for ucks each day.

The principal species produced in 1942 were, in order of imrtance, southern pine, Douglas fir, ponderosa pine, oak, white ne and hemlock.

An increasing number of small mills produced lumber for the ipbuilding program, for the packaging and shipment of munins and war materials, the construction of buildings in connecn with new or enlarged airports, bomber bases, training centres, pyards and increased facilities at army posts and training ntres. The demand for lumber for boxes, crates and other forms packages increased enormously. The normal demand for boxes d crates constituted about 12% to 15% of the total lumber oduction. It is estimated that in 1942 this proportion was ineased to about 25%.

The Office of Production Management set price ceilings for actically all forms of lumber. These were based upon F.O.B. ints of origin at the sawmills. Generally, the prices set were ose prevailing in March, 1942.

The lumber industry was further hampered by a lack of perienced woods and sawmill labour caused by the drafting of ny experienced men and the attraction to higher wages paid defense and war industry projects. With ceiling prices set for mber, added costs of labour and difficulty of securing sufficient ucks, machinery and other important materials for production, gging, sawing, seasoning and shipment of lumber became difficult some regions, particularly where small and new mills had been ganized to produce special war orders. The normal export movent of lumber was practically non-existent. Most of the export lumber was for special construction projects associated with the r effort in foreign countries.

The large increase in the use of plywood, estimated at 1,600,0,000 sq.ft., meant the diversion of the largest and most symtrical logs, particularly in the Douglas fir and some hardwood gions, from the manufacture of lumber into the manufacture of ary veneers for processing into plywood. (N. C. B.)

British Empire.—The spread of the war into new areas in 1942 vitably greatly affected the timber industry. Great Britain, largest timber importing country, deprived as it was from the ginning of hostilities of supplies from the producing countries Europe, found other sources of supply cut off when Japanese ces overran Malaya and Burma. Moreover, the United States oved on to a war footing, and her demands for lumber quickly sumed colossal dimensions. Canada's war production activities, o, were on an ever-rising scale. The drift of labour from Canan logging camps and the lumber industry to munitions and er industries created a serious position and in the second half the year Canada faced the gravest timber shortage in her history. The government took steps to stop the labour drift and tightened up timber control. Elsewhere in the Empire—Great Britain, Australia, New Zealand and South Africa—timber control measures became more stringent, and there was increasing dependence in these countries on locally grown woods.

Great Britain continued to draw supplies from Canada and the United States, and there were limited imports also from Russia in ships which, in convoy, had taken war supplies to that country. In the earlier war years Britain's ability to import was largely governed by shipping facilities available. Now, with the increased timber needs of the United States and Canada, it was more necessary to view the timber supply situation from the angle of the needs of the United Nations as a whole.

More and more urgency was therefore placed on production from the forests and woodlands of Great Britain. Production from home woods was approximately 600,000 tons greater than in the previous year, and in the autumn of 1942 a call was made for a further increase of 400,000 tons. Especially was impetus sought in the production of round timber for use in coal mines.

The home grown timber industry felt the effect of the withdrawal of men for service in the armed forces. The production facilities of the trade itself were greatly augmented by the ministry of supply's departmental mills and the operations of the Canadian, Australian, New Zealand and Newfoundland forestry companies working in Britain; some use was made of Italian prisoners-of-war in woodland work; and—a new development during the year—a Women's Forestry Corps of the Women's Land Army was formed.

Britain's timber supplies during the year were adequate to meet vitally essential needs; only 3% of the timber in Britain was being used for civilian or domestic use. (*See* also FORESTS.)

(N. F.)

Lutherans. The year 1942 was a year of great tensity in the Lutheran church, throughout the world. Significant communications and co-operative work, on a world scale, were impossible or were severely restricted. The large Lutheran populations in European countries were subjected to increasing trials of faith, courage and patience under the conflict between paganism and Christianity.

The courageous record of the Lutheran bishops, clergymen and laymen in Norway, in steadfast refusal to submit to the impositions of the dictated government, under German dominance, was notable.

War with Japan in 1941 led to the withdrawal, by exchange of citizens, of all American missionaries of the Lutheran church from Japan, and as many as could be arranged for from occupied China. Great problems arose also in the large Lutheran missions in India and New Guinea, and in missions cut off from the support of European churches.

Several large Lutheran bodies in America held regular official conventions in 1942 at which great progress was made toward Lutheran unity. Authorized altar and pulpit fellowship only awaited official proclamation for two-thirds of the Lutherans in America.

Contributions for regular and emergency services showed a marked increase from month to month in the American Lutheran churches during 1942, and an increased interest was manifested by church attendance, and by topics and discussions in important conferences. After making special contributions to war emergencies in 1942, amounting to more than $1,000,000, an appeal, to be made in 1943 for a 50% increase for that service, was authorized in the 1942 conventions.

Problems which emerged in 1942 to challenge the wisdom, faith, loyalty and generosity of the churches in 1943 were: Care of the multitudes of unchurched people in new industrial centres; Recruiting of men for the ministry to take the places of hundreds serving the country as chaplains, and for new work in industrial centres; Maintenance of colleges, in the face of great losses in enrolment; The service of the church in the establishment of peace, and in provision for relief and reconstruction after the war. (W. H. G.)

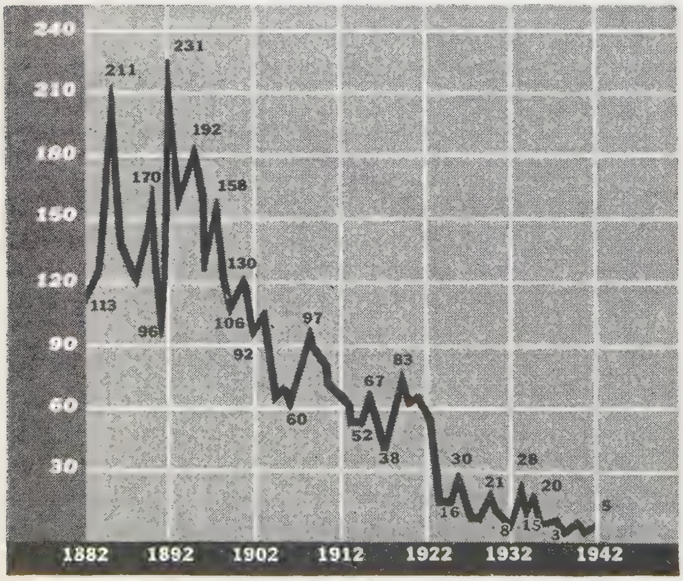
Luxembourg. A grand duchy situated between France, Germany and Belgium. Area, 999 sq.mi.; pop. (est. 1942) 301,000; chief city, Luxembourg (cap. 59,000); language, Luxembourgian (idiomatic) and (officially) French and German; religion, 98% Roman Catholic. Ruler in 1942 (since 1919): Grand Duchess Charlotte.

The grand duchess was forced to flee on May 10, 1940, as German troops swept into the country and placed it under martial law. This was replaced three months later by an even more oppressive civil administration under Dr. Gustav Simon, nazi gauleiter of the Trèves-Cologne district. In the plebiscite which he held on Oct. 10, 1941, asking the people to vote to become German citizens, 98% refused. The loyal Luxembourgers still adhered to the sentiment of their patriotic national song, "We want to remain what we are."

On Aug. 30, 1942, Luxembourg was incorporated by decree into the German reich, and a mobilization order summoned its citizens to military service in the German army. This action was vigorously protested by the Luxembourg prime minister, Pierre Dupong, and by the workers who called a general strike. As a result, orders were given that strikers were to be sentenced to death, and many were deported into Germany. (S. B. F.)

Lynchings. Coincident with a general increase of interracial tension during 1942, the lynching record as reported by Tuskegee institute also showed a slight increase, from four in 1941 to five in 1942. Three states were involved—Mississippi with three victims, Texas with one, Missouri with one. All the victims were Negroes. Though local officials were supposed to have investigated every case, and though the Federal Bureau of Investigation also went into some of them, none of the lynchers was apprehended and no indictments were returned. Briefly, the several incidents were as follows:

Sikeston, Mo., Jan. 25: Cleo Wright, exconvict, was accused of entering the home of a white woman and slashing her severely with a knife. Put under arrest, he stabbed the arresting officer and was shot in return. A few hours later, desperately wounded, he was taken from the jail by a mob several hundred, and was dragged through the streets and burned.



LYNCHINGS in the U.S. from 1882 to 1942, based on figures of the department of records and research, Tuskegee institute

Texarkana, Tex., July 13: Willie Vinson, aged 31, accused of attemp criminal assault, but not positively identified by the victim, was seve wounded while resisting arrest and was sent to the hospital. There he promptly abducted by three men, was dragged to the edge of town behin car, and was hanged by a mob numbering about 20.

Shubuta, Miss., Oct. 12: Charles Lang and Ernest Green, 14-year- boys, charged with attempt to rape a 13-year-old white school girl, w taken from the jail and hanged. Said Governor Paul Johnson, in order investigation of this case: "Every man who helped lynch those Negroe guilty of murder. I want the public to know that the governor of Mississ condemns the act and will exert every reasonable effort to see that the lated laws of Mississippi are vindicated." The FBI assisted in the inve gation, but no arrests were made.

Laurel, Miss., Oct. 17: Howard Wash, sentenced to life imprisonment the murder of his employer, was taken from jail and hanged by a mob 100. The state militia was ordered out to apprehend the lynchers, but w out result.

Begun by the *Chicago Tribune* in 1882 and for many ye kept up by Tuskegee institute, the lynching record down to 1 shows a total of 4,705 victims, an average of 77 per year. For four states have figured in the record, a few with one or t lynchings each, some with several hundred. The only excepti are the four states of Massachusetts, Rhode Island, New Ham shire and Vermont. (*See* also NEGROES [AMERICAN]). (R. B. E.)

McAfee, Mildred H. (1900–), commander of the U women's naval reserve unit (WAVE was born on May 12 in Parkville, Mo., and was graduated fr Vassar in 1920. She was acting professor of economics a sociology at Tusculum college, Greeneville, Tenn., 1923–26, a received her master's degree at the University of Chicago 1928. She was dean of women at Centre college, Danville, K 1927–32, and at Oberlin college, 1934–36, and was appoin president of Wellesley college in 1936. After the outbreak World War II, she was named a member of the education visory committee for the navy training program, working w naval personnel on plans for a women's reserve. When Pr Roosevelt signed the bill creating a women's naval reserve July 30, 1942, Miss McAfee was chosen to head the WAV (Women Accepted for Volunteer Emergency Service, *q.v.*) a she was sworn in Aug. 3, 1942, with the rank of lieutenant co mander. Expected to number 1,000 officers and 11,000 enlis women, the WAVES took over naval administrative and techni jobs in continental U.S., thus releasing many men for active du

MacArthur, Douglas (1880–), U.S. army officer, w born Jan. 26 in Little Rock b racks, Ark., the son of Lt. Gen. Arthur MacArthur. Gradua from West Point in 1903, he was commissioned in the engin corps. He rose to brigadier general in World War I, and w subsequently made division commander. He was gassed a wounded in action. When promoted to a major general in J 1925, he was youngest of that rank in the U.S. army. Ma chief of staff with rank of full general on Nov. 21, 1930, reorganized and strengthened U.S. defenses. President Roosev retained MacArthur as chief of staff beyond his regular term that he could complete army reorganization. In Oct. 1935, at request of President Manuel Quezon of the Philippines, he linquished his post as chief of staff, became military adviser the Philippine government and overhauled the commonwealt defense system. He retired Dec. 31, 1937, but Quezon kept h on as head of all Filipino military and constabulary forces. Roo velt formally nominated MacArthur to be a lieutenant gene in command of U.S. and commonwealth forces in the Philippin after the Philippine army was reincorporated into U.S. for July 26, 1941. Following Japan's attack on the Philippines was renamed a full general by President Roosevelt, Dec. 19, 19 nd led Filipino and American forces in the defense of the islands. Although heavily outnumbered in men, planes and tanks, IacArthur slowed the Japanese advance in early Jan. 1942 and etired in good order to Bataan peninsula. There his small but ell trained army of U.S. and Filipino regulars found cover in the ıountainous terrain; the Japanese made gains—as there was no ay of getting supplies to MacArthur—but at exceedingly heavy ost. He left the Philippines on Roosevelt's orders and reached ustralia March 17, 1942, to assume command of all United ations armies in the southwest Pacific. It was under his comand that U.S. and Australian troops launched, in the fall of 942, the counter-offensive in New Guinea that drove the Japs om Gona and Buna. He set up field headquarters in New uinea in November and personally directed operations. On Oct. 3, MacArthur, answering critics who hinted that he had presintial aspirations, declared that he had no political ambitions hatsoever.

lcClintic, George Warwick

(1866–1942), U.S. federal judge, born Jan. 14 in ocahontas county, W.Va. He received his law degree from the niversity of Virginia in 1886 and for over 30 years practised in harleston. He won national prominence in the prohibition ears when he sentenced more than 7,000 people to jail for viotion of the liquor law and collected nearly $500,000 in fines om offenders in a four-year period (1922–26). Judge McClintic as appointed to the U.S. district court of southern West Virnia in 1921 and retired in 1941. He died in Charleston, W.Va., ept. 25.

lachinery, Farm: *see* AGRICULTURE.

lachinery and Machine Tools.

In order to meet the greatly enlarged deand for their products during 1942, manufacturers of machine ols, with few exceptions, concentrated on the production of andard models rather than the development of new units and nprovement of older models. Standard designs were frozen to cilitate increased production. Where increased output of a parcular war product was demanded the solution usually was either e adaptation of an existing machine tool design by special toolg or the development of a special machine.

Some machine tool builders simplified their production probms by discontinuing temporarily the manufacture of one or ore sizes of machines. This permitted them to concentrate on aking larger quantities of fewer models. Also, there were inances when the War Production board approved arrangements etween companies for the manufacture by one concern of mahine tool models temporarily discontinued by another.

Conversion to war production stimulated tremendously the delopment and widespread adoption of new and improved methds. Processes such as welding, heat-treating, metal cutting, and etal cleaning and finishing, were improved in many instances suit the requirements of the materials being processed. Application of jigs and fixtures was stimulated, new principals of plant yout were developed and better means of handling parts meanically between production operations were worked out.

Because of the same factors which led to a materially increased oduction of machine tools during 1941—including expanded falities, longer working hours, subcontracting of parts manufacture, aining of new employees as machine operators rather than as lly qualified machinists, classes for older employees so they could e upgraded, and the employment and training of women—mahine tool manufacture during 1942 again broke all records. Value of product shipped from plants of machine tool builders during 1942 reached the unprecedented total of about $1,300,000,000.

Conversion of the automobile industry, including those plants making parts and accessories for that industry, to war production during 1942 was an outstanding achievement. Of course, the shift to war production within the automobile industry really started back in 1940 and progressed steadily during 1941. By the time the Japanese attacked Pearl Harbor this industry was producing a substantial volume of war goods. However, orders for an all-out conversion to war production did not come until early in 1942. In 1942 steady streams of tanks, planes, guns and other means for waging war were flowing out of plants that were producing pleasure cars during January and February of 1942. (*See* AUTOMOBILE INDUSTRY IN THE WAR.)

This complete change-over of an industry to war work was not easily accomplished. In many instances all production equipment had to be removed from plants and new equipment installed to make a product radically different in every respect from that manufactured in peacetime years. Untold hours were spent in selecting and installing machine tools, developing jigs and fixtures, determining the details of processes to be employed, and in training former automobile production workers to handle tools, materials and processes with which they were not familiar. Then, as more and more men were withdrawn from industry for service in the armed forces, additional problems in tooling and training were brought into the foreground by the employment of women workers to replace the men.

Shortages of certain critical materials led to a number of substitutions of materials, both in the construction of machine tools and in the war products being manufactured in large quantities. Often, these substitutions necessitated major design changes so that full advantage could be taken of the properties of the new materials. For example, one prominent manufacturer of turret lathes early in 1942 placed on the market two new saddle-type turret lathes in which high-strength cast iron spindles were substituted for the alloy steel spindles normally used. While equivalent in most physical specifications to previously made units, these two lathes were designed to be made with readily available machine tools from materials obtainable in large quantities.

The problem of salvaging and putting back into use every possible pound of critical materials was attacked from every angle. A new series of National Emergency steels was developed for use wherever possible in place of the more strategic high-alloy steels, plants making products requiring the more strategic alloys put into effect extensive scrap collecting and segregating systems. (*See* also SALVAGE DRIVES, U.S.)

Among the novel machine tools made available to the metal-working industry during 1942 was a unit which combined the functions of a horizontal boring machine and a jig borer. It was claimed that this unit had the production capacity of a milling machine, the spacing accuracy of a jig borer, and the flexibility of a horizontal mill. It had wide application in small plants and in tool rooms where there was need for both a horizontal mill and a jig borer, but where neither machine would be in use all of the time. By combining the features of both machines, the manufacturer of this unit made available a machine that would do both jobs but required only one operator and took up half of the normally required floor space.

Another new machine bores, faces and taps both ends of an aircraft bomb in one chucking. The bed of this unit supports a centre drive chuck and a turret carriage at each side of the chuck. The left-hand turret is equipped with a motor-driven drill unit, a boring bar with facing tools, an undercutting tool and, when necessary, a collapsible tap. The right-hand turret holds a boring bar with facing tools at one of the two stations and a

THE OXYACETYLENE TORCH, only tool that can cut metal apart and weld it together again, was widely used in the shipbuilding industry in 1942 to speed production. Here a battery of torches is cutting eight steel shipbuilding wedges simultaneously

collapsible tap at the other. This machine had special equipment to move the work rapidly in and out of the chucking position.

Many of the gears required for war products must be finished with more precision than most of those made in peacetime. As a result a number of new machines were developed for finishing gears with high precision. One of these units made available three methods for finishing gears by shaving. Another was a precision grinder for finishing generated curved-tooth bevel gears. In grinding a gear with this machine, the wheel is alternately fed into the work during the up-roll of the cradle and withdrawn during the down-roll. The work, in the meantime, rotates continuously so that the wheel when starting on the next up-roll engages a following tooth. The cycle is repeated until all teeth are ground. Control of tooth bearing is obtained by dressing the wheel to a modified shape and by modifying the generating roll. The wheel dressers are hydraulically operated and dressing is entirely automatic. Dressers may be adjusted for feed, pressure angle, radius and wheel diameter.

Equipment for sharpen tool forms and angles ac rately is particularly necessa as precision-ground tools s valuable metal-cutting ma rials and improve the quality the product. In fact, in ma instances it would not be p sible to make some parts if tools were not precision grou One machine developed dur 1942 for this type of work adaptable to sharpening t tipped with either tungst carbide or high-speed steel. T unit is a full-universal t grinder fitted with a par graph-controlled optical che ing instrument. Tools can ground and then inspected w out removing them from t machine. Profile gauges, ter lets and other irregular for also can be ground to size a shape in this machine.

A recital of the developme in metal working during 19 would not be complete with mention of the contributi made during the year by t aircraft industry. Considera ingenuity was used by men this industry in developing d and other tools for form sheet metal parts. One popu method was the use of s metal that could be cast shape—and so avoided spe ing many hours in the tool ro making steel dies for the sa purpose. Plastics were used such tools. Some of the p tic materials were cut to required shapes on woodw ing machines while others were cast to shape in plaster mou These materials also were employed with considerable success making jigs and fixtures. (B. C. B.

Mackenzie King, William Lyon: *see* King, William Ly Mackenzie.

McNamee, Graham (1888–1942), U.S. radio announ was born July 10 in Washington, D Possessor of a pleasing baritone, he trained to be a singer left the concert stage in 1923 to work as announcer and singer a New York radio station. Later that year he was assigned cover a prize fight for radio audiences; his extemporaneous "bl by-blow" description of the bout set him on the road to nati wide fame as a "sportscaster." He developed the running-st technique of radio reporting to a fine art, and his dramatic, f moving accounts set the pace for later announcers. He cove major sports events and later widened his field of action to clude political conventions and big news happenings. McNan who was also a newsreel commentator, died in New York c May 9.

cNaughton, Andrew George Latta (1887–), Canadian army cer, was born at Moosomin (Sask.) Feb. 25, the son of Robert ncan and Christina Mary Anne (Armour); he was educated Moosomin public school, Bishop's college school, Lennoxville, ., and at McGill university (1906–10), B.Sc., 1910, M.Sc. 12, Senior demonstrator in electrical engineering (1912–14). neral McNaughton served conspicuously in World War I, dur- which he commanded in succession the 4th battery, 2nd bri- le, Canadian field artillery; the 21st howitzer battery; the 11th gade C.F.A.; and next was appointed counter-battery staff cer of the Canadian corps. Wounded at the second battle of res (April 1915) and again at Soissons (Feb. 1918), he was ee times mentioned in dispatches, awarded the Distinguished vice Order (1917) and made a Companion of the Order of St. chael and St. George (1919).

Upon returning to Canada in May 1919, General McNaughton s appointed member of the committee for the reorganization of itary forces of Canada, and in 1922 he was promoted to deputy ef of the Canadian general staff. In 1929 General McNaughton s again promoted, this time to chief of the general staff, a posi- which he held until asked to be president of the Canadian tional Research council (1935).

He served in this capacity until Oct. 6, 1939, when he was pointed commander of the Canadian active service forces.

In Feb. 1942 he paid an official visit to Canada and also con- red with Pres. Roosevelt. He returned to England in April and k command of the newly-formed Canadian army in Great tain. Gen. McNaughton was instrumental in training the nadian troops who took part in the Allied raid at Dieppe Aug. 1942. (J. T. C.)

cNutt, Paul Vories (1891–), U.S. politician and government official, was born July in Franklin, Ind. Educated at Indiana university (A.B., 3) and at Harvard (LL.B., 1916), he served on the faculty Indiana university law school, 1917–25, and was dean of the school, 1925–33. He was elected governor of Indiana in 2 and assumed office in 1933. McNutt was also elected na- nal commander of the American Legion, 1928. He was U.S. h commissioner to the Philippines, 1937–39, and was named t administrator of the Federal Security Administration in 1939. April 18, 1942, President Roosevelt made McNutt head of War Manpower commission (*q.v.*), a new agency to assure ft mobilization and distribution of the nation's manpower in industries. McNutt's efforts to solve the acute shortage of ustrial manpower in early 1942 were hampered by his lack of quate authority. On Nov. 16, he admitted charges that the ernment was wasting federal manpower and that some federal ncies were "pirating" or "hoarding" workers. But Pres. Roose- t acted on Dec. 5, 1942, to remedy the situation by vesting McNutt full power to hire and distribute workers for civilian industries and implemented his authority with full control of Selective Service system.

acSwiney, Mary (? –1942), Irish Republican leader, a teacher by profession, became identified h the Irish Republican movement in 1913. After the Irish olution, she was a member of the Dáil Eireann, 1921–25, but ke with her comrades, including Eamon de Valera, on the issue complete separation of Ireland from Great Britain. Miss Mac- iney maintained that the Irish republic established before the glo-Irish treaty of 1921—which gave Ireland dominion status was the only legitimate government and would not recognize the e government. In 1929, she made an attempt to set up a parliament of "true representatives" of Ireland. She was the sister of Terence MacSwiney, lord mayor of Cork, and a revolutionary, who died after a 74-day hunger strike in a London prison in 1920. Miss MacSwiney was arrested two years later for her militant opposition to the provisional government but was released after a 24-day hunger strike. She died in Cork, March 7.

Magazines and Periodicals: *see* Newspapers and Magazines.

Magnesite The mine production of magnesite in the United States in 1941 increased 12% over 1940, to 374,799 short tons; sales during the year included 4,536 tons of crude, 30,225 tons of caustic calcined and 135,956 tons of dead-burned magnesite; sales of refractory magnesia obtained from sea water, bitterns and dolomite amounted to 65,525 tons. Imports of dead-burned magnesite in the first nine months of 1941 were 36,574 short tons, of caustic calcined 527 tons and of crude magnesite none, the total being well ahead of that for the full year 1940. Even discounting any imports that might have been received in the last quarter of 1941, the available supply of dead-burned and refractory material for the year was 39% greater than in 1940 Production was presumably expanded even more in 1942, as in addition to the increasing demand in the usual uses, by the end of 1942 consumption of magnesia for the production of magnesium metal was expected to be at the rate of 200,000 tons a year.

(G. A. Ro.)

Magnesium. There was no announcement of the output of magnesium in the United States in 1941, but it was thought to be three to four times the 6,261 short tons turned out in 1940. In order to satisfy the demand for metal for aeroplane construction, incendiary bombs, tracer bullets and other uses, a number of new plants were completed and put into operation by the end of 1942, and others were under construction for completion early in 1943. The planned output for the entire construction program was 362,500 short tons, or more than eight times the 44,000 tons which constituted the world output of 1940. Incidentally, the United States consumption of magnesium in 1918 was reported at 142 tons.

(*See* also Metallurgy; War Production, U.S.)

(G. A. Ro.)

Mahin, Frank C. (1887–1942), U.S. army officer, was born May 27 in Clinton, Ia He received his early education in England. After graduating from Harvard in 1909, he joined the U.S. army. He was promoted to major during World War I and fought with the A.E.F. at St. Mihiel and the Meuse-Argonne. A graduate of the Command and General Staff school and of the War college, he was put in command of the 3rd infantry in 1937. In 1941, he was promoted to brigadier general. He became a major general shortly after taking over command of the 33rd division at Camp Forrest in May 1942. Gen. Mahin was killed in the crash of an army observation plane near Waynesboro, Tenn., July 24.

Mail-Order Business: *see* Business Review.

Maine. The extreme northeastern state of the United States, admitted as a state in 1820 and popularly known as the "Pine Tree state." Area 33,215 sq.mi.; pop. (1940) 847,226. Rural dwellers numbered 504,169, while 343,057 were classed as urban. The capital is Augusta (19,360). The largest cities are Portland (73,643); Lewiston (38,598); Bangor (29,822).

History.—The state legislature met Jan. 12, 1942, for a special session which adjourned Jan. 24. A defense measure granted broad emergency powers to the governor and another authorized the issuance of war bonds. State employees receiving less than $30 weekly were given a 10% raise. A jointly contributory retirement system for state employees was set up under a board of trustees and provided with $250,000 as a start toward a pension reserve. Governor Sewall had vetoed a similar bill in 1941 because it was not clear that existing tax laws would provide adequate funds. The permanent legislative investigating committee continued its studies of state agencies and prepared a report for the 1943 legislature. Loss of state employees to federal agencies and war industries caused a critical shortage of workers in the state hospitals for the insane. Numerous pay increases were granted by the state personnel board in order to prevent a breakdown of state services. Republican governor Sumner Sewall of Bath was elected in September for his second term (1943–44). Senator White (Rep.) was re-elected for a full term. Three other Republicans represented Maine in the house: James C. Oliver (1st dist.); Margaret C. Smith (2nd dist.); Frank Fellows (3rd dist.). Fellows and Smith were re-elected; Robert Hale of Portland defeated Oliver in the June primary, and beat former Democratic governor Brann in September. Balloting was the lightest since 1930.

Education.—Colby college was forced to suspend construction on its new campus, although some of the buildings were ready for use, and a number of others partially built. The University of Maine likewise stopped work on its new library. Maine's three colleges and university adopted accelerated programs by adding long summer terms. Special training programs were begun for industry and the armed services. The state normal school at Castine became the Maine Maritime academy, directed by a retired naval officer and financed with state and federal money.

Finance.—State receipts, expenditures and bonded debt, 1940–42, were as follows (fiscal year begins July 1):

Table I.—*Receipts, Expenditures and Bonded Debt of Maine*

	Fiscal year 1940–41	Fiscal year 1941–42
Total available	$39,194,096	$44,427,661
Total authorized	36,792,907	38,294,509
Net gain from operations	2,401,189	6,133,152
Bonded debt	28,108,500	26,169,500

State liquor store income reached a new high; a new tax on cigarettes brought in more than had been expected, while gasoline revenues declined somewhat.

Agriculture.—Weather conditions in Maine during the 1942 crop season varied widely, with heavy spring rains in some areas and generally dry weather during August. On the whole there was more rainfall than in 1941, bringing lakes, streams and wells to more nearly normal levels at year's end. Fish and vegetable canneries put up a record pack, destined in large part for the U.S. armed forces. The acreage of crops harvested in 1942 was 1,231,190, slightly larger than the 1,211,100 for 1941, the increase being largely in hay and potatoes. Based on prevailing prices through December, the value of Maine's farm products in 1942 totalled $56,009,000, or 13% larger than the previous year. I
duction figures in the important poultry and dairy industries w
not available; milk production was about the same as 1941, w
poultry production was up; prices in both fields were gener
higher than at any time since World War I.

Table II.—*Leading Agricultural Products of Maine, 1942 and 1941*

Crop	1942 (estimate)	1941
Corn, bu.	672,000	656,000
Wheat, bu.	40,000	36,000
Oats, bu.	4,017,000	3,996,000
Barley, bu.	112,000	135,000
Buckwheat, bu.	119,000	105,000
Hay, tons	901,000	692,000
Potatoes, bu.	42,120,000	43,035,000
Apples, bu.*	730,000	581,000
Beans, tons (dry)	4,150	5,150

*Figures include only the so-called "commercial" apple counties.

Table III.—*Principal Industries of Maine, 1939 and 1937*

Industry	1939	1937
Boot and shoe	$46,162,403	$42,568,005
Cotton mill	28,342,860	28,937,439
Woollen mill	36,118,681	28,409,949
Pulp and paper	25,370,932	28,890,516

Manufacturing.—The total value of manufactures (1
census) was $345,368,595. Total employment was 81,995,
wages paid $82,026,503.

Maine shipyards ran at full production during 1942, turning
submarines, destroyers, cargo ships, barges and a variety of sm
craft. Transportation and housing problems were critical, e
cially in Portland and Bath. Air and naval bases became of stra
gic value, with blackout and dimout regulations in force o
large sectors. In regions not having much defense work there
a small surplus of labour, mostly unskilled, with serious short
of skilled defense workers and some shortage of farm lab
Many small businesses closed or declined because of shortage
goods or help. The tourist trade was hard hit by wartime tr
restraints. War demands brought an increase in lumbering
woodworking, as well as in the textile and shoe industries.

Mineral Production.—The total value of minerals produ
in Maine in 1939 was $3,769,671, as compared with $3,548
in 1938. Stone, sand and gravel production declined in 1942
curtailed road building, while feldspar production increased. I
production, a relatively new industry, was given impetus by
lack of European peat. (E. F. D

Table IV.—*Mineral Products of Maine, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Stone	$1,228,930	$1,161,535
Sand and gravel	888,646	968,766
Clay	371,629	210,814

anchuria

(“MANCHOUKUO”). An empire, practically a Japanese dependency, located in northeastern Asia, ounded N. and E. by soviet Siberia, W. by Siberia, Outer Monlia and China, S.E. by Chosen. Area, 548,000 sq.mi.; pop. 939), 39,454,026. The territory was renamed “Manchoukuo” by e Japanese in 1932 after they had occupied it. Capital, Hsinking he former Changchun). The largest cities are Mukden (863,5), Harbin (517,127), Hsinking (415,264), Antung (220,587). ter estimates reckoned a population of more than 1,000,000 for ukden and about 650,000 for Harbin. The former is the centre Manchuria's heavy industries, the latter of its light industries, ch as flour milling and food processing. The principal religions of anchuria, in the order of numbers of adherents, are Buddhism, oism, Lamaism, Mohammedanism and Christianity. There are out 130,000 Roman Catholics and 125,000 followers of other ristian denominations. The emperor is Kang Teh; the premier, 1942, was General Chang Ching-hui. (Late in Dec. 1942 there s a report from Chinese sources in Chungking, later denied by pan, that the premier had committed suicide.)

History.—The state of “Manchoukuo,” the legitimacy of which s never been recognized by China, the United States, Great itain and a number of other powers (as a general rule the tes associated with the axis have accorded recognition to “Manoukuo”), came into existence as a sequel to the action of the panese army in seizing Mukden, former seat of the Manchurian ministration, on Sept. 18, 1931. The occupation was subseently extended to the whole country. A committee of Manurians who were willing to accept Japanese domination proimed an independent state Feb. 18, 1932. Henry Pu Yi, a on of the Chinese Manchu dynasty, was inaugurated as chief ecutive of the new government on March 9, 1932; he was oclaimed emperor, under the name of Kang Teh on March 1934.

There are no representative institutions in Manchuria; and the gime there was essentially a creation of the Japanese army, ich, in the early '30s, used it as a testing ground for theories militarist collectivism which were later applied to Japan. The mmander-in-chief of the Kwantung army, the Japanese force occupation, is also *ex officio* Japanese ambassador to Hsinking. e chief executive organ is the state council, which is in charge all administrative affairs. There is also a privy council as a ief consultative body for the emperor; but its function is pririly honorary. The Concordia association, which claimed a embership of 1,137,883 in 1939, was set up as an agency of te propaganda; one of its avowed purposes is to “establish eparable relations between Japan and Manchoukuo.” While st of the ministers in the cabinet are natives of the country, l power is in the hands of the Japanese vice-ministers; and panese influence is predominant in the powerful general affairs ard.

Education.—Manchuria in 1939 possessed 15,877 primary hools with 1,589,169 pupils. There were 238 middle schools, th 54,768 students; 40 normal schools, with about 8,000 stunts; and 13 institutions for higher education, with 3,820 idents. Government expenditure on education in 1939 was ,967,000 yuan.

Defense.—The army was first recruited on a volunteer basis, th a strength estimated at 80,000-100,000 men. The number of Japanese troops was estimated at 500,000. The character of the native army was changed when an imperial ordinance of April 15, 1940, established conscription and prescribed a three-year term of military service. Between 1934 and 1939, five military schools were opened for training Manchurian officers, two in Hsinking, one each in Mukden, Harbin and Wangyehmiao, in the Hsingan province.

Finance and Banking.—The yuan, unit of exchange, is equivalent in value to the Japanese yen, pegged at 23.48 cents U.S. in Dec. 1941. The budget for 1940 was 573,550,000 yuan, as against 403,377,000 yuan in 1939. Japanese rule at first brought currency stability; but inflationary symptoms in prices were becoming evident by the end of the '30s.

Trade and Communication.—The latest official figures available in 1942 for the trade of Manchuria were for the first nine months of 1940 and showed exports of 544,629,000 yuan, imports of 1,397,715,000 yuan. There were about 11,000 km. of railways in 1940 and about 30,000 mi. of highways, of which 13,000 mi. were suitable for motor traffic.

Agriculture, Resources, Manufacturing.—Manchuria's staple crop is the soybean, production of which varies from 130,000,000 bu. to 210,000,000 bu. annually. Kaoliang, millet and corn are other cereal crops. There were 1,683,000 cattle, 2,000,000 sheep, 1,250,000 goats, 5,500,000 hogs and 2,000,000 horses in 1937. The country produced 685,000 tons of rice and 74,667 bales of cotton in 1940. The forest resources are considerable in the northern provinces. Coal and low-grade iron are the principal mineral resources; the output of coal in 1939 was 19,000,000 tons.

(W. H. CH.)

Mandated Pacific Islands: *see* PACIFIC ISLANDS, MANDATED.

Mandates.

The mandates section of the secretariat of the League of Nations spared no pains to keep all available official and unofficial documentary material up to date throughout 1942. There was no break in continuity. Though unable to meet, owing to the war, the mandates commission received the mandatory powers' annual reports.

The moral and practical value of this international experiment

PORT MORESBY, NEW GUINEA, was bombed frequently but with no decisive military effect by the Japanese in 1942

*Syria and Lebanon were recognized by Great Britain and the Fighting French as independent republics in Sept. and Nov. 1941 (*see* LEBANON; SYRIA).

is undoubted. For the principles on which the mandatory system is based cannot be ignored in the future study of colonial problems. These principles may be briefly listed as consideration of the social, moral and political welfare of natives as the primary object of administration; custodianship of peoples not yet able to stand by themselves, with the ultimate aim of self-government; collective supervision (with possibilities of wide extension) by an international body; application of economic equality to mandated territories. (M. FE.)

Manganese. The limited information available on world manganese production is condensed into the table in the next column.

World steel output even under war demand requires only about 3,600,000 tons of manganese ore annually, and the annual surplus outputs have been going into stock piles. However, it is doubtful if the output of manganese in 1942 was any more than sufficient to meet the demand, and its distribution to the centres of consumption was seriously handicapped by transportation difficulties. Russian shipments were entirely cut off, as were also the less important sources of the Philippines and Netherlands East Indies, the latter having fallen into the hands of the Japanese. Gold Coast shipments were largely diverted from the United States to Great Britain, and those from India were forced to take the lo route around the Cape of Good Hope. It seemed that fairly quate supplies were maintained for the United Nations.

Although numerous projects were under way for enlarging United States output, progress was slow, and the 1941 ou was only about 76,000 long tons of high-grade ores, though in mediate grades increased 43% to 459,000 tons. Imports, w were 1,294,300 tons in 1940, remained at about the same lev 1941, with receipts of 853,200 tons in the first nine months considerable surplus of South African ore went into stocks, a smaller amount of Brazilian and Indian ores, but Gold C

anitoba.

A central province of Canada; area 246,512 sq.mi. (26,789 sq.mi. water); pop. (1941 final census ures) 729,744; urban 44%; Canadian-born 73%. Capital, Win- peg; pop. 217,994. St. Boniface and Brandon are the next two rgest cities, with populations of 18,157 and 17,383 respectively.

History.—In Dec. 1942 John Bracken accepted the leadership the Progressive Conservative party of Canada and thus ended premiership of more than 20 years. His successor as Premier is S. S. Garson. The Co-operative Commonwealth federation thdrew its support from the coalition government of Liberal- ogressives, Conservative and Social Credit members. The lieu- ant-governor in 1942 was R. F. McWilliams.

Education.—Public, elementary and secondary schools are intained by general taxation. Pupils in public elementary ades in 1941 numbered 109,477 and in secondary grades 22,085; private schools in 1940 the enrolment was 4,632. Public school chers numbered 4,491.

Agriculture.—Fulfilment of war needs was the predominating ctor in agriculture, and livestock again increased considerably. reals, with a record production and enhanced prices, were re- onsible for a large increase in the (gross) estimated crop value $177,000,000 for 1942.

Manufacturing, Minerals, Fisheries, Furs.—Manufactures 940) were valued at $167,919,165; minerals (1940) $17,823,- 2; fisheries (1941) $3,274,887; furs (1941–1942), wild catch 735,895; farms $422,452; processed in Winnipeg, $717,778; ocessed in and exported from Manitoba, $5,623,410.

Communication.—In 1942 the total railway mileage was 53, including the Hudson's Bay railway. Highways: surfaced, luding trans-Canada, 8,446 mi. (gravelled, 7,910; bituminous, 9; concrete, 37). The government-owned telephone system d 84,057 telephones, 129 exchanges and a total wire mileage 328,095; it operated two radio stations, one of 15,000 watts at innipeg and one of 1,000 watts at Brandon. Marble: *see* STONE.

Margueritte, Victor

(1866–1942), French novelist, was born Dec. 1 at Blida, Algeria. He collaborated with his brother Paul in many novels and histories, and both achieved distinction for their attacks on the marriage and divorce laws of France. After Paul's death in 1918, Victor wrote a number of novels, the most famous of which was *La Garçonne,* published in 1922. Many French critics attacked the work as a "slander against the decency of French womanhood"; others upheld it as a ruthlessly candid portrayal of social decadence in the post-war France of the 1920s.

Among Margueritte's other works were *La terre natale* (1917); *Le Compagnon* (1923); *Le chant du berger* (1930); *Non!* (1931); *Nos Égales* (1933); and *Babel* (1934). He also wrote a number of plays.

Margueritte died at Monestier, near Vichy, on March 23. (See *Encyclopædia Britannica.*)

RURAL SCHOOL CHILDREN OF VERMONT were given a week's vacation in the spring of 1942 to help in the annual maple syrup harvest, as many of the regular adult harvesters were in the armed forces or working in war plants

Marine Biology.

Repercussions of the events at Pearl Harbor disrupted marine programs as well as cancelled the forecasted expeditions of practically all countries of the western hemisphere. Progress in the study of marine biology found itself almost at a standstill in 1942, with personnel shifted where talents of the worker might fit more directly into the war effort.

Nature[1] cites some facts and figures concerning the extent to which certain seaweeds can be used in the dietary of livestock (cattle, sheep, pigs and poultry) as well as to supplement and validate their use by man himself. After processing, including dehydration, 8-9 tons of the seaweed *Laminaria flexicaulis* gathered off the Brittany coast yielded one ton of fine seaweed meal—three pounds of which furnished the nutritive equivalent of four pounds of oats in feeding experiments. In a trial dietary at the Overbrook dairy (U.S.A.), addition of seaweed meal to a balanced ration gave evidence of increased stamina among the herd as well as a stronger resistance to disease. On the California coast, the meal from processing the giant kelp *Macrocystis pyrifera* was being extensively used in a similar way as a dietary supplement for domestic animals. Researches in light penetration and its effects on sea life continued to engage the attention of workers at certain U.S. stations. Working at Bingham laboratory of Yale university,[2] one worker estimated that the sun's rays reach their most effective biological equilibrium at depths between 5 m. and 30 m., depending upon the turbidity of the water.

In an attempt to answer the question as to whether or not plankton-rich muds of the sea floor contain greater amounts of radium than do those muds where few plankton are found, two workers on bottom sediments from off the Canadian Pacific coast favoured the conclusion that radium carrying by plankton to the bottom-muds is negligible. This in spite of the fact that in the open waters plankton may be 1,000 times richer in radium than those found on the sea floor.

An interesting and timely bulletin from the U.S. National museum,[3] the sixth volume of the Henry W. Fowler's studies of the fishes collected by "Albatross," deals mostly with the primitive fishes of the Philippine islands. While this volume of some 900 pages will be useful to the systematist, the layman will find useful notes on the breeding and food habits of these colourful forms.

Nature[4] cites a series of reports concerning the marine fauna of the Bristol channel, which were initiated in 1937. This survey covers the intertidal fauna, involving the amphipods, porifera, coelenterates and other invertebrates as well as many kinds of fishes. These data furnish a means of comparison between the faunal surveys of the Isle of Man, Lancashire, Cheshire, the North Wales and other coastal areas already made by the University of Liverpool biologists.

As a sidelight on sea warfare, the *Audubon Magazine*, as reported in *Science*,[5] brings a distressing picture of the fatal suffering of many of the sea birds caused by contact with floating oil. It is well known that mineral oils of whatever sorts, break the natural "film" of bird's feathers, and thus render them useless to the bird, either as a cover, or as an instrumentality of flight. Thus "oil slicks" on the water are really death traps to such forms as ducks, gulls and all other sea birds which use the surface of the sea at rest intervals. It seemed probable from reports originating in the North Atlantic (off Nova Scotia) that death of birds from U-boat sinkings over the surface of the oceans must be appalling.

Progress in Swedish oceanographic research for 1941 was ported in abstract form in *Science*.[6] Biologists will be intere in the vitamin D studies of phytoplankton in the Baltic sea is suggested that there is a positive correlation between "quality" of the phytoplankton as well as its "quantity," in tion to the survival of certain fish-larvae during the critical w of their existence when their percentage of survival is lar determined.

Since shark liver oil[7] is as valuable and as sorely neede rubber and tin, shark fishing off the Florida coasts was turned a vital and profitable industry. Since the western margin of gulf stream furnishes a rich feeding ground for great number well as great varieties of these cold-eyed scavengers of the sea including the nurse, hammerhead, tiger, leopard, lemon mack and the great white sharks—Salirno, on the St. Lucie river is centre of this flourishing industry. While the liver oil is the substance sought because of its vitamin A and D content; whole animal is as thoroughly processed as any pig in the st yards. (*See* also OCEANOGRAPHY; ZOOLOGY.)

Marine Corps.

By an act of the Continental congress N 10, 1775, it was established as a par the U.S. navy for duty afloat and ashore. The strength is kep about 20% of the naval personnel, 200,000 total officers enlisted men (Dec. 15, 1942).

The marine corps is assigned four distinct missions with navy: maintenance of an amphibious striking force as par the fleet; maintenance of marine detachments aboard ba ships, cruisers and aircraft carriers as parts of the regular cre provision of garrisons at all shore stations of the navy both wi and outside continental limits; and provision of landing forces the navy.

The organization and training of the corps is specially desi to meet the requirements of the missions, including infa

HOISTING THE U.S. FLAG on Midway Island at the height of the battle 4-6, 1942

MPLE GRAVES OF U.S. MARINES killed in action during the first attack on adalcanal in Aug. 1942. Palm fronds cover the mounds, marked by wooden sses

illery, aviation, paratroops and tanks.

The fleet marine forces under the orders of the admirals of the ets are made up of heavily armed and armoured triangular visions composed of the several arms and specially outfitted d trained for overseas operations with the fleet and its task ces with attached aviation units to meet the requirements of campaigns.

Special transports were provided to meet the requirements of forces and landing boats and amphibious tanks designed for cient landing operations under heavy enemy opposition were ried with the forces.

During 1942 marine organizations were active in battle in the ilippines with the armies under General MacArthur and the et under Admiral Hart, and in the defense of Midway island inst heavy attack of the enemy by sea and air.

Divisions of marines supported by naval ships and aircraft ded in the Solomon islands under heavy opposition of the emy and established a base there which they held in spite continued enemy attack from land, sea and air. This force was mmanded by Major General A. A. Vandegrift and it was sistently extending its holdings against strong enemy defense.

Recruit training stations are at Parris Island, S.C., and San ego, Calif., and large bases for the training of divisions are at antico, Va., New River, N.C., and San Diego, Calif. During 2 all enlisted men were obtained by voluntary enlistment but the future were to be taken from selective service enrolments.

Officers are commissioned from graduates of the U.S. Naval demy and distinguished military colleges, from qualified en- ed men and from selected civilians for special duties.

Aviation training with naval aviation afloat and ashore is ried out and aviation units are attached to the divisions and risons as required.

The ranks of officers and enlisted men correspond to those of navy but the titles are those of the army from private to lieu- ant general.

The statutes provide that any portion of the marine corps may transferred to the army for temporary duty during war.

The commandant of the marine corps in 1942 was Lieutenant neral Thomas Holcomb who with an operative and administra- e staff was stationed at the navy department, Washington, D.C.

Market Gardening.

The crop of vegetables for the fresh market in the United States in 1942 was officially estimated at 7,100,000 tons from 1,687,000 ac. The 1941 planting was 13,000 ac. larger but the crop was smaller—6,560,000 tons. The 1942 production of five major truck crops, asparagus, cantaloupes, green peas and watermelons, was smaller than in 1941. Prices averaged higher for all major crops except onions and cabbage. A 22% increase in the onion crop was accompanied by a season-average price of only $1.77 per 100 lb., compared to $2.26 in 1941. Cabbage production for the fresh market increased 35% in 1942 over 1941. This, together with a sharp reduction in tin allotments for packing kraut, compelled growers of cabbage for processing to seek an outlet in the fresh market, with prices of $16.47 in 1942 comparing to $20.87 per ton in 1941. The department of agriculture asked for approximately the same acreage in market gardening in 1943, but with reductions in some crops and increases in others. Increases of 10 to 30% were asked in the 1943 acreage of carrots, snap beans,

Table I.—*Acreage of Truck Crops for Market in 1942, as Indicated for 1943, and the 10-year (1932-41) Average Acreage*

Commodity	1942 acres	Indicated 1943 acres	10-yr. average 1932–41 acres
Artichokes, California	9,600	8,800	8,970
Asparagus			
Early	82,340	81,060	84,770
Late	49,055	51,530	31,270
Beans, snap, fall	19,300	15,200	18,020
Beets, early	7,100	7,600	6,630
Cabbage			
Early	65,080	56,100	43,680
Second early	19,300	18,300	20,650
Fall	3,050	3,450	2,270
Carrots			
Early	14,750	18,000	11,020
Fall	8,680	8,750	7,470
Cauliflower, fall & winter	9,990	8,050	9,480
Celery			
Fall & Winter	9,500	8,550	8,780
Early	8,230	7,300	6,230
Cucumbers, fall	2,000	1,900	1,690
Eggplant, fall	2,000	1,300	1,350
Escarole, Florida	1,200	1,250	870
Kale, Virginia	1,800	1,600	1,410
Lettuce, early	38,300	34,850	38,050
Onions, early	42,500	34,300	50,230
Peppers, green, fall	4,600	3,000	3,320
Shallots, Louisiana, fall	2,800	2,700	2,720
Spinach			
Early	47,000	45,050	42,230
Fall	1,300	2,100	2,480
Tomatoes, fall	17,300	10,500	8,360

lima beans, onions, sweet corn and kale. The department announced it would work out price supports for fresh vegetable production as might be necessary. It was estimated that, with a favourable season, the 1943 goal would provide for a civilian per capita consumption about 7 to 10% under the five-year (1935–39) average, after military and other government requirements had been met. (*See* also TRUCK FARMING.)

Table II.—*U.S. Production of Truck Crops for Fresh Market, 1942 and 1941*

Commodity	1942	1941
Artichokes, California	864,000 boxes	700,000 boxes
Asparagus	9,039,000 crates	9,219,000 crates
Beans, lima	1,568,000 bu.	1,530,000 bu.
Beans, snap	15,657,000 bu.	13,234,000 bu.
Beets	2,128,000 bu.	2,108,000 bu.
Cabbage	1,289,600 tons	956,900 tons

Marriage and Divorce.

Neither preparation for war nor the carrying on of war is normal in the American tradition and the necessity of accepting both and adjusting to them in 1942 disturbed domestic life in the U.S. just as it did other aspects of social life. A multitude of husbands had longer hours of labour, assignments to new kinds of work, frequently removal from one locality to another, and many of them had new financial burdens while others during 1942 felt unusually prosperous. The wives, in addition to their sharing these wartime problems of their husbands, also had additional responsibilities as mothers and housekeepers and had to adjust previous household routine to the new conditions, frequently limiting in character, that the transition to a war economy brought to them.

The movement of the vast number of young men and women from their homes to the army or to industry tremendously affected family life. This exodus of young men was especially disturbing in rural sections since often their departure placed excessive burdens on the elderly parents at a time when an increase of food production was imperative. The mother employed in war industry often found it difficult to obtain adequate care for her children during her absence from home. One of the consequences of this was the beginning of an increase in juvenile delinquency among older children. Chiefly this registered the general social upheaval and instability but in part it also revealed the inadequate functioning of homes. From the experiences of other countries there was reason to expect that this trend, already apparent, would be accelerated in the United States during 1943.

The marriage rate increased. This immediately followed passage of the Selective Service act. It was explained by various types of marriages: the hastening of a marriage already contemplated which otherwise would have been longer delayed; marriages that were entered upon with the hope of avoiding the draft (doubtless this purpose also played its part in the increase of the birth rate); marriages that came about because soldiers at camp were lonely and therefore moved rapidly through acquaintance and courtship into marriage with some young woman with whom they came in
contact. A special and highly hazardous example of this la
type was the marriage of American soldiers with women in
eign lands. There were finally those marriages which deserv
be called reckless, irresponsible marriages. The explanation
these ranges from intoxication to a fatalistic mood which sh
off thought of future consequences. Unions of this sort w
expected to become, after the war, a prolific source of divorce

Judging from World War I, even though it was of short d
tion, the marriage rate was expected to fall rapidly after W
War II. The chief reason for this would be the effects of
deaths and incapacities that must be expected in the armies o
seas. A great proportion of those who postponed marriage u
the end of the conflict would never marry. Unless the Un
States were seriously invaded the death rate of young men du
the war would be so much greater than that of young women
when war ends there would remain a disproportion of males
compared with females of marrying age: the greater the len
of the war, the larger this difference.

Divorces decreased during World War I and the same tr
must be expected in World War II. Many wives who would s
divorce were held back by their feeling that they had better k
the security of the compulsory allowances to dependents f
their husbands in service. Other women became reconciled
result of the emotional crisis resulting from the husband's en
ing or being drafted. Still others, both husbands and wives, g
up their desire for divorce because the separation when one en
the armed forces removed the tension that was leading them
the courts. The difficulty of the wife getting a divorce from
husband while he is in some branch of the military forces
courages attempting what cannot be accomplished unless the
band consents.

The increase in marriages brought a corresponding increas
the birth rate. Part of this increase came from the decision
couples who were childless by choice seeking parenthood beca
of their interpretation of the Selective Service act. However
desire for parenthood also was stimulated by the hazards faced
those from homes where husbands voluntarily accepted some
of military service. The change in mood brought by the wa
many husbands and wives chiefly explained the reversal of t
former policy and the acceptance of parenthood. Reaction
their feeling of insecurity awoke their desire for children.
birth rate, which was 17.9 per 1,000 during prewar 1940, the h
est since 1931, reached 18.9 in 1941 and seemed certain to
still higher in 1942. Then it was expected to decline, the amo
of change depending upon the length of the conflict.

Although there was general domestic disturbance, a consi
able feeling of insecurity due to the war, there was also gre
awareness of this and more constructive efforts to meet it t
was true during World War I. Many young people sought co
sel in the effort to meet their problems wisely and unemotion
Fortunately on account of the development of domestic coun
ling and the recognition by ministers, social workers and other
their responsibility for such services, there were greater resou
for help than during World War I. This asking of guida
appeared even among high school boys and girls who felt
pressure of war conditions. There was an increase in inte
also in sex education and a more general appreciation of the n
of this as a preparation for adult experience. War again a
time past brought stimulation of sex, the pathological expres
of which is seen in the increase in rape during the first six mo
of 1942 as compared with the same period of 1941, amountin
9.9 per 1,000 for cities over 25,000 in population, the lar
increase during the period in the various types of crime.

World War II noticeably extended the opportunities for wo
in industry. It added momentum to the American trend tov

uality of the sexes. The meaning of what was happening, the anges it would demand in American domestic traditions, would t appear until the war crisis ends.

As 1942 closed, there were two pressing problems that con- ned the American home. One was the difficulty of the hospi- s in caring for the ever increasing number of pregnant women l the inability of overdriven doctors in rural and village com- nities to give adequate maternal care. The other was lack of ficient and properly staffed resources to take care of young ldren whose mothers were working in war industry. Both blems were recognized and efforts were being made to meet m.

n the states that require a waiting period between applica- n for issuing of the licence and the issuing, this provision was ived for men in service on leave or the law is such as to per- one of the couple to fulfill the requirement. Judges in the owing states can waive the requirement: Connecticut, Georgia, ine, Massachusetts, Michigan, Minnesota, New Hampshire, io and Wisconsin, all of which have five-day waiting periods; gon, Pennsylvania, Tennessee, Washington and West Vir- ia, where the law requires a three-day lapse between applica- n and issue of the licence.

Legal Age of Marriage and Waiting Period Requirement in Each State as of 1942

statute, so common law rule seems to prevail. †With permission of court.
rces: *Martindale-Hubbell Law Directory*, vol. II; Chester G. Vernier, *American y Laws*, vol. I.

In Maryland either party can obtain the licence and then the wedding can take place immediately.

In New Jersey, where a three-day waiting period is required, one applicant may appear at the beginning of the waiting period and the second party may complete the application twenty-four hours before the wedding is to take place. The California law provides that one of the parties may apply for the licence, beginning the three-day lapse, but both parties must be present to receive the licence.

The five-day waiting period required in Mississippi for minors can be avoided provided the consent of the parents is given in writing. (*See* also CENSUS, 1940; LAW.) (E. R. G.)

Marshall, George Catlett

(1880–), U.S. army officer, was born at Uniontown, Pa., on Dec. 31. Commissioned second lieutenant of infantry Feb. 2, 1901, after completing his studies at Virginia Military institute and the Army Staff college, he advanced through the grades to brigadier general in 1936. In 1902 and 1903 he served in the Philippines, also from 1913 to 1916. He was with the American expeditionary forces in France in 1917, on the general staff of the first division, as chief of operations of the first army and as chief of staff of the eighth army corps. After the war he was aide-de-camp to Gen. John J. Pershing for five years. From 1924 to 1927 he was stationed in China; in 1933 he was appointed commander of the Eighth infantry and in 1936 commanding general of the Fifth brigade. On April 27, 1939, President Roosevelt appointed him chief of staff of the U.S. army with the rank of full general.

In 1941 he endorsed aid to Britain and early in the summer urged congress to extend the training period of conscripts and national guardsmen and to remove the ban on U.S. expeditionary forces outside the western hemisphere. On April 8, 1942, General Marshall and Harry Hopkins arrived in London to discuss United Nations war problems. Marshall shared Stimson's views on the necessity of having a large army, and he endorsed the program for a force of 7,500,000 men by 1943. On Oct. 14, 1942, he appeared before a senate committee pondering the draft of youths 18 and 19 years old and declared that young men made better soldiers than do men over 35. Replying to opponents of his plans for a large army, he appealed on Dec. 4 for confidence in army planning, declaring: "We know what we are doing."

Maryland.

A south Atlantic state, popularly called the "Old Line State," one of the original 13 states. Area 10,577 sq.mi. (land area 9,887 sq.mi.). Pop. (1940) 1,821,244. Total urban population 1,080,351, or 59.3%; rural population 740,893, or 40.7%; white 1,518,481, or 83.4%; nonwhite 302,763 (Negro 16.6%); foreign-born 81,715. Capital, Annapolis (13,069); other cities: Baltimore (859,100), Cumberland (39,483), Hagerstown (32,491), Frederick (15,802).

History.—The governor, re-elected in 1942 for a second term, was Herbert R. O'Conor; William C. Walsh was attorney-general; J. Millard Tawes, comptroller. Their terms expire Jan. 1947. The Maryland legislature did not meet in 1942. Governor O'Conor was re-elected by a narrow margin; the total vote cast was 333,136, as against 486,472 in 1938. Maryland Democrats lost two of the six house of representatives seats.

Seven constitutional amendments were voted on at the November election and four were carried. The most important were: (1) authority for the legislature to standardize fees for clerks of courts and registers of wills; (2) provision that the state roads commission condemn and immediately take property needed for highway purposes subject to subsequent court review; (3) provision for additional compensation for members of general assembly (increased pay from $5 per diem to $1,000 per year). The amendments voted down related to juvenile court jurisdiction, publication of proposed constitutional amendments and establishment of regulations for bequests to churches.

Education.—In 1941 there were 1,029 elementary and occupational schools (349 Negro) with an enrolment of 206,124 (48,968 Negro) and a teaching staff of 5,363 (1,246 Negro). There were 215 secondary and vocational schools (38 Negro) with an enrolment of 92,973 (12,644 Negro). Five teachers' colleges (two Negro) had an enrolment of 1,163 (340 Negro).

Public Welfare, Charities, Correction.—For the first 11 months of 1942 (figures in parentheses indicate number of persons per month and amount spent): general public assistance (6,318, $1,570,146.85), old-age assistance (16,455, $3,462,215.42), aid to needy blind (611, $152,178.59), aid to dependent children (9,097, $1,927,060.87), WPA employment (34,524, $2,640,693). For the 11-month period, 38,365 persons received unemployment compensation totalling $3,708,195.

In 1942 there was a house of correction, a penitentiary, state penal farm and women's prison, with total inmates of 3,000; state expenditures on correctional institutions amounted to $1,041,305.

Communication.—The state roads commission expended, during the fiscal year ending Sept. 30, 1942, a total of $24,306,650. This included financing of new construction, maintenance of state and county highway systems and financing of bonds. New projects completed represented a value of $4,515,000. Projects awarded amounted to $9,985,000. Total mileage maintained by state, 4,315 mi.; county road system, 11,082 mi. The outstanding projects constructed were access highways leading to war production plants southeast of Baltimore. There were 1,367 mi. of railroad in the state as of Dec. 1940; in 1942 there were 26 landing fields, 5 of them for seaplanes. There were 339,223 telephones in Jan. 1942.

Banking and Finance.—In 1942 there were 112 state banks and trust companies with deposits of $434,177,415 and resources of $485,699,616; 11 mutual savings banks with deposits of $225,643,949 and resources of $255,074,592; 63 national banks with deposits of $447,953,000 and resources of $482,211,000; and 422 (some inactive) savings and loan associations with deposits (1941) of $142,962,000. State receipts for the fiscal year ended Sept. 30, 1942, were $78,492,727; expenditures, $54,134,123; bonded indebtedness, $36,359,000; surplus, $10,348,597.

Agriculture.—Most of the state's principal crops, with the exception of wheat, showed increased production in 1942 as compared with the preceding year. Total value of production in 1942 was estimated at $69,448,000, as compared with $56,729,000 in 1941.

Table I.—*Leading Agricultural Products of Maryland, 1942 and 1941*

Crop	1942 (est.)	1941	Crop	1942 (est.)	1941
Corn, bu. . . .	17,290,000	15,164,000	Tame hay, tons .	560,000	472,000
Wheat, bu. . .	6,140,000	7,245,000	Tobacco, lb. . .	31,125,000	30,225,000

Manufacturing.—According to the U.S. biennial census of manufactures in 1939, the total estimated value of products $1,027,354,074; there were 141,643 wage earners, who were a total of $156,782,654. All manufacturing industries show 57.2% increase in combined payrolls and a 20% increas employment between Nov. 1941 and Nov. 1942.

Table II.—*Principal Industries of Maryland, 1939 and 1937*

Industry	Value of Products	
	1939	1937
Bread and baking	$22,245,899	$26,566,579
Canning (fruits, veg., soup)	27,302,603	30,881,579
Men's and boys' clothing	34,507,240	33,252,549
Meat packing	34,767,939	40,611,524
Shipbuilding	....	17,925,710
Tinware	35,836,828	37,040,006

Mineral Production.—In 1941 the principal minerals and production were as follows: coke 1,752,538 tons, coal 1,74 tons (estimated), sand and gravel 5,167,445 short tons, (value) $401,925.

(C. B.

Masonic Order.

Antiquity.—Work in the interesting of Masonic history continued and r appeared in the *A.Q.C. Transactions* vol. LIII, organ of the pi lodge of research, (*Quatuor Coronati* No. 2076, London), publ in two parts during the year. Part I carries a brief review Short History of Freemasonry, to 1730" by Douglas Knoop G. P. Jones, which the reviewer stated, "in less than 150 contains more about the history and development of the cra these (British) islands than any other of the same size tha come in my way." The same issue's leading article, on "Pur tient (archaic spelling) Masonry" is also by Mr. Knoop, wh Masonic scholar of standing, and was read by him befor above mentioned lodge of which he is one of the 40 members. theme was primarily the place of the Royal Arch Degree i early ritual; but in the course of his exhaustive discussi showed how certain regulations "were probably taken bodily a document dating from the third or fourth quarter of the century," how certain features of the ritual resembled the cedure adopted in the Middle Ages by various gilds," ho transition from "operative" to "speculative" Masonry occ earlier in Scotland and how a reference to Trinity college, D in 1688, was "the earliest reference to a Lodge of Freemaso Ireland." The same issue (pp. 147–188) contains another read before the lodge by R. J. Meekren, a Canadian Ma scholar, whose thesis is "that there were two primitive de . . . in the old Scottish lodges" instead of one, as held by preceding writers. His conclusion, which seemed to be shar his associates, was "that in essentials the Masonic ritual indefinite antiquity." Allen C. Austen, in the August *Ne* (505), finds that five foreign grand lodges contributed t foundation of Masonry in the United States, viz. the E Premier and English "Antient," Scottish, French (to Louis and Canadian (Michigan). His article is clarified by a cha which each American state grand lodge is traced to its sourc

Freemasonry and the War.—How the war affected the ish craft was illustrated by the meetings of most London l at "high noon" to avoid the blackout as well as the air despite which regular Masonic activity was maintained, ev those districts where bombing had been most destructive. meeting hour, however, prevented attendance of those in a service, military or civil, and resulted in recalling leader lodge officers who had retired and who, incidentally, brought Masonic jewels and regalia to meet the shortage caused by tations on manufacture.

Membership of the 49 American grand lodges was report 1942 as 2,453,175 apportioned among 15,329 lodges. This does not include the Philippines, from which, as from European countries, Masonic statistics were unobtainable. Canadian lodges, numbering 1376, reported 165,226 membe

Bibliography.—Lobingier, *History of the (Mother) Supreme* C (1931); Lobingier, *The Ancient and Accepted Scottish Rite* (1932); "Why Hitler Hates and Fears Freemasonry," *New Age* (Aug. to 1942).

(C. S.

Massachusetts.

A north Atlantic state of the U.S. mitted to the union Feb. 6, 1788.

93 sq.mi., including 254 sq.mi. of inland water; pop. (1940) 16,721, of which 3,859,476 was urban, 457,245 rural; 4,257,- white, 55,391 Negro. Capital, Boston (770,816). Other prin- al cities: Worcester (193,694); Springfield (149,554); Fall ver (115,428); Cambridge (110,879); New Bedford (110,341); nerville (102,177); and Lowell (101,389).

History.—Governor Leverett Saltonstall was inaugurated Jan. 1943, for his third two-year term following his election two nths previously, in which the Republican party again won most the elective offices of the state. Officers of the state in 1942 luded: lieutenant governor, Horace T. Cahill (Rep.); secretary state, Frederick W. Cook (Rep.); treasurer and receiver gen- l, Francis X. Hurley (Dem.); auditor, Thomas J. Buckley em.); attorney general, Robert T. Bushnell (Rep).

here was no regular legislative session in 1942, an off-year er the biennial plan. In Jan. 1942 Governor Saltonstall pro- med a state of emergency and assumed the full powers pro- ed by law, this action being ratified and continued by a special ion of the legislature called the same month.

he net state assessment on municipalities for 1941–42 was lowest since World War I, with the exception of 1931–32. ing the four years of the Saltonstall administration, this ual state tax was reduced from $12,000,000 to $5,000,000. net direct debt of the state government was cut from about ,700,000 in 1938 to $11,595,278 on Nov. 30, 1942.

Iassachusetts was the first state in the union to begin active lian defense preparations through establishment of a State nmittee on Public Safety. Closely related to the work of this nmittee was the state plan put in operation by Gov. Salton- l for handling any emergency through co-operation of all tary and non-military state agencies.

hrough the Military Information centre in the state house, Disaster Relief commission was on a 24-hour-a-day basis in 2.

ducation.—In 1942, Massachusetts maintained 1,887 ele- tary school buildings, with 367,435 pupils and 13,974 teach- 169 junior high school buildings, with 97,591 pupils and 4 teachers; 271 senior high school buildings, with 115,368 ils and 6,938 teachers. The 10 state teachers colleges had a bined enrolment of 2,203; there were 316 teachers. The state ege is at Amherst.

ublic Welfare, Charities, Correction.—State and municipal are aid, as of Dec. 1, 1942, reached an average of 226,360 s with approximate 12-months expenditure of $64,636,197. es of assistance were: old age, $33,425,468; aid to blind ,807; unemployment compensation, $11,722,785; general re- $8,764,331; aid to dependent children, $8,181,050; child dianship, $2,213,756. The average number of WPA employees 1942 was 24,822, representing a drop from 35,915 in January 3,140 in December.

he five state correctional institutions in 1942 included a state on, state prison colony, reformatory for men, reformatory for nen, and a state farm including accommodations for the ne. Average number of inmates in 1942 was 5,309.

ommunications.—Total mileage of highways in 1942 was 16, of which 17,439 mi. were rural. State highway expendi- s in 1941 totalled $14,316,000, construction, maintenance and inistration absorbing $10,435,000. Railroad mileage in oper- n in 1942 was 3,883. Mileage of regular public air lines in state in 1941 was 330, number of commercial airports, 44. phones in use in Sept. 1942, totalled 1,018,323.

anking and Finance.—There were 911 state banking institu- s in 1942, including 191 savings banks, 181 co-operative banks, rust companies, and 470 credit unions. The number of na- al banks was 124. Total banking deposits were $5,216,255,000; total banking assets, $7,081,059,000. The resources of the 26 federal savings and loan associations were $132,579,325.

In the year ending Nov. 30, 1942, the state government receipts were $132,624,093, including $1,500,000 from the sale of Commonwealth Airport bonds. State government expenditures for this period were $125,411,797, state debt (gross direct) $13,042,363, (net direct) $11,595,278.

Agriculture.—Gross income of agricultural production in 1941 was $100,959,000, of which $42,478,000 was from crops and $58,481,000 from livestock. Cash income from crops in 1941 was $38,661,000, from livestock $54,928,000. Fish landed in Boston in 1942 amounted to 195,550,268 lb. valued at $12,631,975; Gloucester, 161,259,228 lb.; New Bedford, 54,413,973 lb.

Principal Agricultural Products of Massachusetts, 1942 and 1941

Crop	1942 (est.)	1941
Tobacco, lb.	9,065,000	9,781,000
Cranberries, bbl.	525,000	500,000
Apples, commercial, bu.	3,400,000	2,488,000
Potatoes, bu.	2,850,000	2,492,000
Asparagus, crates	158,000	144,000
Onions, bags	338,000	411,000
Hay, all, tons	582,000	470,000
Corn, grain, bu.	308,000	287,000
Corn, silage, tons	308,000	294,000

Mineral Production.—A mica mine was reopened at Chester State Forest, after many years. The production of principal minerals in 1941, in short tons, was: coke and byproducts, 1,161,732; lime, 106,336; stone, 2,602,120; sand and gravel used, 5,351,002. (L. Sl.)

Massachusetts Institute of Technology.

During 1942 all of the effort, planning and policies at the Massachusetts Institute of Technology were shaped and directed by the needs of the war effort. Fifty-five members of the faculty were given leaves to accept war assignments in many different fields, while 160 were engaged in full or part-time war work at the institute.

Under the auspices of the United States office of education, 52 courses extending over periods varying from 4 to 16 weeks were given by the institute to more than 2,000 students. In addition to these courses, other special students from the army, navy, and weather bureau, were given training in other special courses.

The most important of the institute's activities in the war effort was its research program. More than 90 separate contracts for research and development were in force in 1942. Of these contracts more than one-half were with government agencies and the rest with industrial firms. In order to undertake this additional work about 1,800, half scientific and half accessory, personnel were added to the staff, many of whom were on leave from some 70 educational institutions and 40 industrial organizations.

The institute's normal operating budget, excluding the special war program, for the year 1941–42 totalled $3,710,000; gifts received totalled $926,900; educational plant assets stood at $17,054,000, an increase of $330,000; and the book value of endowment funds totalled $37,266,300, an increase of $1,285,000 during the year.

Enrolment for the academic year 1942–43 totalled 3,048, of which 596 were graduate students. Seventy per cent came from outside Massachusetts, 62% from outside the New England states, 32% from outside the North Atlantic states and 6% from outside the United States. (K. T. C.)

Mathematics.

Mathematical research, judged by the number of pages published in the journals, fell in 1942 to one-half of its pre-war volume. The disruption of communications and the suppression of information about the large amount of mathematical research being done on war problems rendered a complete report for 1942 impossible. Nevertheless, new results were known to have been obtained in all fields. For example, it was shown that every sufficiently large integer can be expressed as the sum of not more than 23 fifth powers of integers, and also as the sum of not more than 36 sixth powers of integers. New results in combinatory logic included an important new consistency proof. The Euclidean algorithm for finding the highest common factor of two or more numbers was extended to a similar algorithm for vectors. These were important new developments in the theory of groups whose elements form a lattice. Further progress was made on the problem of Geöcze, which is concerned with the equivalence of two definitions of the area of a surface. The class of functions for which the Fourier-Bessel expansion is known to be valid was considerably enlarged. Other new results were obtained in the study of relaxation oscillations, statistics, the theory of elasticity, hydrodynamics, aerodynamics and the buckling of thin plates.

Professor G. D. Birkhoff of Harvard served as exchange professor with Latin American universities; he lectured in the universities at Mexico City, Lima, Arequipa and Santiago. Professor P. R. Rider of Washington university began a term as exchange professor at the National University of Mexico, lecturing on mathematical statistics. Dean Godofredo García of the National University of San Marcos established the fundamental equality of Sundman for the case of n bodies and extended the celebrated inequality of Sundman to the general case of n bodies and even to a gravitational gas such as a cloud or gaseous nebula. I. M. Vinogradov of Moscow was elected a foreign member of the Royal Society of London. The mathematical world joined in celebrating the tercentenaries of the birth of Isaac Newton (1642–1727), of the invention of the first calculating machine by Blaise Pascal, and of the death of Galileo Galilei (1564–1642). The William Lowell Putnam Mathematical competition, won in 1942 for the third time in five years by the University of Toronto, was not to be held in 1943 because of the war.

Records compiled showed that about 130 mathematicians came to North America from Europe during the years 1933–42, and that 100 doctorates with mathematics or mathematical physics as the major subject were conferred during 1941 in the United States and Canada. War, with new demands for research and for the instruction of those about to enter the armed forces and industry, caused an acute shortage of mathematicians in America. Much energy was directed into the study of applied mathematics; Brown University announced that it would begin publication of *Journal of Applied Mathematics* early in 1943. Graduate work in pure mathematics was rapidly approaching the vanishing point. America merely repeated the experience of England. At Cambridge university the number of lecturers was reduced by about half, the undergraduate population was much smaller, and there were only two or three men research students in residence. The belief was expressed, however, that enough new mathematics appeared to keep alive every branch of the subject.

The November 1942 number of *Mathematical Reviews* contained no reviews of papers published in axis countries in 1942; this fact undoubtedly resulted from the disruption of communications rather than the cessation of mathematical research. New publications included Whyburn's *Analytic Topology,* Lefschetz's *Algebraic Topology,* Jackson's *Fourier Series and Orthogonal Polynomials,* Coxeter's *Non-Euclidean Geometry, Mathematical Monographs* (*Northwestern University Studies in Mathematics and the Physical Sciences,* vol. 1), and *University of California Publications in Mathematics* (Los Angeles, vol. 1).

Matheson, Samuel Pritchard (1852–1942), Cana clergyman, was Sept. 20 in Manitoba, Canada. He received his B.D. in 188 St. John's college and later served there as headmaster and fessor. He was ordained deacon in 1875, made canon of John's cathedral, 1882, and archbishop of Rupert's Land, 19 31. From 1909 until his retirement in 1931, he was primat the Church of England in Canada. He also served as chairma the advisory board of education for Manitoba and chancello the University of Manitoba. He died in Winnipeg, May 19.

Meat. Although production of meat (beef, pork, mutton veal) in 1942 in the United States broke all rec and reached an astounding figure estimated at 22,000,000,000 rationing through restricted deliveries to retailers was put effect in the autumn, and by mid-winter acute shortages developed in areas on the east and west coasts. The 1942 duction was 29% greater than the five-year (1936–40) ave and 86% of that increase went into lend-lease channels and the military forces. A goal of 25,700,000,000 lb. of red meat set for 1943, 50% more than the average annual productio the 1936–40 period.

Supplies of pork for civilian consumption in 1943, to dietary standards were estimated at slightly under 8,800,000 lb., or 69 lb. per capita for the year, compared to a per ca consumption of 66.6 lb. in 1941 and a five-year average of lb. Military and lend-lease requirements of pork in 1943 w

"MARY HAD A *LITTLE* LAMB." The U.S. meat shortage of 1942 reduc nursery terms by Alexander of the *Philadelphia Evening Bulletin*

Livestock Slaughter in Plants under Federal Inspection, 1942 and 1941

	1942 numbers	1941 numbers
attle	12,347,369	10,945,906
ogs	53,896,881	46,519,757
eep	21,624,689	18,124,531

was estimated, exceed those of 1942 by more than 1,500,000,- lb. Allowances of beef and veal for civilian consumption in 43 were scaled slightly below the consumption of 1941 and out 550,000,000 lb. below the 1942 consumption. Civilian re- rements for lamb and mutton in 1943 were placed at a mini- m of 888,000,000 lb., more than the five-year average, but htly less than consumption in 1941 or 1942.

Cold storage holdings of meat Jan. 1, 1943, were reported as 557,000 lb. compared to 716,597,000 lb. a year previously. k supplies in storage were 488,333,000 lb.; beef 129,019,000 lamb and mutton, 35,058,000 lb. These figures had little nificance for civilian consumers, as most of the holdings were ernment owned or earmarked for lend-lease, army or navy tinations. The OPA quota system, imposed in the autumn of 2, was further applied beginning with 1943, it was announced, packers were required to limit deliveries to civilian consumers he first three months of 1943 to percentages based on deliv- s to civilian consumers in the first quarter of 1941; namely, % of beef, pork and veal; 75% of lamb and mutton. Farmers e not restricted to slaughter of meat animals for their own but had to maintain sales to customers at the same volume as 2. dical Research, Committee on: *see* Scientific Re- rch and Development, Office of.

dicine. A nation at war intensifies its research, particularly research in the field of medicine because the lth of both the armed forces and the civilian population is ntial to the winning of the war. During 1942 sickness and h rates in the United States reached the lowest point in his- and birth rates increased.

hemotherapy.—Outstanding among chemotherapeutic in- igations was the development of dicoumarin, a substance de- d from rotted sweet clover, which acts similar to heparin in enting the clotting of blood.

ulphadiazine was established as the most useful of the sulpha s because of its absorbability, effectiveness and lessened tox- . For the dysenteries, sulphaguanidine was proved to be t useful. New drugs under investigation included sulphaceta- e and sulphasuxidine.

echolyl bromide was found to be a drug definitely affecting parasympathetic nervous system of the human body and efore useful in controlling vasospastic conditions.

xperiments continued with penicillin, a mould, and gramicidin tyrothricin as antiseptic substances of tremendous potency, far, however, not available commercially.

uch experimentation was made on a new narcotic called erol, known in Europe as dolantin. Investigation indicated to be a powerful and quick-acting narcotic, although there e still some questions as to its addictive properties; the claim made, but not fully substantiated, that this product is less t-forming than morphine.

utstanding in chemotherapy was the development of the man- ture in the United States of substitutes for quinine, which shut off by the Japanese capture of the Netherlands East Indies. Atabrine was made in quantities in the United States, production reaching 1,000,000,000 tablets per year. The product, tested under controlled conditions in the armed forces, was found to perform successfully, although it is a dye substance and induces a somewhat yellow colour of the skin when used continuously. Totaquina was made official in the U.S. Pharmacopeia. It is a mixture of all of the alkaloids from the cinchona bark. The cinchona bark from South America, particularly Bolivia, is less rich in quinine than that from the Netherlands Indies. Plasmochin, another antimalarial, was also manufactured for the first time in quantities in the United States.

A derivative of nicotinic acid, nikethamide, was found to be useful as a stimulant of the central nervous system.

A portion of the vitamin B complex called para-aminobenzoic acid has the property of opposing the effectiveness of the sulphonamides. Modifications of the sulphonamides were prepared for use directly applied to the sinuses in cases of chronic infection.

The sulpha drugs were shown to be relatively less useful with most virus diseases than with other infections. They seemed to be without specific effect in measles or in atypical virus pneumonia. In meningitis the sulphonamides were found to be more specific and useful than antimeningococcic serum, although in difficult cases both methods are used. Promin, another sulphanilamide product, was tested in tuberculosis and was found useful in experimental infections in animals. Thus far as used in human beings it appears to be too toxic for safety.

A late development was the mixing of 3% sulphadiazine or 3% sulphanilamide with 2.5% methyl cellulose, which is a plastic, 3% triethanolamine and 0.5% sorbitol with 50% alcohol or acetone. This makes a fluid which can be spread on a smooth glass surface and then allowed to dry. The result is a material which looks like wax paper and which can be placed on wounds or serious burns, protecting them and at the same time supplying the effect of the sulphonamide drug against infection. (*See* also Chemotherapy.)

Vitamins.—Tuberculosis, it was shown, places special demands on the body for vitamin A, so that increased amounts of vitamin A are needed by those who have this disease. Altogether, some 28 different vitamins were recognized, of which at least ten are portions of the vitamin B complex.

Isolation of biotin in pure form permitted experimentation which showed the necessity of this portion of the vitamin B complex in nutrition.

Avidin, a concentrate of dried egg white, has the power to destroy biotin in the human body. Since cancer cells require biotin for growth, the suggestion was made that large amounts of avidin would control cancers in human beings. Experimentation with mice of a cancer strain and with human beings failed to reveal any specific effect determinable for avidin used in this way.

Extra vitamin B complex is required by people doing heavy muscular work and by those with excessive action of the thyroid gland. Vitamin B deficiency in such cases is associated with easy fatigue and loss of efficiency in daily work.

New studies showed that riboflavin (vitamin B_2) may be associated with vision and that dimness of vision is related to a shortage.

The germ of undulant fever, called brucella, requires biotin in order to grow satisfactorily.

An investigation of fatigue in the Physiology department of Northwestern University Medical school showed that none of the individual parts of the vitamin B complex as a whole has any immediate influence on recovery from voluntary muscular fatigue in people who are receiving adequate diets.

There is a definite relation between thiamin and the manner in

hich the body uses sugar for muscular activity. A chronic de- ciency of thiamin produced signs of heart failure in pigeons d in pigs due to a decrease in the heart muscle content of gars.

A shortage of vitamin C occasioned by the war caused Great ritain to seek new sources for this vitamin. Blackberries, black rrants and rose hips were found to be especially rich in vita- in C.

Oranges grown in the sun were shown to have more vitamin C an those grown in the shade. Pink grapefruit has more vita- in C than yellow. Grapefruit on the outside branches of the tree s more vitamin C than that on the inside.

Continuing studies indicated that no one of the vitamins is ecific for graying of the hair but that this is a complex process which shortages of various substances may have a relation. *ee* also Vitamins.)

Glands.—Investigators showed that damage to the pituitary and results in loss of weight, and damage to the hypothalamus the brain results in gain of weight. The injection of anterior uitary hormone in large amounts results in a destruction of the ands of Langerhans in the pancreas, these being the structures ich produce insulin. Thus, diabetes may be produced by extra ounts of anterior pituitary hormone.

Extraordinary effects were observed by the use of stilboestrol d follutein, female sex hormones, in enlargement of the pros- e in man. Instances were reported in which large amounts of ese hormones resulted in a stopping of such enlargement. More- er, the use of these glandular materials was found to have a finite effect in controlling the growth of cancer of the prostate nd in man. Investigators also reported that removal of the le testicles of the male sex glands had an effect in stopping pain of cancer of the prostate, and in some instances, in par- l or apparently complete disappearance of such forms of cancer.

Infections and Viruses.—After World War I, new methods re developed for the isolation of viruses capable of carrying ection. Thus far the viruses of special importance were those ated to epidemic keratoconjunctivitis (*see* Eye, Diseases of) d atypical virus pneumonia.

Epidemic keratoconjunctivitis is an inflammation of the eyes used by a virus. This spread apparently from the far east to waii, then to the Pacific coast and then across the United tes. It affected principally workers in industry. The symp- ns include reddening, swelling and congestion of the white por- n of the eye with subsequent scarring. Workers are disabled five or six weeks by inability to stand light and constant flow tears. The condition was not susceptible to treatment with sulphonamide drugs. Most cases were cured completely with passing of time. Dr. Murray Sanders isolated a virus appar- ly responsible for this condition and prepared a vaccine which ld be used as a means of prevention and treatment. This us, as many others, was grown on the foetal chick embryo.

With the coming of cold weather, troops in many camps and ilians as well began to become ill with an unusual form of eumonia which could be detected by early use of the X-ray which was differentiated from ordinary pneumonia by fail- to find the pneumonia germs in the sputum. The condition s called atypical virus pneumonia or acute pneumonitis. The dition was not as serious as ordinary pneumonia and the mber of deaths was slight. This virus also failed to be con- lled by the sulphonamide drugs. Studies made by one group of estigators showed that a similar virus is found in cats and in s; furthermore, it was shown that the virus may pass not only m cats to human beings but from human beings to cats. Vari- s pneumonias are spread also by viruses of the type that cause ttacosis in parrots and birds. Several viruses apparently pass from bird to man and from man to bird. This condition was called ornithosis.

Other virus diseases were reported affecting the nervous system including various forms of epidemic inflammation of the brain or encephalitis; also such conditions as typhus fever, which is spread by a virus.

A special commission to study typhus was established by the army, navy and public health service and left in Dec. 1942 for the far east to control the disease there and in north Africa.

Vaccines were developed against the virus of typhus fever by growing the virus on the foetal chick embryo. The entire Iranian army was inoculated with such a vaccine by Dr. A. Neuwirth.

Outbreaks occurred in various portions of the U.S. in hospital nurseries producing epidemic diarrhoeas among newborn babies, in some instances related to the usual germs of dysentery, in others to unknown viruses.

Surgery.—The results of modern surgery were vastly improved by the development of new devices and techniques and by the application to surgery of new discoveries in other fields. Thus the giving of blood plasma previously and subsequent to operation helps to avoid shock and the bad effects of haemorrhage. A wide variety of anaesthetics makes possible lessening of risk from anaesthesia. The use of sulphonamide drugs pre- and postoperatively controls infection.

New methods included the development of an electromagnetic device for determining the exact spots in which bullets or other metallic fragments lie in the body. An automatic sewing device made easier the technique of stitching and also shortened the time required for repair after operation.

The tendency was more and more to treat wounds with plenty of soap and water rather than with antiseptics. In one large industry more than 12,000 wounds were treated exclusively with soap and water. In no instance was it necessary to put a worker in the hospital because of infection of the wound.

A new splinting device was developed by a veterinarian named Stader. It involves the insertion of pins into the fragments of bone and the interlocking of these pins with an adjustable splinting device. With this device persons whose bones had been fractured could walk or use the arms within one or two days after the fracture occurred.

In removal of the prostate gland, transurethral resection with electric coagulation by a heated knife introduced through a cystoscope became established as the optimum procedure in most cases.

The sewing of a torn or broken nerve is about as delicate a task as is known to medicine. In World War I doctors used linen and silk thread and also human hair for this purpose. British investigators introduced a new method which consists of a form of fibrin from clotted blood and which is dropped between the torn ends of the nerve. The nerve is then drawn together with fine silk.

Russians introduced sawdust in sacks of thin gauze in place of wool and cotton in dressing war wounds.

Russians also claimed to have grafted nerves from corpses to living persons. Wounds were treated by covering them with peritoneum—the thin tissue which lines the abdominal cavity.

Refrigeration was used to anaesthetize limbs that had to be amputated in the case of a patient with diabetic gangrene since such persons cannot take the ordinary anaesthetics. The limb is packed thoroughly in ice and covered with a rubber blanket. Salt is added to the ice to maintain the low temperature. Before application of the tourniquet, ice bags are applied for 30 minutes to shut off all pain of applying a tourniquet. After the leg is in ice for two and one-half hours, it is without sensation of pain.

Especially serious among war injuries is the effect of blast.

Sailors thrown into the water and swimming on the surface suddenly become unconscious and some of them die when depth charges explode in the sinking ship. Most post-mortems showed the intestines torn in many places. Navy investigators developed information regarding the mechanism of this injury and devised a special jacket to be associated with the life preserver which serves to interfere with pressures that cause blast injury.

In operating rooms the use of ultra-violet rays was efficient in freeing the atmosphere of infectious organisms. Sprays of propylene glycol, harmless antiseptic, were also found efficient in controlling germs in the air.

Operations were done on hearts of persons with angina pectoris resulting from insufficient circulation of blood to the heart muscle by opening the sac containing the heart and putting in a small amount of talcum powder. This caused adhesions and the development of a new blood supply. Drs. S. A. Thompson and Milton J. Raesbeck did this operation on 19 people of whom 4 died and 15 recovered with improvement. (*See* also SURGERY.)

Obstetrics.—Especially notable in 1942 was the development of a technique leading toward a method for safe painless childbirth. This method, developed by Hingson and Edwards, is an extension of a method used in surgery involving the injection of an anaesthetic into the caudal area or lowermost portion of the spinal column. A needle is passed into the area around the membranes which cover the end of the spinal cord. From this area emerge the nerve roots which control the sensations to the uterus and the genital area along which the child passes in the process of childbirth.

A device was projected for continuing such injection of an anaesthetic over long periods of time, in some instances as long as 28 hours. In hundreds of cases the method seems to have been successful in producing complete insensibility to pain, yet without any loss of consciousness and without postpartum nausea, vomiting or other unfavourable symptoms. The drug used was a product called metycaine, which is dissolved in a physiologic salt solution.

In 25 cases treated by this method in the Chicago Lying-in hospital, obstetricians reported complete success in 85%, partial success in 15%.

The method was in an early experimental stage and subject to considerable improvement both in the materials used and in the technique. (*See* also GYNAECOLOGY AND OBSTETRICS.)

Cancer.—Cyclotrons were improved to provide 3,000,000 volts and the General Electric company was reported to be building a cyclotron that would produce 200,000,000 volts. Cancers treated with neutron produced by the cyclotron showed improvement in three months. In 20% of instances, however, the tumours were not affected. Neutron particles are thought to be more destructive of cancer tissue than equivalent amounts of the X-ray. (*See* also CANCER.)

Nutrition.—Restrictions on the diet in warring countries produced conditions which caused scientists serious concern. People in England were found to be suffering with increased amounts of anaemia due to wartime diets. Tuberculosis increased in practically all of the warring nations—this increase was believed to be associated both with overcrowding and with dietary deficiencies. Most serious were the deficiencies of protein known to be just as necessary as vitamins for health and growth. Biochemists were studying the individual amino acids which make up protein. Means were developed for injecting such amino acids directly into the blood in serious cases of protein deficiency. Special studies were made of the trace elements in the diet, including manganese, zinc, boron, cobalt and other minerals. It was known that small amounts of such minerals play an important part in metabolism.

Statisticians for the Metropolitan Life Insurance comp stated that a wartime lessening of food might prove a bless in disguise to American women by aiding their programs of we reduction. Stout people are more likely to develop chronic ease at an earlier age than are those who are underweight. Wo who are overweight are particularly susceptible to diabetes, eases of the gall bladder, and some forms of arthritis.

People who are looking for pep pills and vitamins need believe that any vitamin or group of vitamins can produce en when it is lost by exhaustion and fatigue.

Diabetes tends to disappear from racial stocks due to a reces trend. The tendency of the disease is to appear at a younger younger age but less and less in the descendants of diabetic ents.

Aeroplane watchers were found frequently to be suffering f deficiencies of vitamin A in the diet which produced night bl ness. They were placed on diets containing enough vitami and in order to adapt themselves to seeing in the dark were quired to wear dark goggles for at least 45 minutes before un taking their work.

Investigators showed that canned foods maintain their vita content better than raw fruits and vegetables, which lose v mins when held in storage.

Peanuts were found to lose from 70% to 80% of thiamin vitamin B_1) when processed in hot oil or roasted.

It was established that the presence of any alkaline substa in cooking will destroy at least 50% of the thiamin conten food.

From lemon peel, Szent-Györgyi isolated another vitamin ca citron, or vitamin P, which is said to have a definite relation to the capillaries or smallest blood vessels. (*See* also DIETETI

Venereal Disease.—Studies by R. A. Vonderlehr and Lid Usilton of the United States public health service made 2,093,000 selectees and volunteers indicated positive or doub blood tests for syphilis among 45.3 per 1,000. Calculating on the rate of prevalence for the entire male population of United States between the ages of 21 and 35 years would gi rate of 47.7 per 1,000. The rate of prevalence among Negro lectees was 252.3 per 1,000. Among the white selectees it 17.4 per 1,000. This would give a rate for the entire male N population between the ages of 21 to 35 of 27.2 for each people, and for the white population of 2.35 for each 100 pe The rate for rural areas was 4.38 per 100 as contrasted with for the cities. The highest rates were found in the southeas states; the lowest in New England, western, north central middle Atlantic states.

During 1942 continued attention was given to intensive met of treatment of syphilis, including the five-day treatment, a week treatment, and a new one-day intensive method. In a these methods injections of arsenical drugs are made directly the blood stream. In addition the injection of the drug is cont ous in the one-day treatment and the patient is submitted ing the course of the treatment to seven hours of continued ing to bring the temperature of the body up to 106°. All of intensive methods of treatment were considered to be in an e experimental stage since syphilis is known to be a disease of duration, with the organisms hiding themselves away dee various portions of the body and with the manifestation app ing sometimes after 5 to 25 years. Thus these manifestations not show themselves for some time following the initial treatm and the change of the blood test from positive to negative.

Especially significant was the development of a rapid me for the cure of gonorrhoea so that in many army camps by combination of the use of the sulpha drugs internally and he of the body with hyperthermic devices patients were cure orrhoea in one or two days. For control the army tended to such boys under hospital conditions for from five to ten s in all.

s a means of controlling the dissemination of venereal dis- the government recognized that these are infectious diseases. els, which were cited by members of the armed forces as es in which they were infected, were placarded and quaran- d in many cities. Many concentration camps were established ospitals in which professional or clandestine prostitutes were ited by compulsion and given various methods of treatment. also Venereal Diseases.)

nusual Observations.—In Yale University Medical school A. V. N. Goodyer and associates recorded the heart beats of embryo in the fourth month by using an amplifier connected the electrocardiographic apparatus.

orking with Drosophila, the fruit fly, Gowen discovered that predetermination of sex is a function of the genes in the egg In *Science,* Dec. 18, 1942, he made the claim that the means predetermination of the sex through specific agencies under 's guidance were established.

uring 1942 the fattest person known to medical science died. was Mrs. Ruth G. Pontico of Tampa, Fla., 5 ft. 5½ in. tall, weighed 772½ lb. The heaviest person (but not the fattest) ever lived was Miles Darden who died in 1857 in Henderson ty, Tenn. He was 7½ ft. tall and weighed a little over 1,000 lb.

o settle an argument Dr. Paul Dudley White circulated a tionnaire among long-distance and marathon runners. He d that the heart beat does tend to be smaller in marathon long-distance runners. Four of the most widely known cham- s in this field had pulse rates at rest of 38, 37, 38 and 35 per minute respectively. Les MacMitchell, champion two- , had a normal pulse rate of 32.

hen the blood pressure is recorded in an ordinary bedroom ad of a doctor's office it tends to measure 10 to 15 mm. of ury less.

actically no animals, except human beings and pet dogs, r from constipation.

perience with chiggers, fleas, ticks and other insects in World II activities produced shortages of pyrethrum, a rotenone il as a repellent of insects.

octors Wolf and Wolff studied a man, 56 years old, who had fed since youth through an opening made into his stomach. found that anger produces congestion of the wall of the ach, spasms and sometimes little haemorrhages which may t in ulcers.

cteriologists have classified 33 different types of pneumonia with special antiserums, made from rabbit blood, against of them.

patient was maintained for 17 days by injecting food directly his veins, including protein from casein digest, fat from olive nd sugar in the form of dextrose.

baby chicken can be caused to exhibit the behaviour of a er hen by injecting it with prolactin, a glandular substance ed from the pituitary gland.

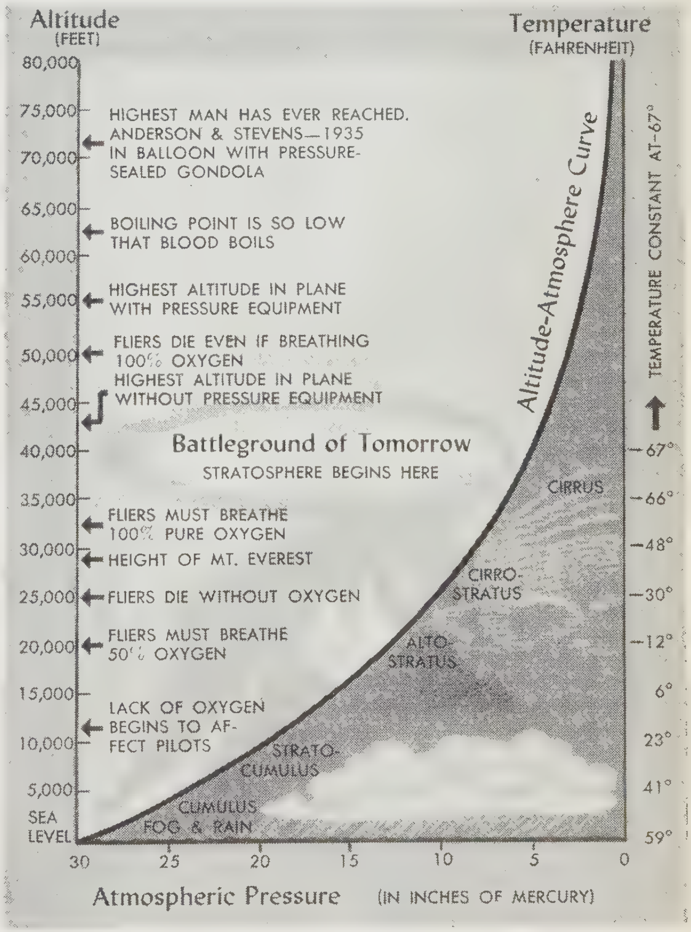
omen are less fit than men for both moderate and strenuous ion. Studies made in the laboratories of Wellesley and Har- showed that the eight best women equalled the performances e poor men, "proving" that women are the "weaker sex."

oise is detrimental to health and hearing. The sounds of an ge office reach 40 decibels, ordinary street traffic 80 decibels, p boiler 90 decibels, and an aeroplane motor 110 decibels.

ar Medicine.—From the Solomon Islands came the report mortality from wounds of all types had been less than 1% ntrasted with a mortality for wounds of all types for World I of 7%. The figure of one-half of 1% compares with the figure of 1.5% for the Russian army in World War II. These results were achieved by the administration of blood plasma in the field to all seriously wounded men, the injection of a narcotic, the sprinkling of sulphanilamide or sulphadiazine on the wound, and the administration of sulphadiazine or sulphathiazole internally. The wounded man was then conveyed to the rear where he was placed in an aeroplane ambulance (carrying 12 stretcher patients or 25 ambulatory cases) and flown to a base hospital in some far removed place where he received the best that modern scientific medicine could offer under good hospital conditions. The initial mortality among those engaged was high, however, because of the deadliness of modern methods of destruction.

Outstanding in war medicine was the use of blood plasma, for which 2,000,000 people contributed blood in 1942; the use of human blood proteins; the use of the sulpha drugs internally and externally; the inoculation of troops against yellow fever, cholera, plague, typhus, tetanus and other infections and the development and use of atabrine as a substitute for quinine in the prevention of malaria. Contributing also to the effectiveness of troops were the application of modern information regarding nutrition, new studies of fatigue and tremendous advances made in aviation medicine. Whereas aeroplanes went to heights of 7,000 to 10,000 ft. in World War I, bombers in World War II went in at 30,000 to 45,000 ft. altitude. This required special materials for oxygenation, warmth and other controlled conditions.

Special problems of World War II were the high incidence of gastric ulcer as a cause of disability, the large number of rejections for nervous and mental conditions, and the breakdown of considerable numbers of men actually in the service from nervous



EFFECTS OF DIFFERENT ALTITUDES on fliers. As the climbing ranges of fighters and bombers increased in 1942, scientists in all belligerent countries intensified their researches into the effects of cold and low atmospheric pressure on men and machines and mental conditions.

The most serious cause of disability thus far in the armed forces in the United States was the epidemic of hepatitis with jaundice which affected somewhere between 60,000 to 75,000 men and caused something less than 100 deaths. Current belief was that the jaundice was due to a virus carried by the blood of some of the donors who provided serum which was mixed with the vaccine to maintain its potency.

A striking observation in World War II was the preponderance of head injuries by blunt objects over those of penetrating missiles. This was believed to be due to the increase in aerial warfare.

At Pearl Harbor burns constituted 60% of injuries to the sailors. Such burns were treated with sprays of the sulphonamide drugs with excellent results.

Parachute jumpers were studied in jumps ranging from 8,400 to 29,300 ft. In falling from maximum heights the body reaches a velocity of 171 m.p.h. In fact during the period just before the parachute is opened the body may reach a velocity of 229 m.p.h. The mental reactions during this period are clear and rapid in the person who is calm and unfrightened. The blood pressure is not influenced, the respiration is irregular, the ability to hear is disturbed, and there may be nausea and faintness if the body is spinning or tumbling.

Selective Service Administration.—During 1942 the medical examinations under Selective Service were changed to include a coarse screening only by the Selective Service boards with a detailed examination made by the physicians associated with the army and navy induction and enlistment boards. The standards for service, both full and limited, were greatly modified. Men were no longer rejected because of deficiencies related to the teeth unless seriously infected but were inducted into the army or navy where suitable dental care was supplied. Arrangements were made for induction for limited service of the draftee, depending on the physical disability. The medical department of the Selective Service system developed means for improving physical fitness of boys and girls in schools and for prehabilitation and rehabilitation. Pilot tests conducted in Maryland and Virginia indicated the desirability of as much medical rehabilitation as possible but relatively little desirability for surgical rehabilitation, including operations on ruptures, flat feet, spinal curvature, or similar disabilities.

Socialization of Medicine.—During 1942 the United States public health service and the bureau of maternal and infant welfare in the department of labour were greatly expanded to meet the needs of the war. Liaison officers were created to handle problems of health between army camps and civilian communities. Special efforts were required for the control of venereal disease. Arrangements were made to expend funds derived under the Social Security taxes for the care of mothers in childbirth, particularly the wives of men in the armed forces. Obstetrical departments and nurseries were established in many large army hospitals. Congress provided a largely increased appropriation for the venereal disease control campaign.

Medical service plans continued to develop so that by the close of 1942, 16 states developed through their state medical societies mutual plans for extending medical services to large numbers of workers in industry. The outstanding plans were those of the Michigan State Medical society and of the California State Medical society. Plans were also developed and became effective in Massachusetts and New Jersey. The Farm Security administration developed a medical service plan with 793 units in 40 states, covering 1,017 counties and having a membership of 109,964 families, including 578,804 persons.

Another plan developed in California was the Agricultural Workers Health and Medical association which provided m care for an additional 600,000 persons. The Michigan M Service plan had enrolled 455,000 people including more 160,000 employees of General Motors corporation.

In the U.S. as a whole, more than 15,000,000 people volum insured themselves against the costs of hospitalization in v mutual and private insurance plans.

The Supply of Physicians.—At the end of 1942 more 40,000 physicians of the 186,000 physicians licensed to pr medicine in the United States had been enrolled in the a forces.

The Procurement and Assignment Service for Physicians, tists and Veterinarians, established as a part of the Offi Defense Health and Welfare Services, became associated wi War Manpower commission as did also the National Rost Scientific and Trained Personnel. The directing board o Procurement and Assignment Service established quotas fo of the states so that a minimum of one physician to civilians would be left in each state while meeting the of the armed forces, with the understanding, however, that tinuous demand might permit extension to a figure o physician to 3,000 of the civilian population.

Arrangements were made for accelerating medical educ decreasing the premedical education to two years and the i ship to one year and making medical education on the qua system continuous so that the complete medical course be limited to three years. Thus a medical education that for required ten years was compressed into a six-year period.

Special regulations were issued by the War Manpower mission providing for occupational deferment of prem students and induction of medical students and interns int armed forces so that they might continue medical educatio interrupted and might be available to the armed forces f ing internship.

To meet the needs of the civilian communities the Comm on War Participation of the American Medical associatio directing board of the Procurement and Assignment Servi Physicians, Dentists and Veterinarians, the United States health service and the Federation of State Medical Lic boards engaged in a joint effort to bring about the issuar temporary licences to practise during the emergency and t location of physicians to meet war needs. diterranean, British Possessions in the.

se comprise Gibraltar, the Maltese islands and Cyprus, of ch the accompanying table gives certain statistics. (*See* also TISH EMPIRE.)

istory.—*Gibraltar.*—Preparations to meet attack by land and continued actively in Gibraltar, and in 1942 details were reed of improved anchorages and dock facilities, the tremendous seaplane base whose aircraft guard convoys and patrol the tern Mediterranean, and the completion of ten miles of tunnel he Rock in which 20,000 men could live indefinitely. Largee land, sea and air manoeuvres were carried out. A few atpted raids by axis bombers were ineffective. During the first k of November, Gibraltar was the assembly point for the U.S.-ish Expeditionary forces which landed in North Africa early he morning of Nov. 8.

n May 30, Gen. Mason Macfarlane was appointed governor commander-in-chief of Gibraltar in succession to Lord Gort, replaced Sir William Dobbie as governor and commanderhief of Malta.

alta.—During 1942, Malta continued its epic defense. By . 21 it had had its 1,660th bombing raid and had destroyed 9 axis aircraft. Heavy property damage was sustained. In letta, 75% of the houses had been destroyed or damaged, the ce of the Grand Masters of the Order of St. John halfroyed, and the Royal Opera house, an architectural gem, ed. Owing, however, to excellent discipline and good rock ters, the loss of life was not heavy. In recognition of the mitable spirit of Malta, King George VI on April 6 bestowed George cross on the island, which thus became the first comnity to receive this honour. The official presentation took place Sept. 13.

A STATUE OF QUEEN VICTORIA in the centre of Valletta, Malta, was one of the few items that escaped destruction during the incessant axis air raids on the city and island in 1942

After the temporary loss in June of British bases in Libya, the supplying of Malta became increasingly difficult, but a long-term agricultural policy insured the cultivation of every scrap of fertile land, and farmers reaped a bounteous harvest. A system of communal feeding utilized local resources; the health of the islanders remained good. To meet the heavy call on manpower a department of national service was established in June for the control of labour in all technical trades. Despite all difficulties the schools were well maintained.

Owing to the greatly increased expenditure, the imperial government proposed during 1942 to give a grant-in-aid of £1,300,000, to which was added the cost of the supply scheme estimated at £700,000. In addition the British government agreed to stand behind the war damage scheme, which was based on the United Kingdom war damage act of 1941.

Cyprus.—In striking contrast to Malta, Cyprus had no serious air raids, but its important strategic position necessitated continual vigilance. The garrison was reinforced by Indian troops and a Palestinian unit, and the volunteer force was strengthened.

Military requirements depleted the forests, but rapid afforestation was aided by a government grant. During the annual "Arbor Week," 300,000 trees were planted by private individuals. The bad harvest of 1941 weakened the agricultural position in 1942.

The introduction of new labour laws at the beginning of 1942,

THE CATACOMBS OF MALTA provided impregnable air-raid shelters for inhabitants of the island in 1942

and the government's recognition of trade unions, were followed by a number of small strikes, chiefly for increased wages to meet the rise in the cost of living, officially stated in June to be 114%. The price control system was also severely criticized. Shortage of certain products led to hoarding by shopkeepers, profiteering and black market activities, notably in gasoline. Austerity measures, however, banned private cars and authorized the requisitioning of tires and other parts for the war effort.

Expenditure for 1942–43 was estimated at £1,418,833, and revenue at £1,194,901. Further expenditure on defense necessitated a grant-in-aid from the British government. Income tax was raised by 25% on all incomes over £200, with allowances for children and life insurance premiums. (L. E. Be.)

Merchant Marine: *see* Shipping, Merchant Marine.

Mercury.

Although the mercury output of the United States had been more than doubled in 1940, a further increase of 16% was attained in 1941, with a total of 44,000 flasks of 76 lb. each, or 1,517 metric tons. Domestic consumption in 1941 was 46,800 flasks, leaving a small deficit to be supplied from stocks. Imports during the first nine months of 1941 were 879 flasks, and exports 1,932 flasks, but indications pointed to an increasing rate of imports during the remainder of the year. New deposits were discovered in Idaho and Nevada, and additions were made to the known reserves in California. Prices had for some time ranged higher than was approved by the Price Administration, and on Feb. 4, 1942, ceiling prices were set at $193 per flask for metal produced in Texas and Arkansas or imported from Mexico, and $191 for all other.

The Mexican production was reported at 797.6 metric tons in 1941, of which 618 tons was in the first eight months of the year, and most of it went to Japan; beginning with September an agreement with the Metals Reserve Co. went into effect, under which the entire output was to be shipped to the United States, but for some reason not explained, the output for the last f months of the year was a full third less than the preceding rat

As a result of war demand Canada developed into a produ of material importance; the plant at Pinchi lake, B.C., enlarged to treat 450 tons of ore per day, and development w was done on deposits in other areas in the province. A sn retort plant was put into operation in March 1942 at the Jacinto mine, near Carora, state of Lara, Venezuela. (G. A. Ro.

Merriam, Clinton Hart

(1855–1942), U.S. biologist author, was born Dec. 5 in N York city. Merriam, who was a research associate of the Sm sonian institution, retired from this post in 1939 after 30 year service. He was renowned as a student of animal and plant and as an authority on Indian tribes of the western United Sta He died in Berkeley, Calif., March 19. (See *Encyclopædia Bri nica.*)

Metallurgy.

Pressure for top production continued to b abundant fruit in the line of new developme in metallurgical processes and practice, which were so numer and so varied that only a few typical illustrations can be m tioned in the brief space available.

Chromizing.—This method of forming a corrosion resist surface by heating steel for an extended time in contact w chromium powder was first suggested in 1936, but had b neglected. It came to the front as a means of conserving H chromium stainless steels where the application requires only surface to have the typical chromium resistance. The absorpt is less than ½ oz. Cr per sq.ft. of surface in a coating 0.00004 thick.

Dry Blast.—Need for improved efficiency in operation led a revival of interest in the application of dry blast in blast f naces, cupolas, open hearth furnaces and bessemer converters.

Flame Hardening.—There was a marked lightening of load in the regular heat treatment furnaces of plants using flame hardening method of treatment for localized hardening.

Metal Working.—Probably the greatest advances in the en field of metallurgy were to be found in metal working, where only the skilled efforts of engineers but also the native ingenu of the workers on the production line combined to produce alm unbelievable savings in working time in a wide variety of chanical operations.

Substitutes.—Scarcity of so many metals commonly availa in plentiful amounts led to an extended application of substitu to save materials short in supply. For example, the use of s in cartridge cases was expected to save close to 300,000 tons copper in 1943, and the use of steel in tanks to save one-th that much aluminum in parts formerly made of that metal.

Welding.—Methods were being developed, perfected and tended to new applications and metals. The construction o welded all-magnesium aeroplane was possible, using sheets, truded shapes and castings, and a modified arc welding proc similar to the atomic hydrogen process, but using helium inst of hydrogen.

Aluminum.—Demand for unusually large amounts of bau to supply the expanding requirements for aluminum caused seri consideration to be given to the development of processes for recovery of aluminum from low grade bauxites, high alum clays, alunite, and other minerals high in alumina content. Ind tions pointed to a considerable development and use of s processes in Europe, and pilot plant work was being done in United States.

Indium.—This metal, though still rather scarce and high price, was a centre of some interest as one of the few that was bject as yet to any limitations in use. The most important ap- cations developed were in brazing and soldering alloys which proved properties because of the greater fluidity and better hesion of the alloy in the joint.

Manganese.—Electrolytic manganese made in the pilot plant erated by the U.S. Bureau of Mines was being used in com- unding the alloy for the new five cent coins, in which silver and nganese replaced the nickel formerly used.

Silver.—Industrial uses of silver were expanding, especially brazing and soldering alloys, which were being used to the ex- it of several pounds total weight in the assembly of certain oes of artillery.

Sponge Iron.—In spite of arguments that its production and was not practical or economic, a test plant was being built the production of sponge iron from iron ore, the product to used as a substitute for scrap in the production of high grade oy steels.

Steel.—A "film" process for the production of steel from pig n was proposed which combined the oxidation procedures of h the bessemer converter and the open hearth furnace. The lten metal is flowed in a continuous film $\frac{3}{16}$ in. thick, in con- t on both sides with air or a previously prepared molten slag, a rate of 1 to 3 tons per minute.

Tin.—The electrodeposition of tin on long continuous strips sheet steel was replacing the standard dipping process of mak- tinplate, since a workable coating could be produced with one- rd the amount of tin.

Extensions in the facilities for detinning and recovery of tin m scrap and tin cans included the construction of a plant handle 60,000 tons a year, recovering 1,970 lb. of scrap steel l 23 lb. of tin per ton. Possible recoveries by detinning were uced to a fraction of their former level, since a large proportion the use of tin cans was already shifted to glass or other types container, and a large share of the tin containers that were still isidered essential were to be used in lend-lease shipments or t to the U.S. armies abroad, with no recovery possible except the small share left for use at home. (*See* also articles on indi- ual minerals.) (G. A. Ro.)

etal Prices and Production: *see* Mineral and Metal ices and Production.

eteorology. **The Weather of 1942.**—On the whole, the winter of 1941–42 in the U.S. was warmer n normal, although in much of the south, locally in the north- t, and in most Rocky Mountain and Great Basin sections the nperature averaged below normal. The outstanding feature of winter was a prolonged period of abnormal warmth, em- cing largely the last half of January and the first half of oruary, with severe wintry conditions immediately preceding l following. The lowest temperature reported in January was 48° in west Yellowstone park, Mont., and in February −52° Taylor Park, Colo. The lowest reported for Alaska was −58° Ft. Yukon.

Spring had mostly favourable weather for agriculture, except t drought conditions developed in the more eastern states, ich, however, were relieved by good rains the latter part of y; subsequent showers furnished sufficient moisture for crop ds. Most of the principal agricultural areas of the country l from near normal to above normal rainfall and temperatures re largely favourable. Consequently, crops entered the summer h good prospects, although in some northern states spring ntings, especially of corn, were delayed considerably by rains l wet fields.

The summer of 1942 was characterized by unusually favourable weather for the development of crops. This season was noteworthy for the persistence of near normal temperatures with practically all sections having seasonal means within 2° of normal. All states east of the Rocky mountains, except Nebraska, Minnesota and Florida had above normal rainfall, in marked contrast to the several dry years in the 1930 decade. With favourable temperature and moisture conditions crops made phenomenal development and at the end of the summer record yields were practically assured. The highest temperature for the summer was 126° at Cow Creek, Calif.

The fall months had too much rain in some interior, eastern and far western states, and unfavourable dryness in much of the south. The most adverse weather feature of the year was the early frosts and freezing weather in the interior and central northern states which resulted in more or less damage to late crops that had not matured; the bulk of corn had developed beyond the susceptible stage but a good many late fields were affected rather extensively, resulting in considerable soft corn. The most damage was sustained by late truck and garden crops, and more extensively to soybeans. Fortunately, following the freeze the weather was ideal for drying out crops that were frosted so that the final loss was reduced from that at first apparent. Otherwise, fall weather was generally favourable.

The temperature for the year as a whole averaged above normal in most sections of the U.S., in keeping with a good many years immediately preceding. Much of the south and a small northwestern area had annual means slightly below normal, but all other areas, except very locally, had above normal warmth though the anomalies were relatively small. The year was characterized by unusually abundant precipitation, with 9 of the 12 months, in general, having above normal, while every month from March to December, except July, had more than the normal amount. The annual average for the United States was 31.10 in., or 7% above normal; 5 of the years 1937–42 had more than

FEDERAL SNOW SURVEYOR in Oregon early in April 1942. By analyzing layers of snow in certain key spots throughout the western United States, engineers are able to forecast the amount of water that will be available for agriculture and hydro-electric plants

normal moisture.

The heaviest local mont rainfall reported was 34.99 at Valsety, Ore., in Novem On an annual basis, the wett state was Louisiana with 56 in., and the driest Nevada, 7 in. By state averages, more th 50 in. of rain occurred in A bama, Florida, Georgia, Lou ana, New Jersey, North Ca lina and Tennessee.

March 1942 brought very usual conditions to the H waiian Islands. While the mo was the second wettest of r ord for the group as a wh the outstanding feature was very uneven distribution rainfall. For example, one s tion on the island of Ma which is less than half the s of Delaware, reported a total 111.75 in., while some other calities on the island had rain at any time during month. Alaska, also, had so heavy autumn rains, the ma mum reported being 40.16 for October at Baranof in southeastern group of islands

Miscellaneous.—Fewer th the normal number of tornad were reported for the year. P haps the most destructive sto of this character occurred Pryor, Okla., and vicinity April 27, when wind, with t rential rains, caused the de of 50 persons and an estima property loss of more than 000,000. Also, a series of hea thunderstorms on Sept. 11 Minnesota resulted in about same amount of loss. In M tana a series of hailstorms July 30 resulted in dam amounting to approximat $1,500,000.

There were several outsta ing floods during the year. February a major flood curred in the Sacramento ba of California, causing an e mated damage of nearly 000,000. Again, beginning April and continuing thro May and into June extens floods occurred in the midw from South Dakota and Min sota southward, being especi severe in the Trinity river Texas where damage estima at about $10,000,000 occur The total losses in this serie

ods reached the impressive al of about $25,000,000. Sev- al bad flash floods occurred ring the year, especially in stern Pennsylvania and adja- nt portions of New York, ich caused crop and property mage of some $13,000,000 d a loss of more than 30 lives, ile nearly as much loss was stained in northern Pennsyl- nia and southern New York. te in December widespread ods covered most of the east- half of the United States and western Oregon. Property loss s considerable and the high water resulted in widespread dis- ption of vital industries. (*See* also DISASTERS: *Natural;* OODS AND FLOOD CONTROL.)

Crop Weather Summary for 1942.—Summarizing the above, weather in the United States during the year was unusually ourable for crops, on the whole, although there were a few verse conditions, such as too much rain in northern states ring part of the season, deficient moisture with an early summer ought in the east and south central states, and untimely early l frost in several sections. The active growing season, May August, had a country-wide average of 12.12 in. of rainfall, king it one of the wettest seasons of record. This was approxi- tely 4 in. in excess of that in the 1934 and 1936 drought years, ich means, on the average for these 4 months, a difference of ne 450 tons of water for every acre of land in the United ates. Rainfall was unusually well distributed geographically l temperatures were largely favourable.

The importance of good weather to the United States, and espe- lly the farmer, was emphasized by comparing the agricultural tput in 1942 with that for two previous dry years, 1934 and 36. The unprecedentedly high yields of 1942, compared with the mediately preceding favourable years, were accounted for in ne measure by wartime efforts for greater production, in some es to improved seed, such as hybrid corn, etc., but the enomenal increase over the drought years was due primarily the difference in the weather. For example, the department agriculture summary of 1942 production showed that the nbined output of four important small-grain crops (wheat, s, rye and barley) was nearly 1,500,000,000 bu. in excess of average for 1934 and 1936; this represented an increase of re than 100%. Production of corn was more than 1,500,- ,000 bu. up, while hay showed an increase of more than 000,000 tons.

Research.—Investigations in the long-range prediction prob- n, conducted by collaborating meteorological offices of the ny, navy and weather bureau, confirmed the general opinion practising meteorologists that the most dependable indexes veloped for the longer time-range were to be found in statistical erpretation of known details of climate.

The "spot-weather" forecasting technique promised a limited t definitely worth-while usefulness to armed units operating yond the reach of more generalized forecasting service—in h areas, for example, as the south Pacific islands. The method, rther developed by intensive experiment and study in 1942, s to apply refined methods of interpretation to surface and per-air observations made at a single ground station. Repre- nting a continuous measure of humidity, temperature, pressure, nd direction and wind velocity through the atmosphere directly ove the point of observation, these observations provided the erpreter a reasonably dependable index to short-term meteorological changes for the surrounding area within a radius of a few hundred miles. The local-area studies, designed to answer meteorological questions bearing upon military field operations, proved the immense practical usefulness of meteorological information as a contributory factor in aerial and expeditionary tactics.

Operations.—With the wartime cessation of weather reporting from ships at sea and from Europe and Asia—reports heretofore considered indispensable to forecasting for periods greater than 48 hours in length—the dependability of forecasts for periods of 5 or 6 days seemed seriously threatened. The deficiency was mitigated as much as possible by adjustments in interpretative methods, by expansion of the observing field and by special observing and reporting procedures for receiving weather information from aircraft in transoceanic flight.

Demands for accurate meteorological advice to meet specific wartime needs necessitated specialized forecasting in several instances—*e.g.,* for safeguarding manufacture, for convoying operations, for transcontinental ferrying of aircraft and for large-scale transoceanic flights to Europe and elsewhere. The procedures varied from the assignment of a specialist to a middle west forecasting centre to predict thunderstorms for munitions plants, to the staffing of large coastal stations with experts in the forecasting of weather conditions for transoceanic flights.

The objective of the national censorship was to withhold significant weather information from the enemy without failing the essential requirements of civilian commerce and agriculture. To accomplish this, all regular announcements by radio were stopped early in 1942, except for the issue of warnings of storms or other conditions sufficiently severe to threaten life or property; issues of significant detail were withheld from press or other publication for one week; tables of current temperature, pressure, precipitation and wind data previously published in newspapers were reduced in quantity and detail; and the Office of Censorship, collaborating with the weather bureau, censored all weather-news reporting in story or report form by the press and radio. The system was generally effective and successful, though in several instances, particularly of outlying public utilities which had previously depended upon the radio for weather information to guide their activities, the establishment of special services for providing information on temperatures, winds and glaze storms was necessary.

In addition to structural improvements in the radiosonde and the production of a potential gradient recorder to indicate the approach and intensity of electrical storms, an outstanding instrumental advance of 1942 was the development of a ceiling light projector for determining by actual measurement the elevation of cloud ceilings during daylight as well as darkness. The electrical-storm detector, developed at the University of New Mexico, should prove particularly useful as a safeguard to personnel and stores at munitions manufacturing plants between the Allegheny and the Rocky mountains. The ceiling light projector represented a fundamental contribution to safety in aircraft operations. The instrument consists of two parts: a projection unit which emits a pulsating vertical light-beam, and a photronic receiver with tuned amplifier and meter. In operation, the telescope of the receiver, trained upon the beam from a known horizontal distance, is rotated upward along the beam until the "light spot" on the base of the cloud layer (coinciding with the point of maximum output of the amplifier) is reached. From the angular elevation of the telescope the ceiling height can then be readily computed. Since the receiver's meter responds only to the pulsating beam, regardless of the intensity of the prevailing natural light, the instrument operates as well by day as by night.

Under plans formulated in 1940, close and informed collaboration continued between military services and the weather bureau to provide the fullest possible benefit of meteorological services to military operations with the least loss to civilian interests. Significant points in the organization of 1942 were:

(1) The weather bureau maintained the basic network of some 500 synoptic observing stations within the continental United States, Alaska, the Hawaiian Islands and the Caribbean. These reports were distributed via 56,000 mi. of teletype lines to the offices of the weather bureau, army airfields and military meteorological training fields; and all weather forecasting, military or civilian, was based upon them.

(2) The weather bureau and the military services collaborated with five American universities in the training of young men and women in professional meteorology. Qualified graduates (already numbering several hundred) were eligible for commissioned status in the weather bureau or the armed services.

(3) The weather bureau maintained the basic forecasting service for civilian, commercial and military needs; but at military flying fields army forecasting units served the specialized and individual military aviation training and operations.

(4) All major meteorological problems involving the military services were decided by a consultative body consisting of representatives of the weather bureau, the U.S. army air forces and the bureau of aeronautics of the navy. For consideration of meteorological questions of international scope, these consultations included accredited meteorological representatives of the foreign nations concerned. (F. W. Rr.)

Other Countries.—The values for monthly rainfall and monthly mean temperatures given in the tables on pages 438 and 439 referring to countries outside the United States are provisional and may in some cases require a small correction. On account of war conditions it has not been possible to give complete data for some of the stations. Gaps in the tables indicate that the data could not be obtained. (D. Bru.)

Methodist Church.

Prior to the Japanese attack on Pearl Harbor, Dec. 1941, the Methodist Church was a centre of active pacifist propaganda in general conference press and pulpit. Vestiges of this still remained, especially in student groups, though in May 1942, the council of bishops adopted a resolution expressing "high appreciation of the nobility of the sacrifice which the youth of our Methodist homes and churches are making in military service at the call of our nation." Voluntary enlistments of Methodist ministers as chaplains in the armed forces were less than 60% of the quotas. The number of Methodist boys in the Civilian Service camps exceeded that of any other denomination of its rank. Not only did offerings for overseas relief continue on a high level, more than $1,250,000 having been given since March 1941, but all collections reflected the improvement of general financial conditions because of increased employment and higher wages. Receipts of the Commission on World Service and Finance for the fisc year ending May 31, 1942 were $4,324,150, a gain of $137,88 The Episcopal fund (salaries and pensions of bishops) reach the unprecedented total of $638,963, and the general administr tive collection rose to $140,175. A financial survey of the tot Methodist church giving in the second year of the unification Methodism 1940–41, showed total giving of $88,908,330, which $34,789,412 was for ministerial support; $20,131,317 f other local church current expenses; and $21,046,329 for buil ings and indebtedness. For benevolent causes the total w $12,764,965, about one-seventh of the whole. The publishi house declared a dividend of $200,000, which is double that 1941.

Although the war in eastern Asia and the Indies seriously e barrassed mission work and necessitated the recall of worke from Japanese controlled areas, activities were not at a stan still. Of the China force, about 180 in normal times, 21 remaine at their posts in occupied China, while 46 were in Free (Wes China. Of the rest 37 were "on emergency furlough due to wa Of the 167 workers of the woman's division 56 served in Free a 32 in occupied China; 40 were on furlough and 29 were engag in Christian work in other fields or in the United States. Mo of the higher institutions of learning which were maintaine wholly or in part by American Methodists migrated to We China "for the duration."

In Japan itself one male missionary and four women remaine at their posts, disregarding the timely recall which the Ne York office issued before Pearl Harbor. All came away fro Korea, though a number of these found work in other field When Malaya was overrun by the Japanese, Bishop Lee of Sing pore brought most of the missionaries home by way of Australi In most instances, native pastors and teachers were left to car on the churches and schools. The "sealing" of the Philippin cut off all the missionaries in the islands from escape. They we still in and around Manila, and were carrying on the work best they could under the circumstances. Burma was evacuate Elsewhere in India, Africa and South America activities pr ceeded as usual. At least three American workers were strande in nazi Europe. The Methodist census for 1942 in the Unite States was incomplete at the close of the year. However t official figures of membership on June 1, 1942, showed a total 6,539,595, which is a net gain of 43,650, with less than one-ha of the annual conferences reporting.

Great Britain.—On July 13, 1942, the Methodist conferen met in a four-day session in Manchester, in reduced number Membership showed a decline of 12,000, bringing the total 759,869, a loss of about 100,000 since the union in 1933. T Rev. W. J. Noble was elected president for the year; Herbe Ibberson, a Yorkshire layman, vice-president, and the Rev. Edw Finch, secretary. Officers designated for 1943 were the Re Leslie F. Church, president and Charles T. Nightingale, vic president. The Fernley-Hartley lecturer for 1943 was to be t Rev. F. B. Clogg. Financial reports were somewhat encouragin Home missions receipts advanced and the debt was reduced £15,320. Total receipts of the War Emergency fund reache £157,841, of which £50,000 came from the Methodist Church the United States, £10,000 from South Africa, £14,500 fro Australia and £4,500 from Canada. The trustees of the confe ence reported the largest receipts in the history of the fun £41,366. The principal in 1942 was £526,435. A resolution sympathy for the people of France was adopted and ordered se to General De Gaulle, leader of "Fighting France," not to Marsh Pétain. Actions of importance were taken with regard to de conesses and youth. The status of the deaconess group was i proved, and a comprehensive plan for a youth department, co sing Sunday school and Methodist guild and the newer groups young people, was approved. Rev. A. William Hopkins, R.A.F., s designated secretary of this organization.

It was reported that 1,227 chapels and 242 manses had suf- ed damage in air raids, half of them destroyed. First aid to amount of £27,000 had been loaned from emergency funds. entually the government would make good the war loss. The olution of support for Premier Churchill was unanimously opted. The 1943 conference was to meet in Birmingham.

(J. R. J.)

exico. A federal republic of North America lying between the United States and Central America. Area, ,168 sq.mi.; pop. (1940) 19,473,741. Approximately 55% the population was mestizo, 29% Indian, 15% white, with eigners and others making up less than 1%. The language is nish, but an estimated 14% speak only Indian tongues. There no official state religion, but the people are overwhelmingly man Catholic. The capital is Mexico City (pop. 1,464,556). ier principal cities are: Guadalajara, 228,049; Monterrey, ,942; Puebla, 137,324; Mérida, 98,334; León, 86,089; npico, 81,334; Aguascalientes, 81,124; San Luis Potosí, 042; Torreón, 76,613; Veracruz, 70,958; Chihuahua, 57,456; chuca, 52,387. The president in 1942 was Gen. Manuel Avila nacho (took office Dec. 1940).

History.—The most outstanding event of 1942 in Mexico was declaration of war against Germany, Italy and Japan. This laration, unanimously approved by both houses of congress May 29 and 30, went formally into effect on June 1. It came the culmination of a series of events which thoroughly aroused country against the axis. At the Rio de Janeiro conference foreign ministers of the American republics, Jan. 15–28 (*See* SPANIC AMERICA AND WORLD WAR II), Mexico's foreign min- r, Ezequiel Padilla, was an outstanding leader in the move to sent a united American front by a general severance of lomatic relations with the axis powers.

The earlier months of the year saw Mexico strengthening her ustries, improving her defenses, and generally striving for ernal unity. Until May the break with the axis was diplomatic y. On May 13, however, a Mexican tanker, the 4,000-ton otrero de Llano" was torpedoed off the Florida coast. Mexico thwith gave Germany, Italy and Japan what was in effect an ultimatum demanding complete satisfaction and a guarantee of reparations by May 22. Meanwhile, popular demonstrations against the axis took place throughout Mexico. A second Mexican tanker was sunk on May 20, and as the ultimatum deadline approached, the government took steps to freeze axis assets in Mexico and to put the armed forces on the *qui vive.* Pres. Avila Camacho and his cabinet met to make the war decision while throngs demonstrated in the streets of the capital. The declaration itself was followed quickly, on June 5, by formal adherence to the United Nations declaration and the Atlantic Charter and, on June 15, to the covenant originally signed by Great Britain and the U.S.S.R., under which all signers pledged to make no separate peace with the axis.

Internally, one of the government's earliest war moves, following suspension of certain constitutional guarantees, was to seize axis-owned properties. These holdings, estimated at between 200,000,000 and 250,000,000 pesos in value, consisting largely of real estate, mines, securities and some 25,000,000 pesos of commercial enterprises, were placed under control of a government board of administration.

Broadly, public opinion rallied behind two of the most outstanding figures of the country—Gen. Lázaro Cárdenas, predecessor of Pres. Avila Camacho, and Vicente Lombardo Toledana, long Mexico's most powerful labour leader. Gen. Cárdenas, who had been placed in command of the Pacific defense area in Dec. 1941, became minister of national defense in Sept. 1942, assuming the task of bringing about a large-scale expansion of the army. Lombardo Toledana, head of the Confederation of Latin American Workers, visited the United States in April to confer with labour leaders and government officials on efforts for the full co-operation of Latin-American workers in the United Nations war effort. To this end, in September, he undertook a trip around Latin America. Another ex-president, Gen. Abelardo L. Rodríguez, an able soldier as well as one of the country's most capable businessmen, took command of the Gulf of Mexico military area, a district of major importance in view of the extensive axis submarine activity in the gulf, and subsequently became national co-ordinator of industry.

On Mexico's Independence day (Sept. 16), as a symbol of national unity, all of the country's six living ex-presidents, between some of whom great bitterness and personal animosities had previously existed, assembled with Pres. Avila Camacho to join in the official celebrations in the national capital.

Despite these and other manifestations of national unity,

ETING OF THE MEXICAN WAR COUNCIL in the national palace at Mexico
, Sept. 24, 1942. At this meeting President Avila Camacho, at right, ex-
ned Mexico's war plans

several elements in Mexico, notably the powerful Sinarquistas, caused some concern. Early in 1942 this fiercely nationalistic and anticommunist organization, whose membership was drawn largely from the rural farming population in the more conservative and strongly clerical states, showed some fascistic and pro-axis leanings. Following Mexico's entry into the war, however, the official head of the Sinarquistas, Manuel Torres Bueno, endorsed national unity and, pledging full support of the war effort, exhorted the Sinarquista farmers to increase agricultural production as their contribution to the national cause. Torres Bueno's stand allayed the fears of many that Sinarquism would be a tool of axis agents, but distrust of the movement continued to be felt by many, both in Mexico and elsewhere.

A focal point of attention in the matter of food production was the Second Inter-American Agricultural conference, which met in Mexico City July 6 to 16 with delegates from all 21 of the American republics present. The conference's keynote was a plea for maximum production of food and strategic war materials so as to insure victory over the axis and then to provide a higher standard of living for the peoples of America and the world.

During this conference efforts were made to arrange for the emigration of Mexican labour to the United States to prevent the threatened loss of fruit and vegetable crops due to the manpower shortage in that country. The possibility of the use of Mexican labour in the United States in both agriculture and mining was explored by officials of both countries. Its success was limited during 1942, however, owing to the late start and to Mexico's desire for adequate guarantees of wages and working conditions, immunity from military service, and return to Mexico on the expiration of their contracts.

The agricultural conference likewise gave serious consideration to commercial production of rubber and its substitutes. A project for the intensive cultivation of fast-growing rubber-producing plants was pushed, with special emphasis on the guayule of the semideserts of northern Mexico. Some hope was offered that the production of guayule in 1942 might equal Mexico's all-time record of 10,687 tons set in 1910. Concurrently with the conference, Mexico and the United States signed an agreement whose objective was the stimulation of natural rubber production in Mexico through United States financial aid and technical assistance. The first step was the establishment of five 750-ac. demonstration plantations in southern Mexico. Nearly 1,000,000 test seeds, 25,000 grafted plants and 250,000 rubber-producing shrubs of different varieties were made available for planting.

During 1942 the national land program regained some of the momentum it had lost in the previous year. Under an extensive program outlined by the government in March, more attention was given to precise surveys and to perfection of land titles. At the same time it was noteworthy that large landholders had become more nearly reconciled to land partition. In addition, emphasis was made by the Avila Camacho administration on increasing productivity.

Another trend of great importance in Mexico was the evident desire on the part of the Avila Camacho administration to end the conflict with the church. A tacit understanding had been reached in Pres. Cárdenas' administration (1934–40) by which the church was allowed to operate without much governmental opposition. However, the Avila Camacho government went much further. First, it nullified the ban against religious teaching in schools by ruling that such teaching would not be interfered with in private schools; then, under a decision of Mexico's supreme court early in August, confiscation of church property, except in the case of actual church buildings, was held to be
unconstitutional. This decision paved the way for the reope
of the schools of the church orders, and possibly the restora
of much of the confiscated property.

Closely allied to world events was the question of Spa
born residents of Mexico, estimated to number more than 35
Efforts to settle the more recently arrived, practically al
whom were refugees, in agricultural colonies, were made diff
through the influence of the Spaniards of long residence in
country, many of whom were known to be pronounced sy
thizers of the Franco dictatorship in Spain.

On April 18, 1942, an agreement was reached with the U
States for settlement of the long-standing controversy over
oil properties expropriated by the government of Mexic
March 18, 1938. A valuation of 119,979,955 pesos ($23,995,
was reached by the United States and Mexican experts, a
considerable reduction from the company claims of bet
$150,000,000 and $200,000,000. This was in addition to ea
separate settlements made with Sinclair Oil company ($8,500,
and with Cities Service ($1,100,000). At the same time
companies were released from all claims against them ex
for unpaid taxes and duties, or such payments as had been
on their behalf by the Mexican government. The amounts
each company were to be paid in five annual instalments be
ning July 1, 1943. Claims of British and Netherlands compa
whose oil properties had been expropriated remained still
settled, however. The United States companies affected
pressed themselves as thoroughly dissatisfied with the settle
asserting that the liability for taxes and duties left them p
tially with almost no net settlement at all.

On its part the Mexican oil industry regarded the agreeme
opening the way for a considerable improvement in Mexica
export through a 400% increase in the export quota to
United States. The actual effect was even greater, for by
close of 1942 the quota restriction was entirely lifted.

Just prior to the oil settlement, Foreign Minister Padilla,
the United States undersecretary of state, Sumner Welles, is
a joint statement on arrangements for increasing Mexico's
time production. The plan included the establishment in Me
of "basic" industries of steel and tin plate, and a surve
Mexican railroads and shipbuilding possibilities. Funds
the United States Export-Import bank were to be used to o
the necessary equipment, materials and machine tools.

General claims of citizens of the United States against Me
were the subject of a settlement, the machinery for which
arranged in Dec. 1942. This was the so-called "global" settle
by which a stabilization loan of $40,000,000 was made to Me
by the United States treasury for the payment of claim
American nationals. The claims dated back as far as 1869,
did not include those relating to petroleum.

Rehabilitation of Mexico's railroads was begun shortly
the Padilla-Welles arrangements. An army survey was instit
and in the meantime, the United States government was qu
casting around for the necessary capital. There was a dire
of rolling stock, locomotives and other equipment. Rails
roadbeds were insufficient, and the railways were in nee
refinancing. Purchases in the United States were made of
and used freight cars, including 4,000 built for another L
American country, but to which delivery was impossible bec
of the shipping shortage. In October a special Mexican mis
visited 30 United States railroads in order to buy rolling s
It was hoped thus to obtain 30 locomotives and 300 tank ca

Business in general during 1942 was characterized by se
factors, many of them due to war conditions. One of the
noticeable changes was the sudden shift to a favourable bal
of trade and the decrease in tourist business. An intere

siness activity in Mexico was the continued boom in construc- n in Mexico City. Permits were granted ranging from 7,000,000 10,000,000 pesos monthly, with rents and prices still holding n. Much of the real estate activity was ascribed to a general gration to the capital of persons from the rural districts, and ir desire to find relatively safe investments.

Not the least of the commercial activities was the fast-growing xican motion picture industry, which threatened to supplant gentine and Hollywood films in Latin America.

ducation.—Education is free, compulsory, and divorced m religion. Private schools, however, may teach religion. In 1 Mexico had 23,181 primary schools, with 2,037,870 enrol- nt (about half the children of school age). Secondary schools 1942 had about 80,000 enrolment and the country's ten versities around 30,000. There were more than 100 technical ools, including 30 vocational agricultural schools for Indians l 91 for adult education.

ince 1930 illiteracy had been reduced from 50% to 45% less, largely through rural education among the Indian popula- n. Rural education is supported by the federal government, an by the states and municipalities.

efense.—At the outbreak of war Mexico's army comprised ne 70,000 men, with about 400,000 partially trained reserves; navy consisted of three 2,000-ton gunboats, 11 armoured stal patrol vessels and one heavy transport. A conscription gram was begun for all men between the ages of 18 and 46. er the outbreak of war, large quantities of land, air and naval ns and war materials, including patrol boats, were furnished xico under lend-lease agreements with the United States.

inance.—The monetary unit is the peso (value in 1942, ap- ximately 20.65 cents U.S.).

During 1942 bank circulation increased approximately 15%. ween June 14, 1941 and July 10, 1942, bank loans rose from ,199,000 to 316,889,000 pesos.

rade and Communication.—While imports exceeded exports ing 1941, the process was reversed in 1942, and the total vol- e greatly increased.

xports in 1941 totalled 728,800,000 pesos as against 960,000,- pesos in 1940. However, an increase in foreign trade was dent by the fact that exports equalled 521,100,000 pesos for first six months of 1942, a heavy increase over 1940, one of peak years of Mexican foreign trade. The lifting of the ited States quota system on oil was expected to bring an even ater upswing in exports. Gold, silver, copper, lead, zinc and comprised the bulk of Mexico's export goods. Beef, henequen, natoes and *huarachos* (sandals) also stood high on the export . Chicle, coffee, chick peas, cotton, vanilla, guayule, vegetable and fodder were also exported in appreciable quantities.

mports in 1941 were 914,500,000 pesos as compared with 668,- ,000 pesos in 1940. During the first six months of 1942, im- ts aggregated 409,100,000 pesos. This was above normal even ugh somewhat under the 1941 rate. Manufactured articles, luding machinery, composed the largest single category of im- ts. Wheat was also imported in substantial quantities during 2. The above figures do not include munitions of war.

xternal communication is by sea, especially through Veracruz; three main railways to the United States and one to Guate- la; by air to all parts of the hemisphere; and by highway, ably through Nuevo Laredo to the north. In 1942 railway nmunication to Guatemala was notably bettered through the ning of a bridge permitting direct traffic without transship- nt.

he national railway system (14,500 mi. in 1942) links the re important population and industrial centres. There were re than 36,000 mi. of improved roads in 1942, of which 4,500 mi. were paved. The Inter-American highway, already complete from the United States to south of Mexico City, was being rapidly carried to the Guatemala border in 1942. In 1940, 23 domestic air routes carried 86,599 passengers, 3,460 tons of freight, and 272 tons of mail.

Agriculture.—Mexico has an estimated 15,000,000 hectares of tillable land (1 hect. = 2.46 ac.), of which 5,429,375 hect. were under cultivation in 1940 and an estimated 7,000,000 hect. (or 3.5% of the total area of the country) in 1942. Forest land comprised 10,483,398 hect. and grazing land 28,224,176 hect. In 1940 there were 26 irrigation districts comprising 2,742,910 hect., of which 832,840 hect. were irrigable, with 445,833 hect. actually under irrigation and an additional 212,141 hect. in dry farming.

The outstanding agricultural products (with 1941 tonnage) are: maize 124,085 tons (1942 est.: 2,000,000 tons); wheat 316,000 tons (1942: 430,000 tons); rice 113,310 tons (1942: 130,000 tons); beans 139,000 tons (1942: 180,000 tons); green peppers 30,945 tons; tomatoes 126,376 tons; vanilla 216 tons (in 1940); sugar cane 5,677,398 tons; flax 7,950 tons; tobacco 19,633 tons; cacao 2,655 tons; limes 53,366 tons; bananas 370,643 tons (in 1940); henequen 94,721 tons (in 1940); coffee 119,256 tons. Timber produced commercially includes pine, spruce, cedar, mahogany, rosewood and logwood.

Manufacturing.—In 1941 production in certain selected industries (estimated to represent 62.17% of all production) was valued at 1,085,031,000 pesos. In 1942 Mexico experienced a great expansion in manufacturing, with some industries reporting as much as 300% increase over 1941 totals. During the year $11,-000,000 was invested in 101 new industrial organizations. These included 18 small mining companies and 25 chemical laboratories. Steel production was especially active during the year, with plants running at full capacity. Only in the ports of Veracruz and Tampico, which were adversely affected by shipping disruption, was there any serious unemployment.

Mining.—Mining is basic to Mexico's national economy. Mexico in 1942 ranked first in world silver production, second in lead, and fourth in gold. Metallic production and value in 1941 was: gold 24,822 kg. (136,000,000 pesos); silver 2,437,392 kg. (133,-000,000 pesos); copper 45,716 tons (56,600,000 pesos); lead 155,259 tons (102,200,000 pesos); zinc 155,231 tons (128,000,000 pesos). Great stimulation was given to mining of strategic war minerals, especially zinc, copper, graphite and iron, during 1942.

Petroleum production was 41,160,000 bbl. in 1941. Refinery capacity was increased to 165,000 bbl. daily. The oil industry at the beginning of 1942 had ten tankers with a combined capacity of 1,225,000 bbl. In addition nine interned Italian tankers were added to Mexico's tanker fleet. (*See* also INTERNATIONAL LAW.)

B. Parkes, *History of Mexico* (1939); Frances Toor, *Guide to Mexico* (rev. ed. 1940); Lesley B. Simpson, *Many Mexicos* (1941). (C. L. G.)

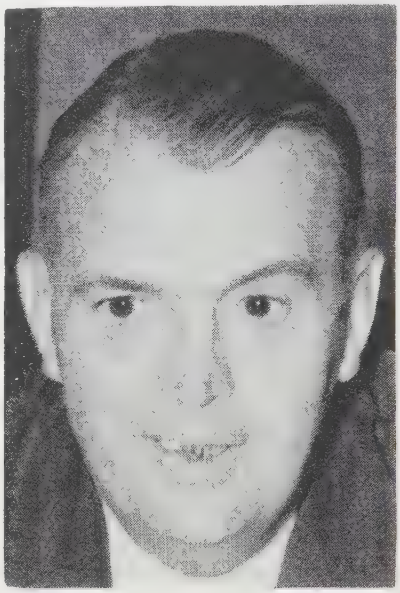
Mica. No official report was made on mica production in the United States in 1941, but there were indications of an increase of about one-half over the 1,625,437 lb. turned out in 1940. Imports were not reported, but apparently increased materially. Canada was the only country for which 1941 data had been received—1,744 short tons produced, as against 975 tons in 1940. (G. A. Ro.)

Michigan. One of the north central group of states, Michigan was the 26th state admitted to the union; it is popularly known as the "Wolverine state." Area, 97,940 sq.mi. (including 39,960 sq.mi. of Great Lakes' water surface);

pop. (1940) 5,256,106; (estimate Jan. 1, 1943) 5,600,000. Of the state's population in 1940, 3,454,867 were urban, or 65.7%; 1,801,239, or 34.2%, were rural. Whites comprised 95.892% of the population, nonwhites 4.108% (215,934). Capital, Lansing (78,753).

Larger cities were Detroit (1,623,452); Grand Rapids (164,292); Flint (151,543); Saginaw (82,794).

History.—Wartime conditions made 1942 a particularly eventful year for Michigan because of the prominent place which the state's facilities took in the war production program. On the industrial side the most conspicuous development was the conversion of the huge automobile industry to war production. Not only were existing resources utilized by this industry; marked extension of resources occurred, the most conspicuous example being the opening of the Ford bomber plant, with facilities for the employment of 80,000 persons, at Willow Run, near Ypsilanti. Practically every urban centre in the state had at least one manufacturing plant which had been converted to war production.



HARRY F. KELLY, Republican, elected governor of Michigan Nov. 3, 1942

Thousands of Michigan residents flocked from the less populous areas to the manufacturing centres; many more thousands poured into Michigan from other states. According to estimates of the United States bureau of the census, the Detroit area (including Wayne, Oakland and Macomb counties) by May 1, 1942 had reached a population of 2,710,000—representing an increase of 336,000 from the 1940 figure; the second half of 1942 saw the increase continuing. This swift augmentation of the population of the manufacturing centres created acute housing problems, with numerous trailer communities and small-house settlements springing up.

In the election of Nov. 1942 Judge Homer Ferguson, Republican, defeated Senator Prentiss M. Brown, Democrat, for U.S. senator. Brown had achieved considerable prominence during the summer and fall as the chief supporter in the United States senate of President Roosevelt's price control program. Gerald L. K. Smith, who ran as an "Independent Republican" candidate, polled only a few thousand votes. For the seventh time in as many successive gubernatorial elections, Michigan voters chose to restore the governorship to the party currently in opposition. Harry F. Kelly, Republican, defeated Gov. Murray D. Van Wagoner, Democrat, by a margin somewhat larger than that in the senatorship race. Indeed, the Republicans obtained the election of their entire party slate. Dr. Eugene C. Keyes was chosen lieutenant governor; Herman H. Dignan, secretary of state; Herbert J. Rushton (incumbent), attorney general; Vernon J. Brown (incumbent), auditor general; D. Hale Brake, state treasurer (defeating the veteran incumbent, Theodore I. Fry). In the nominally nonpartisan contest for justice of the state supreme court, Raymond W. Starr, incumbent, who had been endorsed by the Democratic party, defeated Earl C. Pugsley, whom the Republicans had sponsored. With Republicans winning 25 of the 32 seats in the state senate, and 73 of the 100 seats in the house of representatives, the position of the Democr was left very weak. This condition was intensified in Dec. 1 by Gov. Van Wagoner's decision to withdraw from leaders in state politics and by the resignation of State Highway Co missioner Donald E. Kennedy, who had been Van Wagon closest political assistant.

Michigan's constitution requires that the question of whet to authorize a convention for its general revision must submitted to the electors every 16 years. In the November el tion the electorate decided against this step. The electors a rejected a proposal to authorize general reform in Wayne cou (county seat, Detroit) government; a proposal dealing with m marketing was likewise defeated.

Education.—The 5,555 elementary schools of the state had enrolment of 582,263 in 1942; they were staffed by 19, teachers. Secondary schools numbered 763, with 388,041 pu and 12,881 teachers. State expenditures for public scho amounted to $107,189,177.15.

Public Welfare, Charities, Correction.—During the fi 11 months of 1942, a monthly average of 31,000 cases represe ing 95,000 persons received a total of about $8,197,000 in di relief. The load, however, from January to November fell 44.12 WPA employment likewise fell from 32,899 workers in Janu to 11,844 in November. Old-age assistance grants were made a monthly average of 92,134 persons; payments from Jan. 1 Dec. 1 totalled $19,692,383, or approximately $19.43 mont per recipient. Aid to dependent children saw a gradual dec between January and December, reflecting improving empl ment opportunities. An aggregate of $9,698,722 was paid 21,392 cases in behalf of 47,230 children during the 11-mo period. Pensions to the blind during the same period total $396,250, and were distributed to a monthly average of 1, cases.

There was a generally steady and sharp decline in the numbe claims filed for unemployment insurance, from the week Jan. 10 to that of Nov. 28. In the former, 177,348 claims w filed, and the value of checks issued was $1,565,560; in the lat week, only 10,086 claims were filed, while the value of che issued was $112,833.

On Dec. 1, 1942 there were 7,556 inmates in Michigan's f correctional institutions. New prisoners committed in the months ending Dec. 1, 1942 numbered 2,337.

Communications.—Michigan had 9,595 mi. of trunk highways and 80,606 mi. of county roads in 1942. State oper ing expenditures on highways in 1942 totalled $60,924,833 Railroad mileage at the end of 1941 amounted to 7,438 War demands for the ore supplies of the Northern peninsula of the other states bordering on Lake Superior increased many thousands of tons the shipping passing through the lo at Sault Sainte Marie.

Banking and Finance.—Total assets in banking instituti in 1942 were as follows: state banks, $1,029,362,011.35; dustrial banks, $7,581,389.43; trust companies, $36,218,421 For the fiscal year ending June 30, 1942, revenues credited the general fund of the state treasury amounted to $170,55 459.51; operating expenditures from this fund were $147,3 158.16, leaving a surplus of $23,215,301.35. Revenues credi to the state highway fund totalled $64,981,968.72; expenditu were $60,924,833.34. The end of the fiscal year thus saw considerable surplus in the treasury.

Agriculture.—Total estimated value of agricultural product in Michigan in 1942 was $421,628,000; total acreage harves 7,940,000. Despite considerable crop losses due to exces moisture and early frosts, the 1942 production of corn, o beans, soybeans and alfalfa was the highest on record.

	.	.	6,726,912	6,151,154

anufacturing.—The year 1942 witnessed a tremendous in- se in manufacturing in Michigan; latest official statistics lable, however, were for the year 1939. In that year the l value of manufactures was $4,348,223,244; total employed manufacturing, 621,173; total salaries and wages paid, 27,488,238.

lineral Production.—Wartime demands upon Michigan's eral resources brought a marked increase in production in . Estimates placed production figures as follows: iron ore, 00,000 tons; copper, 10,000,000 lb.; oil, 20,000,000 bbl.

BLIOGRAPHY.—*Michigan: A Guide to the Wolverine State* (American e Series, 1941); *The Michigan History Magazine*, quarterly; press re- s and printed reports of the various governmental offices; *Michigan al Directory and Legislative Manual*, published by the secretary of biennially. (L. G. V. V.)

chigan, University of.

The University War board enlarged its facilities for inform- students about the national services. To accelerate training, a calendar of three terms, October–January, February–May, June–September, was adopted, with the result that Com- cement was held on May 30, nearly a month early, and 3,860 ents attended the full summer term, besides 2,708 in the ter summer session. The courses in subjects important for the effort were revised and augmented, and preinduction training rams arranged in co-operation with the army and navy. A ired physical conditioning course was instituted. Engineering, nce and Management War Training courses were given to oximately 4,000 persons between April 1941, and July 1942, instruction in subjects such as electronics, ordnance materials ection, and radio was furnished to numerous groups of gov- ient trainees. The Judge Advocate General's school of mili- law was moved from Washington to Ann Arbor. Many lty members engaged in confidential government research ects, and 78 others, by July 17, had been granted leave of ab- e for military or civilian service. Aside from war activities, the erection of the new school of public health building went forward with expectation of occupancy in Feb. 1943. The Rackham Educational memorial, which houses the Detroit extension work of the university, was dedicated in Jan. 1942. (A. G. R.)

Midleton, William St. John Fremantle Brodrick,

1ST EARL OF (1856–1942), British statesman, was born Dec. 14, the oldest son of the 8th Viscount Midleton. He entered parliament in 1880 and was seated in the house of lords in 1907. He was prominent as a leader of the southern Unionists of Ireland, and served on the Irish convention in 1917 and 1918. In his memoirs, he recalled an interview with Kaiser Wilhelm in which the German emperor assertedly declared that he wanted to seize some South American state as an outlet for Germany's overflowing population. The Kaiser, Lord Midleton said, believed he could defy the Monroe Doctrine if he could land his troops. Lord Midleton died Feb. 13 at his residence, Peper-Harow Park, Godalming, Surrey. He was the author of *Ireland, Dupe or Heroine* (1932) and *Records and Reactions, 1856–1939* (1939). (See *Encyclopædia Britannica.*)

Midway, Battle of: *see* JAPAN; WORLD WAR II.

Midway Islands.

A group of two small islands and several sand islets of the Hawaiian group lying in longitude 177° 23′ W. and latitude 28° 13′ N., 1,149 mi. N.W. of Honolulu, possessions of the United States of America. Sand, the larger island, about 850 ac. in area, has a maximum height above sea level of 43 ft.; the smaller island, Eastern, about 328 ac. in area, is very low.

The islands are enclosed in a circular reef about five mi. in diameter, nearly four-fifths of which is above water. They are nonproductive, being little more than sand dunes, and have no native inhabitants. Sand Island is the site of a commercial cable station.

In 1859 Captain Brooks of the U.S.-owned Hawaiian bark "Gambier" discovered the group and took possession in the name of the United States. Formal possession was taken Aug. 28, 1867 by Capt. Reynolds of the U.S.S. "Lackawanna." An executive order dated Jan. 20, 1903, placed the islands under the control and jurisdiction of the U.S. navy department. Under licence from

OIL TANK burning on Midway during the Japanese attack in June 1942 this department Pan American Airways established facilities on Midway for use in connection with its transpacific commercial airline. The 76th congress authorized the navy department to construct a seaplane base at Midway and appropriated approximately $5,000,000 for the purpose. Construction work on this base was in progress in 1941.

Midway was attacked by Japanese naval and air units Dec. 7, 1941. For a number of days no word was received from the small group of U.S. marines there, and the islands were believed lost. The defenders finally beat off all attacks, however, and by 1942 the island was firmly entrenched in U.S. hands—a stronghold in the nation's Pacific outposts. The great naval battle of Midway (*see* World War II), in which the United States defeated an invading Japanese fleet, was fought in the vicinity of the island June 4–6, 1942. During the early stages of the engagement, Midway was bombed by enemy planes.

In view of the intimate connection of these island areas with the conflict in the Pacific, it is not practicable to supply up-to-date information because any accurate information would reflect military secrets.

Mikell, Henry Judah (1873–1942), U.S. bishop, was born Aug. 4 at Sumter, S.C. A graduate of the University of the South, 1895, he received his D.D. degree from the University of Nashville in 1910. He was ordained priest in 1899, served as rector in Charleston, 1899–1908, and in Nashville, Tenn., 1908–1917. In 1917, he was consecrated as bishop and served in the Episcopal diocese of Atlanta, Ga. From 1930 to 1936, he was president of the Fourth Province of the Episcopal church. He died in Atlanta, Feb. 20.

Mikhailovitch, Draja (1893–), Yugoslav army officer, was born in Shumadija, a village near Belgrade. He fought in the Balkan War, 1912–13, and in World War I. He saw action on the Salonika front, was thrice wounded, decorated for bravery and was promoted to a captaincy. He then attended the higher military academy and the general staff school. After the swift nazi conquest of Yugoslavia in April 1941, Mikhailovitch fled to the mountains, where he rounded up scattered Yugoslav detachments and welded them into a powerful guerrilla force. This army destroyed bridges and roads, dynamited trains and troop convoys and compelled the Germans and Italians to divert at least 10 divisions to Yugoslavia. In Jan. 1942 Mikhailovitch was named war minister by the Yugoslav government-in-exile. In the late fall of 1942 it was rumoured that he had "sold out" to the Italians and that the great majority of his force of 200,000 Chetniks had joined a partisan army commanded by a Croat peasant, Kosta Nagy. On Dec. 11, 1942, the Yugoslav government in London denied these rumours, declaring they were inspired to break up Yugoslav solidarity and said Mikhailovitch was "just as powerful as ever."

Milk. Although production of 140,000,000,000 gal. of milk in the United States was announced as needed in 1943 to supply the requirements for domestic consumption and military and lend-lease shipments, the government placed the goal of production for 1943 at 122,000,000,000 gal., only 2,000,000,000 gal. more than the 1942 production. Government authorities urged and hoped for a still larger increase, but pointed out that statistics did not indicate a greater milk flow in 1943 than the goal stated. Cows on farms in 1942 numbered 26,000,000.

Based on the number of cows slaughtered during the year and reports of the number of two-year-old heifers on farms, the milking herds might approximate a 2% increase in number. If such reports were correct and production of milk per cow could be maintained at the 1941–42 level (4,750 lb.), the goal of 122,0 000,000 gal. for the year 1943 might be reached, the governm indicated. It added that hope for larger production depende better care and feeding and that there were abundant supplie high protein feed for this purpose. Scarcity of farm labou some areas, particularly in the northeast and on the Pacific c were a deterrent to increase in production.

Especially noticeable in 1942 was the rapid increase in d milk in overseas shipments because of ship losses from sub rines. When lend-lease shipments first assumed large volume portions, manufacturers of evaporated milk were urged to incr production greatly. Butter was not in demand for lend-lease plies, and it was urged that creameries be converted to the ma facture of evaporated milk. After the U.S. entry into World II augmented need for shipping and further losses from sub rines led to the supplanting of evaporated milk by dried m because dried milk occupies less cargo space. The evapor milk industry increased production to an all-time peak out and the government continued to buy large quantities. By 1942, the Evaporated Milk association reported, the governm had accumulated approximately 25,000,000 cases (48 cans to case), valued at $80,000,000. Later in 1942 the government leased 2,000,000 cases when shortages of fresh milk devel with the seasonal decline in the milk flow. At the beginnin 1943 the government held 17,000,000 cases. (*See* also But Cheese; Dairying.) (S. O. R

Millard, Thomas Franklin Fairfax (1868–1942), journalist, was July 8 in Phelps county, Mo. After working as a reporter in Louis, 1895–97, he was taken on the *New York Herald* staff foreign correspondent. Subsequently, he covered the Gra Turkish War, the Boer War, the Spanish-American War, Boxer Rebellion, the Russo-Japanese War, World War I and Sino-Japanese War. He founded the *Daily China Press* in the first U.S. newspaper in Shanghai, and also founded the *C Weekly Review,* a periodical. Despite his criticism of Chi officials, he was held in high esteem by Chinese autho and acted as unofficial adviser to the Chinese delegation at Versailles conference in 1919. He returned to the United S in 1941, after his editorial attacks on Japan led the Nippone regard him as their public enemy No. 1 in Shanghai. He die Seattle, Wash., Sept. 8.

Miller, Alice Duer (1874–1942), U.S. novelist and was born July 28 in New York While studying at Barnard college, she earned her tuition by ing for magazines. An active suffragist, she was one of founders and first president of the New York Women's City Her early novels were modelled on serious lines, but she turned to light romance. Her most popular work, *The W Cliffs* (1941), a short novel in verse, enjoyed immense popul in the United States, Canada, England and South America. A her other works are: *Are Women People?* (1915), *Are Pa People?* (1925), *The Springboard,* a play (1927), *Forsakin Others,* verse (1930), *Gowns by Roberta* and *Come Out o Pantry* (1933), *Death Sentence* (1934), *The Rising Star* (and *I Have Loved England* (1941). She died in New York Aug. 22.

OTES: A figure in parentheses is for 1940, 1941 data not being available; one in brackets is for a preceding year, 1939, or the latest available. A figure without decimals is an iate, except with cadmium, mercury, potash and pyrite. The letter "p" indicates a production unknown or smaller than the minimum base of the table, while "P" indicates an ut of greater size.

rude magnesite. [2] K_2O equivalent of salts produced. [3] Mainly crude sulphur, but includes some ore, where sulphur content is not reported; also includes some sulphur vered from industrial gases, especially from the roasting of sulphide ores. [4] 60% WO_3 basis.

layed, it was difficult to contrive a single table which could give an adequate idea of the situation; working on the theory that if one could not have current figures, the next best thing was to have those of the immediate past, the first of the accompanying tables (page 447) gives, so far as data were found, the production of the leading minerals and metals in most of the producing countries in 1941; where 1941 figures were lacking, those for 1940 were inserted; lacking these, the 1939 figures were used.

As to current developments in general, the *Mineral Industry* index of aggregate world mineral production rose to a new high of approximately 163 in 1941, from 159 in 1940, 152 in 1939, 139 in 1938, and the former high of 150 in 1937; in comparison with these figures, the 1929 peak was 136, and that of World War I in 1917 was 88, which also was the low point reached in 1933, at the nadir of the depression years.

The second of the accompanying tables (above) shows the opening and closing quotations for the leading metals and ores on the New York and London markets in 1942. With most prices under governmental control and with only advances to be expected in others, the practice of showing high and low points for the year was dropped. The *Engineering and Mining Journal* index of nonferrous metal prices rose from 85.39 in Jan. 1942 to 88.74 in September to December, with an average of 86.80 for the year, as compared with an average of 83.49 in 1941, 79.22 in 1940, and 77.71 in 1939. (G. A. Ro.)

Mineralogy.

The methods and instruments used in mineralogy were discussed in 1942 by Wright in his address as president of the Mineralogical Society of America (*American Mineralogist,* March). Two new minerals were reported during the year: Rankinite, tricalcium disilicate, by Till (*Mineralogical Magazine,* March) and sampleite, hydrated chlo phosphate of sodium, calcium and copper, by Hurlbut (*Americ Mineralogist,* Aug.). In a most interesting article Tomkei traced the origin of the name "quartz" to "querkluftertz" (cro vein-ore), which was probably contracted to "querertz," then "quertz," and eventually to "quarz" in German, "quarzum" Latin, and "quartz" in English (*Mineralogical Magazine,* Marc During 1942 the excellent *Optical Mineralogy* by Rogers and K was issued as the second edition of *Thin-Section Mineralogy* the same authors; and a new text *Elements of Mineralogy* Winchell was published.

Gem Minerals.—An extremely important contribution knowledge of the uses of the diamond as a gem and for industr purposes was the series of eight articles under the caption "Sy posium on Diamonds" (*American Mineralogist,* March), as f lows: "General Statement," by Kraus; "Diamond Productio by Ball; "Cutting of Gem Diamonds," by Kaplan; "Diamonds the Wire-drawing Industry," by Herz; "Diamond Dies in t National Defense Program," by Shayne; "Diamond-set Tools," Slawson; "Bonded Diamond Wheels," by Klein; and "Evaluati Criteria," by Berman. Other noteworthy publications of 19 included: "Investigation of the Minor Elements in Diamond," Chesley (*ibid,* Jan.); "American Synthetic Emerald," by Rog and Sperisen (*ibid,* Nov.); "Causes of Colour in Gem-Stone by Anderson (*Gemmologist,* London, Jan., Feb., March) and Wade (*ibid,* April, May); "The Diamond Industry," by B (*Jewelers' Circular-Keystone*); and the following books: *D mond and Gem Stone Industrial Production,* by Grodzinski (L don); *Gem Testing for Jewellers,* by Anderson (London); *Secr* *he Diamond,* by Monnickendam (London). During the year Linde Air Products company completed its plant at East Chi- , Ind., for the manufacture of synthetic sapphires and rubies, ntial for use as watch jewels and bearings in precision electri- and physical instruments, and production on a relatively large e was begun.

iature Photography: *see* PHOTOGRAPHY.

inesota. A north central state of the United States, popularly known as the "Gopher state." Area, 84,068 i., of which 4,059 are water. Pop. (1940) 2,792,300. The l population was 50·2% of the total. Capital, St. Paul (287,- . The only city in the state with a larger population was neapolis (492,370); Duluth had 101,065.

istory.—Officers of the state in 1941, re-elected in 1942, : governor, Harold E. Stassen; secretary of state, Mike n; treasurer, Julius A. Schmahl; auditor, Stafford King; at- ey general, J. A. A. Burnquist; and chief justice, Henry M. agher. The entire Republican state ticket carried the elections. Thye, whom Stassen selected as his running mate, was elected ucceed C. Elmer Anderson as lieutenant governor. Special est centred in Thye's election, because Governor Stassen had unced before the primaries that, if re-elected, he would resign nter active service in the navy when the state legislature ad- ned; thus the lieutenant governor would be his successor. ph H. Ball, who had held office under gubernatorial appoint- t, was elected United States senator by a large majority, and ur E. Nelson was chosen to fill the short-term vacancy.

e dominant note in Minnesota was war—mobilization of in- ry, intensified mining, accelerated agriculture, bond sales, campaigns, the development of munitions plants, and the rture of men for the armed forces as manpower was mobilized.

ducation.—In 1941–42, Minnesota had 8,278 elementary, secondary and 440 consolidated schools; also 13 junior col- . Enrolment was 316,695 with 12,956 teachers in the ele- tary grades; 187,612 with 8,344 teachers in the secondary es; 2,570 with 172 teachers in junior colleges; 10,163 in t-education classes with 188 teachers; and 465 in teacher ing departments with 34 teachers. The total public school nditure for 1941–42 was $53,674,181.

ublic Welfare, Charities and Correction.—During the ending June 30, 1942, $6,088,856 was spent on general re- the average number of cases being 22,053; on old-age assist- , $16,659,938, the average number of recipients being 63,420. tal of $3,826,455 was spent on dependent children; this sum d for an average of 9,211 families and 21,929 children. An age of 1,006 persons received $325,545 as aid to the blind. WPA employed 25,774 persons; total expenditures were 252,520, of which $10,611,664 represented contributions by sors. For the same period, the state prison, two state reforma- s, and two training schools for delinquents, had a total of 8 inmates, and an aggregate expense of $4,674,046. Unem- ment compensation paid out was $5,600,000 in 1942, a drop 0.9% from 1941.

ommunication.—Highway mileage totalled 11,267 mi. at end of 1942. Railway mileage was 9,097. During the fiscal nium 1940–42, 51 new bridges were constructed in the state, cost of $3,130,000.

anking and Finance.—On July 1, 1942, there were 486 state s, one mutual savings bank and four trust companies in nesota with deposits of $371,639,689; 186 national banks with sits of $919,648,000 and resources of $1,009,385,000; 44 building and loan associations with resources of $36,216,314. The state revenue fund and expenditure for the year ending June 30, 1942, were as follows: receipts, $34,711,745, plus transfers, warrants cancelled, and cash balances, making an available total of $56,451,967; payments, $45,686,602, plus transfers, making a total of $53,637,299; balance, $3,286,175. The unpaid bonds and certificates of indebtedness on June 30, 1942, totalled $106,064,553, a reduction in one year of nearly $13,000,000.

Leading Agricultural Products of Minnesota, 1942 and 1941

Barley, bu.	48,865,000	44,604,000
Wheat, all, bu.	26,504,000	20,506,000
Potatoes, bu.	19,350,000	17,200,000
Flaxseed, bu.	17,260,000	14,858,000
Tame hay, tons	5,553,000	5,453,000
Rye, bu.	4,572,000	3,540,000

Agriculture.—Minnesota enjoyed its greatest agricultural year in 1942, with a gross cash income from the sale of agricultural products and physical volumes of sales by the farmers the largest on record. The total sale of the 19 principal agricultural products of Minnesota approximated $650,000,000, as compared with $480,000,000 in 1941, or an average of $311,000,000 for the five-year period, 1935–39.

Manufacturing.—Official figures later than 1939 were not available in 1942. According to the U.S. biennial census of manufacturers, principal industries were as follows in 1939: meat packing $198,124,044; butter making $78,029,290; flour and grain milling $67,437,432; liquor manufacturing (malt) $23,364,854; printing and publishing (newspaper and periodical) $21,964,698; making of bread and other bakery products $21,349,382.

Mineral Production.—The 1942 output of iron ore in Minnesota was estimated at about 74,309,252 tons, in the longest and heaviest season in Lake Superior ore shipments, extending from March 26 to Dec. 7. The production of coke in 1941 was estimated at $5,082,787.

(T. C. B.)

Minnesota, University of. An institution of higher education at Minneapolis, Minn. A drop in enrolment for the second consecutive year was experienced in the fall quarter, 1942. The decline was 13.4% over the corresponding period in 1941, which had been, in turn, 10.5% below 1940. An accelerated program began in the 1942 summer session, in which 25% of the students from the previous academic year were enrolled. During 1942 the university provided instruction, physical training facilities, medical services, social and cultural opportunities, housing and meals for trainees in several branches of the armed services, turning over three entire buildings in addition to classrooms and laboratories in other buildings for such purposes. This training of enlisted men was in addition to such regular campus student programs as the army and navy reserve officers' training corps, and the various enlisted reserve corps in which many students were enrolled. An increasing number of staff members were carrying on secret war-related research projects. Staff members on leave for service in the armed forces or for other war-related work totalled 407 on Nov. 1, 1942. During the year Walter C. Coffey was promoted from acting president to president.

For statistics of the university, *see* UNIVERSITIES AND COLLEGES.

Mississippi. A southern state of the U.S.A., admitted to the union in 1817, popularly known as the "Magnolia state"; area, 47,716 sq.mi.; pop. (1940), 2,183,796; capital, Jackson (62,107). Other cities: Biloxi (17,475); Greenville (20,892); Gulfport (15,195); Hattiesburg (21,026); Laurel (20,598); Meridian (35,481); Natchez (15,296); Vicksburg (24,460). Of the state's population in 1940, 432,882 were urban, or 19.8%. In 1940 there were 1,106,327 whites; 1,074,578 Negroes; 2,177,324 native born; 6,472 foreign.

History.—The constitution of 1890 was amended in 1942 to provide for a constitutional board of trustees for institutions of higher learning and in reference to the sale and lease of 16th section lands. The chief accomplishments of the legislative session of 1942 were slightly decreased tax rates, increased support for pensions and education, provision for a compilation of the general statutes of the state, and the establishment of a reformatory for Negro juveniles, a board of pardons, a state civilian defense council, and a vocational school for the adult blind.

For 1940–44 the elected officers of the state were: governor, Paul B. Johnson; lieutenant governor, Dennis Murphree; secretary of state, Walker Wood; attorney-general, Greek L. Rice; state tax collector, Carl N. Craig; state treasurer, Lewis S. May; superintendent of education, J. S. Vandiver; state auditor, J. M. Causey.

Education.—In 1942 there were 1,355 white elementary schools and 3,637 Negro elementary schools, or a total of 4,992. Enrolment in elementary schools in 1941–42 was 238,090 whites and 287,139 Negroes. The state had 524 white high schools and 100 Negro high schools. Enrolment in high schools was 62,864 whites and 12,495 Negroes.

Public Welfare.—In 1942 approximately 300,000 workers in the state were covered by unemployment insurance. Benefits paid to unemployed in 1942 amounted to $1,582,631. The Work Projects administration employment average per month during 1942 was approximately 13,500; its total expenditures for the year were approximately $10,000,000.

Communications.—The state maintained 6,266.6 mi. of highways and the counties, 54,405.9 mi. in 1942. Total state expenditure for highways in 1941 was $15,599,780; the total county expenditure was $19,668,721. The total mileage of railroads in the state on Dec. 31, 1942, was 3,937.39 mi.

Banking and Finance.—On Dec. 31, 1942 there were 178 state banks, 22 branch banks, 23 branch offices and 24 national banks. The resources of the state banks were $283,433,557.58 and deposits were $262,186,370.82; the resources of the national banks were $135,551,751.84 and deposits were $126,686,634.01. The total state receipts for the biennium 1940–42 were $98,044,606.28 and total expenditures were $90,603,979.07. On June 30, 1942 the general fund debt of the state was $24,998,000; outstanding highway bonds amounted to $54,421,000, or a total state debt of $79,419,000.

Agriculture.—There were 291,092 farms covering 19,156, ac. in 1941, with a crop output of $212,159,000, of which $1 140,250 was cotton and $29,550,912 was cotton seed.

Manufacturing.—The value of manufactures in the state 1937 was $190,670,510; in 1939 (the last federal biennial cen as of 1942), $174,937,294. The number of persons employed 1937 was 49,246; in 1939, 50,014. The wages paid in 1 amounted to $32,091,639; in 1939, $34,083,646.

Mineral Production.—The total value of mineral product in Mississippi in 1939 was $5,192,156; in the preceding yea was $5,209,547. Since 1939, 48,726,357 bbl. of petroleum been produced, of which 28,616,509 bbl. were produced from wells in 1942. The production of natural gas declined consid ably in 1942. (W. D. McC.

Missouri. A west north central state of the U.S.A., admit to the union in 1821; popularly known as the "Sh Me" state. Area, 69,270 sq.mi.; pop. (1940), 3,784,664 (51· urban). Capital, Jefferson City (24,268). Largest cities: St. Lo (816,048), Kansas City (399,178), St. Joseph (75,711), Spri field (61,238). Aliens (1940) numbered 42,049.

History.—In the election on Nov. 3, 1942, the Republic made substantial gains in Missouri. Eight Republicans and Democrats were elected to the national house of representativ the Republicans gained five seats, a larger Republican gain t in any other state. Eighteen Democrats and 16 Republicans w elected to the state senate (a Republican gain of ten seats), 95 Republicans and 55 Democrats to the state house of rep sentatives (the first Republican majority since the election 1928). The voters approved three constitutional amendme one to increase the pay of members of the legislature; but t rejected an amendment to repeal the nonpartisan court ame ment adopted in 1940. They also approved a proposal to ca convention to revise the state constitution.

During a special session of the Missouri general assem (Nov. 4–28, 1942) Governor Donnell asked for appropriati of about $2,536,020, to provide additional funds for state partments and institutions for the remainder of 1942. Howe the legislature appropriated $5,203,469, adding funds for d ciencies previously incurred by some of these agencies. Don maintained that, despite the practices of previous legislatu appropriations for such deficiencies were unconstitutional. therefore vetoed these items and approved appropriations amou ing to only $2,335,653.

The major state officers (1942), all Democrats except the publican governor, were: Forrest C. Donnell, governor; Frank Harris, lieutenant governor; Dwight H. Brown, secretary state; Forrest Smith, auditor; Wilson Bell, treasurer; Roy McKittrick, attorney general.

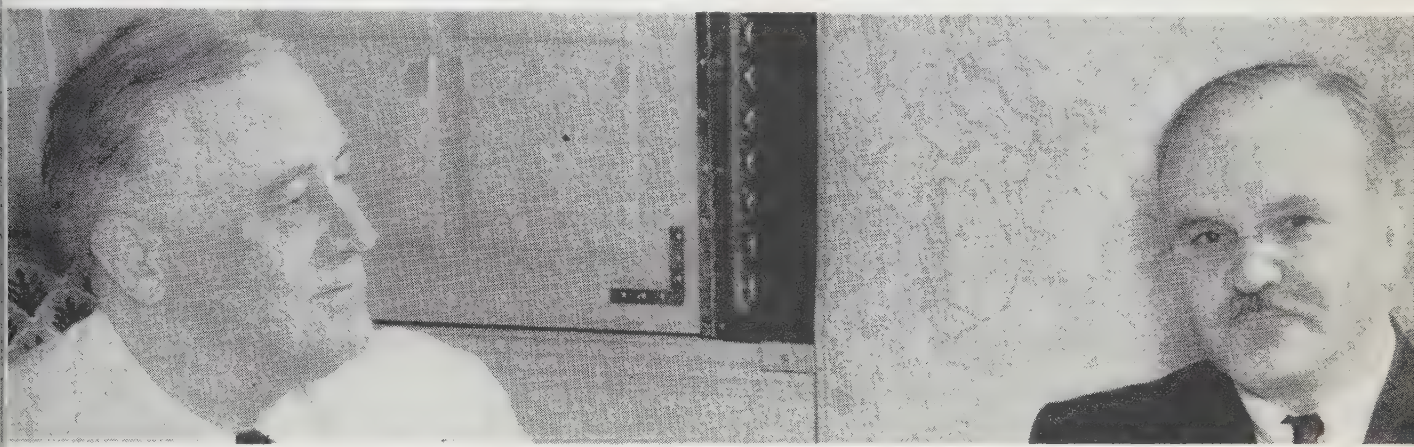
Education.—For the school year ending June 30, 1942, public school system consisted of 8,983 elementary schools, w 505,159 pupils and 17,987 teachers; 987 secondary schools, w 193,138 pupils and 8,208 teachers; 2 state universities (wh and Negro); 5 state teachers' colleges; schools for the deaf blind; and a Negro vocational school. In the same year elem tary parochial and private schools had 63,803 pupils, 1, teachers; secondary schools, 13,351 pupils, 767 teachers.

Public Welfare, Charities, Correction.—For the year e ing June 30, 1942, unemployment compensation totalled $8,0 066, and the government employment services made 216, placements. For the same period WPA earnings amounted $24,700,833; old-age assistance, $18,195,425; aid to depend children, $3,953,827; general relief, $2,764,491; blind pensi $1,016,357 In June 1942, 115,501 persons received old-age stance; 34,214, general relief; 32,339, aid to dependent children; 4,740, WPA earnings; 3,100, blind pensions. In 1940 Missouri aintained 5 penal and correctional institutions; on Dec. 31, 940, the state penitentiary had 3,728 inmates.

Communications.—On Dec. 31, 1941, Missouri had 16,084 i. of state highways and 101,080 mi. of rural roads. During 1941 e state highway department spent $32,539,407 (state and federal nds), of which $13,147,792 was for construction, and $5,895,551 r maintenance. In 1941 railroad mileage totalled 7,042 mi.

Banking and Finance.—On June 30, 1942, Missouri had 530 ate banks, with deposits of $862,213,000 and resources (loans d investments) of $802,909,000; 84 national banks, with deposits of $591,574,000 and resources (loans and investments) of 92,507,000; 194 building and loan associations, with resources $139,245,697.

Total receipts of the state treasury during 1942 amounted to 11,791,871; disbursements for 1942, $101,033,200; gross state bt, Jan. 1, 1942, $89,751,000; net state debt, Dec. 31, 1942, 3,008,000.



ACHESLAV MOLOTOV and President Roosevelt at the White House during soviet foreign commissar's visit to the United States May 29-June 4, 1942

Agriculture.—The value of Missouri's 1942 crops, harvested om 12,408,250 ac., was estimated at $294,965,000, an increase of % over the value of 1941. Unfavourable weather made the winter eat crop the smallest in many years, but the 1942 production of ts and tame hay was the largest on record. In 1942 Missouri's sh income from crops and livestock was estimated at $540,000,o; federal government payments amounted to $22,000,000.

Table I.—*Leading Agricultural Products of Missouri, 1942 and 1941*

Crop	1942	1941
orn, bu.	146,899,000	113,216,000
otton, bales	425,000	476,000

(R. P. Br.)

Mohammedanism: *see* ISLAM.

Molotov, Vyacheslav Mikhailovich

(1890–), Russian statesman, was educated at Petersburg polytechnic and during his youth organized bolshevik student groups and worked for the newspaper *Pravda*. February of 1917 found him a member of the Petrograd soviet executive committee. In 1920 he was appointed secretary of the central committee of the communist party of the Ukraine, and in the following year he held this office for the whole of the U.S.S.R. He was appointed president of the Soviet of People's Commissars in 1930 and was named foreign commissar May 3, 1939, to succeed Maxim Litvinov. The latter appointment foreshadowed the temporary shift in soviet foreign policy which led to the nazi-soviet pact of nonaggression, signed by Molotov in Moscow, Aug. 24, 1939.

On May 6, 1941, Molotov resigned as premier of the U.S.S.R. and was succeeded in this office by Stalin; he remained as foreign commissar, however, and took over the vice-premiership. Six hours after the German invasion started on June 22, Molotov denounced the attack and predicted that the U.S.S.R. would administer a "crushing blow" to its enemy. On July 1 Stalin named him vice-chairman of the soviet defense committee, to which was delegated the full authority of state. On July 13 Molotov signed the British-U.S.S.R. mutual-aid pact in which each nation agreed not to make a separate peace. In the spring of 1942, Molotov went to England and on May 26 he and Anthony Eden signed a 20-year Russo-British mutual assistance pact. Under this treaty, both countries agreed not to sign a separate peace with Germany and not to seek territorial aggrandizement; both also pledged postwar co-operation to preserve peace. Molotov then flew to Washington where, after conferences from May 29 to June 4, he and President Roosevelt signed a lend-lease agreement providing mutual defense aid and reached an understanding "on the urgent tasks of creating a second front in Europe." In August, Molotov was named vice-chairman of the people's council of commissars.

Molybdenum. The output of molybdenum in the United States increased from 34,313,000 lb. in 1940 to an estimated 40,500,000 lb. in 1941, the major producer being the Climax mine in Colorado, which also supplied most of the increase. Although a considerable proportion of the output is a by-product recovered from copper ores, the amount thus obtained is determined by the copper output; since the copper output was near its maximum in 1940, there was correspondingly little increase in the recovery of by-product molybdenum in 1941. The production rate at the end of 1941 was in excess of 46,000,000 lb. a year, and subsequent increases in plant capacity still further benefit the 1942 output. Production was practically on a level with demand during 1941, and declines in stocks were small.

The Mexican production increased from 691,000 lb. in 1940 to 1,532,000 lb. in 1941, all by-product recovery from copper ore, and similar recovery from Chilean ores amounted to 506,000 lb. There was a small output in Canada, and while statistics are lacking, it is thought that the Peruvian output increased materially over the 450,000 lb. reported in 1940. (G. A. Ro.)

Monaco.

A principality on the Mediterranean coast, bounded on the land side by French (occupied) territory. Area 375 ac. (0.59 sq.mi.); pop. (census 1939), 23,973. Chief towns: Monaco, La Condamine, Monte Carlo; ruler: Prince Louis II; language: French. The chief occupation is catering for visitors, who, before war broke out in 1939, numbered more than 2,000,000 annually.

Monazite.

There was a small output of monazite from the treatment of beach sands in Florida in 1941. Imports into the United States declined from 2,967 short tons (201 tons from Brazil and 2,766 tons from India) in 1940 to 1,557 tons (411 tons from Brazil and 1,146 tons from India) in the first nine months of 1941. (G. A. Ro.)

Monetary Units: *see* EXCHANGE CONTROL AND EXCHANGE RATES.

Mongolia

(INNER AND OUTER). A vast, arid, sparsely populated tableland in northeastern Asia, with several deserts, of which the Gobi is the largest. Mongolia occupies an area of about 1,000,000 sq.mi. It is bounded N. by Siberia, E. by Manchuria ("Manchoukuo"), W. by Sin Kiang (Chinese Turkestan), S. by China. Of these two parts of Mongolia, which were administratively separated from each other in 1921, when Outer Mongolia came under predominant Russian influence, Outer Mongolia (622,744 sq.mi.) is larger in size. But Inner Mongolia (334,100 sq.mi.) is more closely settled, with some industry, agriculture and mining, along with the vast grazing lands which are to be found in all Mongolian regions.

Outer Mongolia.—Population in 1941 (estimated) 850,000. Capital, Ulan Bator (formerly Urga). Pop.: 100,000. This immense region has been for many years almost completely isolated from the outside world, except the soviet union. Red army troops, pursuing the anti-bolshevik forces of Baron Ungern-Sternberg, entered Outer Mongolia in 1921 and co-operated with Mongolian revolutionaries in setting up a so-called People's Revolutionary government, which passed under the closest control from Moscow and accepted soviet "advisers" in military, commercial and technical matters.

Under a constitution which was promulgated in 1924 and was closely modelled on the soviet constitution, although with some allowance for the pastoral, nonindustrial character of the country, Mongolia was organized as a people's republic, power being vested in a representative assembly, the Great Huruldan, which selects from its members a smaller group, the Little Huruldan, for more frequent sessions. The Little Huruldan, in turn, elects a committee of five, which is in charge of current affairs.

One effect of the new regime was to cut off Outer Mongolia
from economic, as well as political relationship with China a
to give the soviet union a monopolistic control of the countr
foreign trade. Exports to countries other than the U.S.S.
which were 69% in 1924–25, declined to 3% in 1928–29 and
zero in 1929–30. Mongol debts to Chinese trading compan
which formerly operated in the country were repudiated, a
these companies were gradually liquidated. Russian financial
visers helped to work out a new currency system, the unit bein
silver coin called the *tugerik,* valued at 90 kopecks.

Most of the wealth of the Mongols has always been rep
sented by their flocks and herds. It is estimated that in Ou
Mongolia there were, in 1942, 1,340,000 horses, 270,000 cam
1,500,000 oxen and 10,600,000 sheep. Harsh measures, desig
to promote the collectivist ownership of cattle, adopted in l
with the drive for collective farming in the U.S.S.R., led to s
eral uprisings and to a considerable migration of wealthier M
gols across the frontier into China between 1929 and 1932. Th
measures were subsequently mitigated, and Mongols fought alo
side soviet troops in resisting attempts of the Japanese to pe
trate the country from Manchuria ("Manchoukuo"). The m
serious of these clashes was at Nomonhan, in 1939, and was
companied by the use of tanks and planes. After the sovi
Japanese non-aggression pact of 1941, the border was quiet.

Wool, bristles and casings are among the most important Ou
Mongolian exports. In return the soviet union sends Mong
oil, chemicals, cement, textiles and other manufactured produ
Trade is financed through the Mongol bank, in which the sov
government owns half the capital. The chief trading organizat
is the Mongol Central Co-operative society. There is an air l
between Verkhne-Udinsk, in Siberia, and Ulan Bator, and a hi
way between Ulan Bator and the Siberian border town
Kyakhta. Northwest of Outer Mongolia is the little soviet p
tectorate of Tannu-Tuva, area 64,000 sq.mi., pop. 65,000, capi
Kysylchoto, with communication with Siberia by way of
Yenisei river.

Inner Mongolia.—Formerly Inner Mongolia was a term cov
ing the three northern Chinese provinces of Chahar, Suiyuan a
Ningsia. The Japanese invasion of North China in 1937 led
the establishment of a new state called Meng-chiang (Federa
Council of the Mongol Border Land), which included Chinese
well as Mongol regions and contains a population roughly e
mated at five to seven millions. The new state was a federation
three governments, all under strong Japanese control, with he
quarters at Hohohoto (the former Suiyuan), Tatung and Kalg

The regime at Hohohoto is of purely Mongol character; Tatu
is the principal town of North Shansi and the centre of a gr
coal region, and Kalgan is an old established trading post a
commercial town northwest of Peking. News about Meng-chia
became increasingly scanty in 1942 as foreigners were forced
by Japanese monopolistic trading practices.

There was reason to believe, however, that its economic c
dition was not flourishing and that Japanese hopes for a la
flow of raw materials from this region had not been realiz
Parts of the country suffered from drought, others from floods
1939, with the result that exports were curbed and relief s
plies had to be sent in. The Meng-chiang yuan is of the sa
nominal value as the Japanese yen (23.45 cents U.S.), and
amount of currency in circulation, which was 12,966,000 yu
in Dec. 1937, was 70,886,000 yuan in July 1940. Meng-chiang
traversed by the Peking-Suiyuan railway. Imports over this r
way were 70,358,000 yuan in the first half of 1939 and 82,347,
yuan in the first half of 1940. Exports over the railway w
64,404,000 yuan in the first half of 1939 and 28,784,000 yuan
the first half of 1940. The principal products of Inner Mong
are coal, iron, furs, opium, cereals and linseed. (W. H. CH.

ntana. A northwestern state of the United States, popularly known as the "Treasure state." Area, 147,138 ni.; pop. (1940): 559,456. The urban population was 211,535 37.8%. Capital, Helena (15,056). Other cities of 10,000 or e were: Butte (37,081); Great Falls (29,928); Billings (23,-); Missoula (18,449); Anaconda (11,004). Of the total ulation there were 540,468 whites, of whom 484,826 were ve-born and 55,642 were foreign-born. The Indian population ıbered 16,841.

listory.—In the general election of 1942 the Republicans ied control of both houses of the state legislature. Mike nsfield (Dem.) and James F. O'Connor (Dem.) were elected resentatives to Congress. James E. Murray (Dem.) was re- ted to the United States senate. Proposed constitutional ndments for changes in the state board of education and for thening the terms of certain county officials from two to four s were voted down by large majorities.

am G. Ford, elected for a four year term in 1940, was the Republican governor since 1920. Other state officials in 2 were Ernest T. Eaton, lieutenant governor; Sam Mitchell, etary of state; John J. Holmes, auditor; R. V. Bottomly, rney general; Elizabeth Ireland, superintendent of public in- ction.

ducation.—There were 1,847 elementary schools in Montana 942, with an enrolment of 72,542 pupils and a teaching staff 3,642. There were 214 high schools with an enrolment of 35 and 1,513 teachers. The total cost of operating these ools was $14,371,107.

ublic Welfare, Charities, Correction.—Through federal and e aid, approximately 25,000 persons received public assistance 942. Grants totalling over $5,000,000 were distributed in 2 as follows (figures in parentheses indicate the average num- of recipients per month): Old age assistance (12,425), $3,- 500; aid to dependent children (6,192), $931,300; aid to ly blind (316), $92,800; general relief (2,230), $445,000; ical care (528), $53,500; hospitalization (346), $176,800; als (52), $39,500. Unemployment compensation benefits lling $1,229,000 were paid to 9,855 persons, an average of 23 per week for 11.11 weeks, or $124.70 per claimant. Cor- ional institutions with their average population and total ex- litures in 1942 were: Montana State prison, 480 inmates, 9,484; State Industrial school, 127 inmates, $68,769; Voca- al School for Girls, 69 inmates, $44,206.

ommunication.—In 1942 the state highway commission ntained 6,563 mi. of highways at a cost of $8,196,442. The way mileage was 5,203. There were 12 designated airports and emergency landing fields, including those used by the forest ice. The number of telephones was estimated at 67,743.

anking and Finance.—There were 111 banks in the state in 2. The 41 national banks had total deposits of $92,321,000 their total assets were $101,396,000. State banks had total ts of $85,918,930 and their total deposits were $77,903,000. re were 19 savings and loan associations, with assets of $13,- ,000. For the fiscal year 1941–42, the net state income was 925,090 and the total expenditures were $35,362,692. The gross debt of the state was $9,001,712 and the net debt, $7,858,809.

Table III.—*Principal Mineral Products of Montana, 1941 and 1940*

Mineral	Value, 1941	Value, 1940
Copper	$29,835,000	$28,564,366
Gold	8,627,500	9,541,070
Silver	8,038,400	8,790,080
Zinc	8,496,800	6,625,962
Lead	2,436,000	2,303,600
	Amount in 1940	Amount in 1939
Coal	2,974,000 tons	2,810,000 tons
Petroleum	6,768,000 bbl.	5,961,000 bbl.

Agriculture.—Favourable weather and rapid expansion of some crops made the year 1942 the best since World War I for Montana farmers. The value of all main crops was $134,177,000, as compared with $100,648,000 in 1941. The cash income from livestock and livestock products was $86,598,000. Government payments were $12,923,000.

Manufacturing.—The total value of products manufactured in Montana in 1939 was $151,885,026 as compared with $176,278,814 in 1937. Persons employed in manufacturing numbered 10,898 in 1939 and were paid salaries and wages amounting to $15,832,241.

Mineral Production.—The 1941 production of gold, silver, copper, lead and zinc in Montana was valued at $57,433,700, an increase of 3% over that of 1940. The lead output was less than in 1940, but owing to the higher price its value was greater.

Crude oil production reached an all-time state record of 8,093,972 bbl. in 1942 as compared with 7,517,560 bbl. in 1941.

(E. E. B.)

Montenegro. A former kingdom in the northwest Balkan peninsula, Montenegro had voted Nov. 25, 1918, its union with Serbia in the then newly formed kingdom of the Serbs, Croats and Slovenes, later Yugoslavia. At that time its area was 5,880 sq.mi. with a population est. on Jan. 1, 1917, at 436,789, all of them Serbs of the Greek Orthodox religion. The capital was Cetinje. The last king was Nicholas I, whose daughter married King Victor Emmanuel III of Italy. The occupation of the people is mainly pastoral and agricultural. As a province within Yugoslavia, Montenegro had an area of 3,733 sq. mi. With the redistribution of Yugoslav administration in 1930, Cetinje became the capital of the Zetska banovina or province. The population of Cetinje according to the census of March 31, 1931 was 6,367.

With the disintegration of Yugoslavia as a result of German aggression in April 1941, the country was occupied by Italians. Its fate had not yet been definitely decided in 1942. The greater part of the coastal zone had been directly incorporated into Italy, while the inland districts in about the same extent in which they existed before 1918 became an autonomous province under Italian supervision. Throughout the year the inhabitants of the Black mountains, a proud and freedom-loving people who had resisted for centuries the pressure of Turkey and kept their independence, refused to submit to the "new order" imposed by the axis. Numerous bands of patriots and partisans, some of them in direct collaboration with the Yugoslav patriot arms of

Mikhailovitch and the partisans, harassed Italian garrisons.

Very little authentic news came from Montenegro, or from other parts of Yugoslavia. Yet it was beyond doubt that the people of Montenegro co-operated with the other Serbs and remained loyal to the Yugoslav government and to the cause of the United Nations. An especially violent encounter was reported late in 1942 when patriot troups surrounded an Italian division near Danilovgrad and took a large number of prisoners. (*See* also CROATIA; DALMATIA; YUGOSLAVIA.) (H. KO.)

Montgomery, Bernard Law

(1887–), British army officer, was born Nov. 16. The son of an Ulster clergyman, he joined the Royal Warwickshire regiment as a second lieutenant in 1908. He fought in France during World War I, was wounded twice and received the distinguished service order. After the war, he was a battalion commander, served in Palestine as division commander and was instructor at the Staff college in Quetta, India, remaining until 1937. A month before the outbreak of World War II, in Aug. 1939, he was appointed to command the third division which went to France with the B.E.F. and helped evacuate his troops from Dunkirk in June 1940. Back home again, he became commander of the fifth corps. After Lt. Gen. Neil M. Ritchie's failure to halt Marshal Rommel's drive into Egypt in June 1942, all Britain clamoured for new leadership. Prime Minister Churchill responded by announcing on Aug. 18, 1942, that Lt. Gen. Montgomery was made commander of the British eighth army in Egypt. On Oct. 23, Montgomery launched an offensive against Rommel; within two weeks Rommel's famed Afrika Korps was in wild retreat. By Dec. 31, Montgomery's forces had advanced more than 1,000 mi., chasing Rommel far beyond El Agheila in Libya.

Montgomery, Lucy Maud

(MRS EWAN MACDONALD) (1874–1942), Canadian author, was born Nov. 30 in Clifton, Prince Edward Island. She attended Prince of Wales college in Charlottetown, P.E.I., and later taught school there. She started writing at an early age; at 12, she won a story contest sponsored by a newspaper. The islanders regarded her with admiration as the "girl who writes stories and poems for magazines and gets paid for it." These rugged folk provided her with the inspiration for her most famous novel, *Anne of Green Gables* (1908), which was translated into many foreign languages. Called by Mark Twain "the sweetest creation of child life yet written," the book was twice adapted for the motion pictures. Among her later works were *Tangled Web* and *Jane of Lantern Hill* (1937), *Anne of Windy Poplars* (1938) and *Anne of Ingleside* (1939). She died in Toronto, April 24.

Montreal.

A city of Quebec, Canada, originally Ville Marie, founded in 1642, is situated on an island at the confluence of the Ottawa and St. Lawrence rivers, approximately 1,000 mi. from the Atlantic ocean and 2,760 mi. from Liverpool. It is at the head of ocean navigation and is the terminus for lake vessels from the Great Lakes. It is served by three canal systems: the St. Lawrence canals (1,230 mi. to the Great Lakes), the eastern United States canals, via the Richelieu river and Lake Champlain (127 mi.) and the Ottawa river canals (119 mi.).

The population of the city proper, according to the census of 1941, was 903,007, and of greater Montreal 1,105,359. At the beginning of 1943, as estimated by Lovell's Directory, it was, for the city of Montreal proper, 1,318,595, and for greater Montreal 1,511,930.

The city of Montreal is governed by a mayor and a council of 99 members, of whom one-third are appointed by public bodies, one-third elected by the property owners and one-thi the citizens generally. The mayor is elected by the citize the whole city. The council appoints from among its mem six councillors to act as an executive committee. Greater Mon is governed by a metropolitan commission, on which the city suburbs are represented, the members being appointed by va municipal councils.

The port of Montreal is the largest in Canada. War condi accelerated its activity in 1939–42, but statistics were una able because of war censorship.

In 1942 building permits were issued for 1,216 new proj having a value of $8,754,120, and for 2,265 repair jobs, ha a value of $2,922,000. Bank deposits (for 11 months ended 30, 1942) were $10,348,909,775, and bank clearings for the period $5,942,047,288. The assessed value of real estate a Dec. 31, 1942 was $1,249,055,000, of which $337,533,000 exempt from taxation. (J. A. MA

Mooney, Thomas J.

(1882–1942), former U.S. la leader, was born in Chicago, Ill. at the age of 15 became an apprentice iron moulder. As a y he worked in many parts of the country, then went on a "cult tour of Europe. He returned home an ardent socialist, joined revolutionary wing of the party and was active in many str particularly in San Francisco, Calif. When a bomb was expl during a San Francisco Preparedness Day parade on July 22, Tom Mooney, then organizer of a city street railway strike, arrested and charged with the crime. He was convicted of degree murder and sentenced to hang, although in his testim he insisted he was innocent. His case became a *cause célèb* international labour circles, and the campaign for his release San Quentin prison continued unabated for 22 years. In President Woodrow Wilson won commutation of Mooney's tence to life imprisonment, but four California governors ref to grant him a pardon or parole. When he was finally pard by Gov. Culbert L. Olson, Jan. 7, 1939, Mooney had to spend last years of his life in a hospital bed. His death followe abdominal operation in San Francisco, Calif., March 6.

Morale, National.

When we speak of an individual's " morale" without a second qualifying jective such as "national" or "military" we mean that h confident of himself; that he is under self-discipline; sure o ability to manage the work in which he is engaged; he is pla by no fear; he is proud of himself and will not, therefore cheap or injurious in relation to his neighbours. His morale s up into a feeling of pride in the best sense of the word.

On the scale of intensity the feeling varies among individ —and in the same individual from occasion to occasion— mildness to delirious excitement. It always involves initiative drive. The man whose morale is high does not hesitate to set upon a program that has been chosen and to follow it through

In its most useful sense morale includes knowing or un standing the essential background of a situation. If this is ing or overwhelmed by intensity of emotion, morale is superf and temporary, but may, nevertheless, as in Germany and Ja have its uses. One may, *e.g.*, ignorant of the odds, fight enth astically unto annihilation.

National morale is the morale of citizens when they ha sense of confidence and pride in the nation; in its past acc plishments; in its possibilities; in its resources; in its hist ideals. Each feels that he is a part of the nation; that its tory, resources and future are his; that he is a member of a others like himself; he participates co-operatively with them . He has, therefore, a sense of personal and national strength. hen citizens generally are in that state they co-operate whole- artedly and they approximate invincibility.

Conditions and agencies that affect national morale positively negatively are too numerous to be mentioned. Morale is af- ted one way or another by every personal experience.

The Committee for National Morale was developed particu- ly for research and public education relating to the essential nditions in which national morale arises. It includes sub-com- tees which suggest the range of its studies. The following is partial list: psychology; psychiatry and neurology; medicine l physiology; radio and motion pictures; education and his- y; journalism and public opinion; foreign affairs; military nce and history; opinion and attitude testing; art and music; eign minorities; social science; national economy; social serv- and civic agencies; American tradition.

The committee, active in two principal directions, completed exposition and bibliography of German literature on psycho- ical warfare. The bibliography includes titles of approximately technical articles and books that were published while the ders of the third reich were consciously preparing for World r II. These works were read and digested by members of the nmittee and the whole was made available in a volume en- ed: *German Psychological Warfare.* It shows the means ereby national and military morale were developed in Ger- ny after the nazi regime came into power.

Secondly, the committee invited many American scholars each contribute a memorandum for the purpose of bringing together nprehensive data and opinions concerning the nature of morale the circumstances in which it may grow. These memoranda ly to general morale factors. Some of them are discussed hout respect to particular situations, and others with reference, example, to the development of morale in an industrial estab- ment. In any case, they contribute to an understanding of ional morale. Interpretations of a few selected memoranda are sented here.

Morale Factors.—1. An integrated, healthy, well balanced per- ality is altogether essential to high morale in any association, ll or great. Psychiatrists and mental hygienists recognize ir role in this connection. The official publication (*Mental giene*) of the National Committee for Mental Hygiene and its letins are fundamental instruments through which the mental giene principle is extended to almost all organized and unor- ized educational activities that touch many millions of people the United States. The principle applies to morale for both out warfare and for peacetime.

single psychically instable member of a unit within an armed e may bring fatal results to the entire unit and more; for h a one is likely to break under prolonged tension or at a ical moment. In that case he becomes a source of mental tagion. Hence, for the military, naval and air services it is neasurably important to select psychically stable personalities to maintain them in that condition. It is thus that psychi- sts and mental hygienists through their organization and indi- ually were active in the selection and training of members of armed forces. In time of peace they are equally active in umbered school, industrial and public clinics. In these rela- ns they seek out and try to eliminate conflicts which render individual unhappy, fearful, inefficient and unreliable in the up or industry in which he is placed.

These interests supply the motif for the programs sponsored the U.S.O. and other organizations in military training camps elsewhere. It is not to provide recreation for its own sake, as a measure for mental health, stability and morale. Wherever men and women are engaged in routine, recreation in form of dancing, art, music, wholesome fun, letters from family and friends, telephone calls, all in addition to the daily news, and religious exercises, too, promote mental health and morale because they distract from irritating monotony and self-interest. It is impossible to estimate the value of radio programs and the screen to the millions lonely and anxious at home and in camp.

The American Red Cross, its services and its publications, contribute importantly to the health and morale of men in the armed forces and war industries, of their families and of great blocks of the population in times of disaster.

The American Social Hygiene association whose organization, official publication (*Journal of Social Hygiene*) and bulletins enter every state and municipality aims ultimately, through propaganda and other educational means at the development of a public morale that will make exposure to venereal diseases improbable. It co-operates with official agencies for the cure of these diseases among the armed forces, industrial workers and in the general population, and for eliminating sources of infection. Innumerable other voluntary organizations aim at the promotion of both physical and mental health directly and by educational means. They lift the morale of millions by giving them hope and courage and the possibility of prideful participation in the world's work.

2. Economic security plays an important role in the development and maintenance of morale. The highest values that men and women cherish can hardly mature when they are nagged daily throughout life by the fear of insecurity. Hence a program for elevating morale justifiably emphasizes thrift and wise investment in property and insurance. For national morale the voluntary purchase of U.S. war bonds was especially appropriate because such purchases associated a step toward economic security with citizenship in the nation.

3. Formal academic education is a national morale builder provided it connotes broad relationships and kindles affective warmth toward the nation. Mere acquaintanceship with facts is of little avail.

4. Numerous devices, created by managers of industry, elevate the workers' loyal pride in the plant, *i.e.*, their industrial morale. These devices exhibit applications of the principle of participation which is essential to institutional, group or national morale everywhere. They include plans whereby workers may invest in the industry, become part owners of it, and therefore, theoretically participants in its management.

An especially interesting scheme for obtaining participation is illustrated in a policy of several well known industrial establishments. Workers were encouraged to submit their suggestions for improving the management of the plant, methods for reaching potential buyers and for economizing in the time and material required for production. Responsible members of the firm studied the suggestions that were offered. They found numerous practical measures, put them into operation, estimated their value and paid royalties to their authors. A proportion of the larger plants, moreover, offer facilities for in-service training and education in relation to technical processes within the plant and to the broad social implications that are involved in industry. The idea is to develop the worker's "feeling of identification with the industry," in other words to attach him as a participant to something great outside himself.

Family morale, likewise, is high or low according to the presence or absence of the participation factor. The family in which parents and children participate in work and in discussion of questions that affect all together; in which no member's identity and initiative are neglected; in such a family are found throughout life the strongest bonds of loyalty and pride. It is so likewise with school, club, church and community morale.

Creating High National Morale.—High national morale requires that all other conditions such as health, economic security, etc. be supplemented by a warm participation in the ideal life of the nation as it is today and historically. It was one of the functions of the federal Office of Civilian Defense to build morale. The Office relied largely upon the principle of co-operation in elaborate locally organized defense programs. Theoretically there was emergency work for every one to do: blacking out on signal; learning to extinguish incendiary bombs, etc. Such participation under the pressure of great public interest and enthusiasm was expected to develop national morale.

But national morale must be substantially developed and maintained on a uniformly high level in peacetime when there is no pressure of emergency. How? Procedure in Germany after 1933 was brought to light by the Committee for National Morale. In *German Psychological Warfare* the committee describes devices that nazi leaders employed to build civilian and military morale. Among other means:

1. They exalted personal strength, prowess and self-discipline. Competition in all sorts of sports was encouraged, not for personal satisfaction, but to make the contestants fit to follow the fuehrer, defend the reich and enlarge its sphere of influence. Illustrations of the heroism of the strong were always at hand.

2. They emphasized by every means, as reason for pride, the imagined superiority of the German race over all others; asserted their invincibility and repeated it, and deduced therefrom that they are destined to rule the world. They never failed to encourage the long look ahead and to assert the German capacity to meet the necessities that had been placed upon them by their foes.

3. They stimulated pride in the material resources and practical accomplishments of the German state.

4. Necessary daily work was glorified as participation in state affairs.

5. They never allowed the people to forget that the state protects them in adversity.

6. By clever propaganda they deified their fuehrer as the representative of all that is great and worthy in German history and of all that the reich is yet to be.

7. They continuously exploited the sacrificial and heroic leaders of the German folk, past and present, in picture, song and biography. Their sacrifices, wounds and death were described as in the very cause for which the present generation is urged to struggle to the bitter end. Thus naturally, the worship of heroes became a devotion to the cause of the state that the heroes stood for.

In soviet Russia the methods of morale building were essentially the same. (*See* also PSYCHOLOGY.)

Mormons. During the year 1942 the welfare program of the Church was further developed. In the farming and stock-raising communities labour shortage became increasingly acute owing to the large numbers in the armed forces of the country, and in defense works of various kinds, farmers and stockmen being unable to harvest crops, plant fall crops, and care for and market their livestock. Dairymen were likewise shorthanded. To meet the situation, priesthood quorums organized "change work" groups to help meet the labour shortage.

Communities were more and more securing and operating, for the benefit of the needy among them, small farm units whic were worked, so far as possible, by those who would requi some assistance in livelihood necessities. The added labou necessary to operate such "projects" was furnished by the vo unteer labour of priesthood members who are not in need.

The scarcity of building materials and priorities curtailed th Church building program. The priesthood activities of the Churc both secular and religious, were intensified. The priesthood— composed of all male members of the Church over 12 years age—were urged to take on and were assuming increased diligen in their service.

The educational program of the Church—absorbing approx mately 20% of the annual budget—was carried on during 194 without any curtailment. All teachers were retained, despite th decrease in student enrolment, and salaries were adjusted upwa to help meet the increased cost of living.

The women of the Church, through their century-old charitab organization, the National Woman's Relief society, were plannin to meet the nursing needs of the people as the doctors an nurses were more and more drained from the communities. I some areas the situation threatened to be serious. (*See* al CHURCH MEMBERSHIP.) (J. R. CL.)

Moscow. Since the beginning of the war with Germany, Mo cow had by the end of 1942 passed through thr different periods. Until Oct. 1941, military operations did n seriously interfere with the life of the city, but in the secon period which began early in Oct. and lasted up to the beginni of Dec. 1941, the German army made a supreme effort to encirc and capture it, and the front line approached as near as 20 m During this period Moscow lived in a state of siege, but Dec. 13, 1941 it was officially announced that the danger of e circlement and capture was definitely removed and that the Ge man army had been forced to retreat. Then began the third peri in the war-time life of Moscow. The front line was thrown ba and in 1942 its nearest point was about 120 mi. away. Some i stitutions as well as part of the evacuated population returned Moscow, but many thousands remained in evacuation areas.

In Oct. 1942 the population of Moscow was 2,800,000, again 4,137,000 in 1939. The chairman of the Moscow Soviet stated that time that during 1942 the schools had opened on time a added "the theatres and cinemas are functioning normally a every citizen lives a full, eager life devoted to the task of servi the Red army." Many Moscow factories, as a result of the achievements in socialist emulation, were awarded Red banners the state defense committee: Mobilized men from factories we aced by women who underwent intensive training in skilled . In 1941 the Germans laid waste the Moscow coal basin but as stated "not only has it been restored, it is turning out veen 25% and 30% more coal than it did before the war. Our er stations, factories and institutions are well stocked with for the coming winter of 1942–43. Tens of thousands of our le have gone out to the forests to cut firewood. They have dy stocked several million cu. feet of timber. Hundreds of els tie up each day at the wharves with loads of timber. We repairing damaged houses and flats and making them thor- ly weathertight. Everybody is helping. Over 2,000 well pped flats have been provided for the families of our Red y men. We have plenty of food stored away. We shall, of se, have to economize, but we shall not starve."

hus was the situation in Moscow on the eve of the winter of –43 officially described. (A. M. Bv.)

tion Pictures.

The motion picture industry in 1942 was "stripped for action," literally as well as atively. Names that spelled money, power and importance in motion picture world joined the armed forces. At the year's more than 4,000 of those directly concerned with the mak- of pictures were in uniform, including producers, directors, , writers, technicians and artisans of all kinds. Close to 900 s were in the service. The total represented 22% of studio personnel.

utstanding names of the industry in the armed forces in- d Gene Autry, Richard Barthelmess, Freddie Bartholomew, e Cabot, Jackie Coogan, Broderick Crawford, Donald Crisp, glas Fairbanks, Jr., Clark Gable, William Haines, Stirling den, Peter Lind Hayes, Louis Hayward, Jeffrey Lynn, Ray- d Massey, Burgess Meredith, Robert Montgomery, Wayne ris, Richard Ney, Gene Raymond, Cesar Romero, Charles ddy) Rogers, James Stewart, Robert Stack, Lee Tracy, Irving r, Darryl F. Zanuck, Eugene Zukor, Frank Capra, George or, John Ford, Garson Kanin, William Keighley, Anatole k, Gene Markey, Hal Roach and Robert Presnell.

dded to this devastating loss of manpower, the motion pic- industry also functioned in an atmosphere of increasing re- s and increasing expenses, of ever-growing demands for its uct and decreasing facilities with which to make its product.

he theatres in 1942 did a tremendous business, but while e was more money coming in there were fewer things which on picture money could buy. Executives who once had cas- added half a million dollars to a picture's budget now ap- d for such unimportant objects as old nails.

e greatest problem was the dearth of leading men. All studios engaged in recruiting masculine talent and acquiring stories could be produced with a minimum of males of military serv- ge.

llywood rose to the occasion and met this challenge by pro- g some of the finest pictures in many years. It is no mean te to Hollywood that in 1942 under these trying conditions was an increase rather than a diminution in the quality of roduct.

e capital investment of the industry in 1942, according to ates of the Motion Picture Producers and Distributors, Inc.,

Theatres	$1,900,000,000
Studios	125,000,000
Distribution	25,000,000
	$2,050,000,000

e Producers and Distributors organization estimated federal s at $160,000,000 in 1941, and state and municipal taxes at ,000,000. According to the most dependable surmises, 1942 federal taxes increased about 30%, and state and municipal taxes about 10%, over the 1941 figures.

ROSALIND RUSSELL, U.S. motion picture actress, at a United Service organizations party in Camp Bowie, Tex., in 1942. Stage and movie stars made innumerable tours of U.S. camps during the year

Weekly attendance figures at motion picture theatres in the United States have long been the subject of widely varying estimates. There is no question that attendance increased greatly in 1942. A conservative attendance estimate was 88,000,000, which probably indicated a 12% increase. In addition, attendance at army camp theatres ran into the millions weekly.

The estimated total box office gross of $1,100,000,000 in 1941 undoubtedly increased materially in 1942. The number of operating theatres rose from 16,951 in 1941 to 17,568 in 1942. Because of war restrictions on building, it is likely that a large part of the increase was accounted for by re-opening of closed houses.

While attendance figures were greatly up in metropolitan areas, especially in war production centres, there was a falling off in rural districts where manpower had been diverted to war work and the armed forces.

In English-speaking countries generally motion picture theatre attendance greatly increased. The foreign market as a whole, because of enemy and occupied countries, had been cut about in half by war.

Because of the constantly shifting scene, it is impossible to estimate with any accuracy the number of persons employed in the industry's exhibition, production and distribution branches. The best guess is that the number of employees in 1942 was down about 10%, probably considerably under 200,000. Because of the drainage of manpower by war, many workers doubled up. Payrolls increased probably 10%. The approximate annual payrolls of the industry had previously been estimated by the Producers and Distributors organization at $322,500,000.

The basic problem of the industry in 1942 was the obtaining of an adequate supply of raw film. Because certain of the chemicals used in its manufacture were vital for war purposes and because of the heavy production of government pictures, such as training films for the armed forces, it was early apparent that the raw film supply for entertainment purposes must be curtailed.

One over-all reduction in film, estimated at 24%, was put into effect during the year. At the end of 1942 a second cut of similar proportions loomed.

Emphasis was placed by producers on "fewer and better" pictures. The death knell of "B"—run-of-mine productions—again was sounded. But "B" pictures were still being made in 1942.

Reduction in raw film supply forced more careful shooting of pictures. Continued retaking of scenes was frowned upon, and the necessity obviated by more careful rehearsing.

Governmental limitation of $5,000 for set construction per picture also called versatility and ingenuity into play. In the old days, stage designers summoned by Hollywood sometimes were dazed to find that elaborate and costly sets were constructed to flash for only a few seconds upon the screen.

In 1942, motion picture artists were reconstructing old sets, and calling upon such substitutes as cloth and paint to "stand in" for the unobtainable solids. The success obtained may fairly be called remarkable.

Adequate substitutes were found for 50 critical materials essential in making motion pictures. Included in the list were substitutes for steel, wrought iron, bronze, brass, copper, zinc, asbestos, rubber and wool. Plaster was rapidly emerging as the all-purpose material.

To a certain extent, pictures were driven out-of-doors and often far afield to make up for the production values reduced by lack of materials. Hollywood being in a defense area, there were restrictions upon outdoor shooting. The deserts and mountains of the near interior were increasingly called upon. Yet, to accomplish this, the studios had to meet new transportation problems, brought about by rubber and gasoline limitations.

In a year of alarms, the prize bomb dropped upon the Hollywood scene undoubtedly was the $25,000 a year wage ceiling. Aside from the upheavals in the lives of high-salaried personnel, this made it doubtful how much work could be done by players in pictures and in the neighbouring field of radio, and also left the provisions of players' contracts in a hazy state. At the year's end, there was a hope of amelioration, but the situation had not yet been completely clarified.

The government had early indicated its belief in the power of motion pictures in sustaining democratic ideals and contributing to the morale of both the public and the armed forces. There was much discussion over the advisability of having motion pict declared an essential industry. At the first suggestion, howe of a deferred classification in selective service, the Screen Ac guild went on record in opposition.

Under these conditions, the manpower problem grew prog sively more acute. It was felt not only in the so-called ta classifications, but even more sharply in the technical dep ments. Thirteen branches, however, at the close of 1942 declared essential to the war effort.

Early in the conflict, in a letter to Lowell Mellett, now c of the Bureau of Motion Pictures, Office of War Informa President Franklin D. Roosevelt had said:

> The American motion picture is one of our most effective media i forming and entertaining our citizens. The motion picture must remain in so far as national security will permit. I want no censorship of motion picture; I want no restrictions placed thereon which will impai usefulness of the film other than those very necessary restrictions which dictates of safety make imperative.

Speaking broadly, the war censorship of motion pictures m be compared briefly to that exercised upon the press. In waning days of 1942, however, a flurry was caused by a le from Mellett to studio heads requesting submission of all sc before production, as "this will enable us to make suggestion to the war content of motion pictures at a stage when it is and inexpensive to make changes which may be recommended

New feature pictures approved by the Production Code ad istration of the industry in 1942 were: domestic, 521 (194 546); foreign, 30 (1941—22).

There was almost a complete lack of the obvious heavy-ha propaganda pictures of World War I. The 1942 war pict were more artistic and subtle and therefore more plausible effective. *Mrs. Miniver* and *The Pied Piper* were good ex ples of the new approach. From many regions came report sharp increases in enlistments after good war pictures had shown.

Projects initiated by the government to rally the nation be the war effort found vigorous industry support. Productio training films for the services was undertaken even before Harbor. These proved so helpful that, at the year's end, al 2,000 reels of such film were completed.

Defense and documentary films also were being turned o a steady stream to give quick and emphatic presentation of p which the government considered vital in the prosecution of war.

The industry also gave liberally of its time and talent in s ulating the sale of war bonds through personal appearances appeals of its outstanding figures. The major over-all gr called the War Activities committee, alone carried through a paign which resulted in the sale of $1,000,000,000 in war bo The same committee arranged for the production, distribution showing in 15,000 theatres of the various government shorts trailers.

Somewhat more publicized was the work of the Hollyw Victory committee, organized three days after Pearl Harbor a membership of 100, among them 48 of the screen's top stars

The most spectacular achievement was the "Stars Over A ica" campaign in September. The stars appeared in 300 Amer cities and raised a total of $838,250,000. Highly successful, was the Hollywood Victory Caravan, composed of 32 stars. T toured 12 cities to raise funds for the Navy Relief society the Army Emergency Relief. The Caravan shattered all kn attendance and box office records in the history of entertainm

The industry also sent more than 1,100 of its players to ous camps and military establishments both in the U.S. abroad. They travelled in excess of 1,000,000 mi. during the to participate in 6,828 appearances and 222 radio programs nating from camps.

HER PART in *Mrs. Miniver,* Greer Garson was awarded the 1942 Academy as best actress of the year. She is shown here with Walter Pidgeon

RUTH AND GARY COOPER in *Pride of the Yankees,* a motion picture based he life of Lou Gehrig, famous New York Yankees first baseman, whose part r plays

S CAGNEY and Frances Langford in *Yankee Doodle Dandy.* Cagney received 942 Academy award as the best motion picture actor of the year

SPENCER TRACY AND KATHARINE HEPBURN in *Woman of the Year,* voted the best original screen play of 1942 by the Academy of Motion Picture Arts and Sciences

VAN HEFLIN (left) and Robert Taylor in *Johnny Eager.* Heflin's role in this picture won him a 1942 Academy award for best supporting actor

SCENE from *The Pied Piper,* starring Anne Baxter (left) and Monty Woolley (right centre)

Direct financial contributions of the industry were heavy:

The plan under which 10% of each person's salary automatically is deducted at the source for the purchase of war bonds was originated in Hollywood. By December, under this arrangement, the studio workers were buying $300,000 in war bonds weekly.

Various public charities, such as the Community Chest, Red Cross, Russian, Chinese, Dutch and Navy Relief, received a total of $1,829,424.06 in contributions from the industry.

As its pet contribution to morale building among the armed forces, the industry established its own Hollywood Canteen. It immediately became a great success. All food and entertainment was free, but the chief attractions for the men in uniform were the stars serving as hostesses, dancing partners and waitresses.

Awards.—Academy of Motion Picture Arts and Sciences Awards for 1941 (for the principal 1942 awards see p. 459):

Irving Thalberg award, for most consistent high quality production achievement by an individual producer, Walt Disney; outstanding picture, *How Green Was My Valley,* Twentieth Century-Fox; performances—actor, Gary Cooper in *Sergeant York,* Warner Bros.; actress, Joan Fontaine in *Suspicion,* RKO; supporting actor, Donald Crisp in *How Green Was My Valley;* supporting actress, Mary Astor in *The Great Lie,* Warner Bros.; best direction, John Ford for *How Green Was My Valley;* best original motion picture story, Harry Segall for *Here Comes Mr. Jordan,* Columbia; best written screen play, Sidney Buchman and Seton I. Miller for *Here Comes Mr. Jordan;* best cinematography—black and white, Arthur Miller for *How Green Was My Valley;* colour, Ernest Palmer and Ray Rennahan for *Blood and Sand,* Twentieth Century-Fox; best film editing, William Holmes for *Sergeant York;* best art direction—black and white, Richard Day and Nathan Juran for *How Green Was My Valley;* colour, Cedric Gibbons and Urie McCleary for *Blossoms in the Dust,* Metro-Goldwyn-Mayer; best set decoration—black and white, Thomas Little for *How Green Was My Valley;* colour, Edwin B. Willis for *Blossoms in the Dust;* best sound recording, Jack Whitney for *That Hamilton Woman,* General Service; best scoring of musical pictures, Frank Churchill and Oliver Wallace for *Dumbo,* Walt Disney; best scoring of dramatic pictures, Bernard Herrmann for *All That Money Can Buy,* RKO; best song, Jerome Kern for music and Oscar Hammerstein II for lyrics for *The Last Time I Saw Paris,* from *Lady Be Good,* Metro-Goldwyn-Mayer; special effects, Fariot Edouart and Gordon Jennings for photography and Louis Mesenkop for sound for *I Wanted Wings,* Paramount; documentaries—short subjects, *Churchill's Island,* Canadian Film Board-United Artists; short subjects—cartoon, *Lend a Paw,* Walt Disney; one-reeler, *Of Pups and Puzzles,* Metro-Goldwyn-Mayer; special awards, Ray Scott for producing *KuKan,* the film record of China's struggle, including its photography with a 16 mm. camera under the most difficult and dangerous conditions; British Ministry of Administration for the documentary film, *Target for Tonight;* Walt Disney, William Garity, John N. A. Hawkins, and Radio Corporation of America for their outstanding contributions to the advancement of the use of sound in motion pictures through the production of *Fantasia;* Leopold Stokowski and his associates for the creation of a new form of visualized music in *Fantasia.*

Outstanding Pictures.—Outstanding pictures of 1942 included: *Mrs. Miniver, Random Harvest, Pied Piper, Yankee Doodle Dandy, Wake Island, My Favorite Blond, Once Upon a Honeymoon, My Sister Eileen, Casablanca, This Gun For Hire, To the Shores of Tripoli, Joe Smith American, Woman of the Year, My Gal Sal, Tortilla Flat, This Above All, Bambi, Holiday Inn, Pride of the Yankees, Talk of the Town, Wings and the Woman, The War Against Mrs. Hadley, Across the Pacific, Now Voyager, The Major and the Minor.*

1941 was a banner year for outstanding films, but even th failed to compare with the war year of 1942. The New Yo critics selected Noel Coward's epic, *In Which We Serve,* as t best picture in 1942. The picture was made in England; a Noel Coward wrote, directed and acted in it.

Outstanding Actors.—The *Motion Picture Herald* in its a nual review listed the ten biggest money-making stars of 194 For the first time in three years, Mickey Rooney lost his positi at the top. The two comedians, Bud Abbott and Lou Costel were listed as the greatest draws at the box office, which was amazing tribute to their personal popularity, for their pictu were not especially outstanding.

The others named in order were: 2. Clark Gable, 3. Ga Cooper, 4. Mickey Rooney, 5. Bob Hope, 6. James Cagne 7. Gene Autry, 8. Betty Grable, 9. Greer Garson, 10. Spenc Tracy. (L. O. P.)

Little new studio and theatre equipment was developed duri 1942 because of the lack of materials and manpower caused the national war effort. Certain projects, the principal work which had been accomplished in previous years, were complet and material conserving techniques were evolved.

Optics.—The evaporative process of applying anti-reflecti coatings on lens surfaces came into more general use on came lenses at Twentieth Century-Fox, Technicolor and Paramou Improvement in transmission of 37% for a six-element lens sembly was experienced. The baked coating is of sufficient ha ness to allow cleaning with lens tissue and benzine.

A limited number of large flat glass surfaces such as projecti port glasses at Twentieth Century-Fox and camera blimp windo were treated by the new RCA Magicote "C" method of applyi anti-reflection coating. This method was the commercializati of the Nicoll acid vapour method of reducing the reflectance glass by exposure to hydrofluoric acid vapour. It was not possi by the close of 1942 to apply this treatment to other than surfaces, but the coating secured was of great durability and method allowed the handling of large glass sheets—a procedu not possible with evaporative methods to date.

Film.—The use of fine grain positive film for release pri continued to gain. Most studios were employing this release m dium. Almost all users of variable density recording also adop fine grain sound negative stocks as standard. RKO, among variable area users, adopted fine grain positive emulsions sound negatives. Essentially all studios were making sound pri on fine grain positive stock.

The problem of maintaining accurate print control with f grain positive emulsions and mercury vapour lamps was solv in the case of the M-G-M laboratory by controlling the la intensity by a feed-back circuit actuated by a photoelectric on which falls a portion of the light from the lamp. This cuit was devised by M-G-M in conjunction with DuPont Hanovia and not only corrects for variations in the light out of the lamp but can be used as a light meter for establishing absolute level of the light required for various types of prints.

Triple head process projectors were widely used by War Brothers, RKO, and Paramount. The Paramount projector a relatively silent machine which could be used without sound absorbent booth. The three projection heads, whose co bined light output approximated 50,000 lumens, were mounted a special base. Each unit could be removed and used on an in vidual base as a conventional single-head process projector. eliminating the need for a separate, permanent triple head u a considerable investment was saved.

Along with this improvement in process projectors, Paramo solved the problem of handling process screens and portable li bridges for top lighting above transparency screens by use ni-monocoque steel frames for these screens and light bridges. he screen frames mounted on caster-equipped elevating jacks for nsportation and elevation to "shooting" position without plat- ms. The bridges, inverted "U" shaped structures, telescoped th vertically and horizontally without the benefit of bottom tie ls. They were particularly useful for straddling sets and could used to support both lights and the process screen if desired.

Wartime restrictions made location work difficult and fostered t only a larger amount of process projection of the motion pic- e type but also greatly increased the use of still background ojectors. Paramount developed and employed a unit consisting a multiple relay optical system in conjunction with a still pro- tor. This equipment supplied approximately $2\frac{1}{2}$ times as much ht as conventional projectors. The increased heat of the light m was selectively attenuated by a water cell which absorbs far infra red and cools a near infra red filter glass thus min- izing plate breakage and emulsion fading.

In addition to conservation of sound film stock by pre-selection "takes," a practice common in many studios, Republic added -selection of picture negative stock. Punches were used to boss the film between scenes, and a careful log was kept dur- the actual shooting. Scenes which were not required could n be identified in the dark room by locating the punch marks, noved from the roll, spliced together, and used as "leader" ck for dubbing masters.

Sound.—A number of studios standardized on a uni-directional crophone which provided a smooth frequency characteristic l reduced rear reflections by approximately 15 DB. This micro- one was mounted in a case designed for relative freedom from d noise caused both by actual wind and by "panning" on a crophone boom. The unit was rugged and had sufficient mass oad suitably conventional microphone boom suspension mounts.

Republic continued to use class B push pull variable area ording for all original production recording and music scoring. s system simplified the equipment by elimination of noise re- tion amplifiers and shutters, simultaneously providing maxi- m noise reduction—an inherent feature of this type of class B nd track.

The RCA three layer dichroic reflector continued in use at entieth Century-Fox and was also introduced at Republic for otocell monitoring of the recording light beam. This reflector, sessing a transmission of 95% at 4,400 angstroms and a re- tivity of 65% at 7,340 angstroms, when placed in the light m of a recording optical system transmits the actinic rays ch expose the film and reflects the deep red rays to a caesium otocell for monitoring purposes.

The electronic mixer or volume compressor used in variable a recording channels was improved in performance by Warner others through the introduction into the control circuit of this t of a spectral energy equalization circuit. This circuit in- ased the action of the compressor at the higher speech and sic frequencies at which high peak powers are encountered of h short duration that insufficient energy exists to suitably uate an unequalized compressor.

A single film recording system developed for the use of the ned forces consisted of a recording sound head capable of being unted on conventional picture cameras in place of the stand- magazine without any mechanical coupling to the camera. ra-violet variable area class B push pull sound track was re- ded directly on picture negative stocks with wide processing rance achieved through the use of larger than conventional ro lines" in the class B optical aperture.

Lighting.—Essentially no new development occurred in light- practice because of the government limitation on critical ma- als for new types of lamps or lighting fixtures. Because of the increased speed of motion picture emulsions, the light intensity continued low and further use was made of control by means of individual dimmers on lamps. Conservation of lamps and carbons employed in arcs was accomplished through rehearsals effected with a minimum of light.

Colour.—Usage increased of the 16 mm. kodachrome to 35 mm. technicolor "blowup" technique, pioneered in 1941 by Warner Brothers. This procedure was used by the United States navy for the release prints of the Battle of Midway.

Technicolor introduced a three-colour single film emulsion, known as Monopack. This film could be used with any standard camera possessing a suitably colour-corrected lens and greatly simplified the making of a technicolor picture negative.

The armed forces recognized the value of colour in combat and training films, since it had been observed in such films that patterns could be recognized and objects identified in less time than with black and white photography.

Theatre Equipment.—There was increased installation by theatres of the Century and Brenkert picture projectors. Universal standardized on the use of Brenkert projectors for studio projection rooms.

RCA introduced to the theatre and studio field a new sound screen known as the "Snow White" screen, which meets the S.M.P.E. requirements for sound transmission and possesses a light distribution characteristic that only varies from 93% reflectivity at the angle of incidence to 75% at 60° from incidence. The reflection factor is essentially constant at 85% at 420 millimicrons. The screen therefore exhibited essentially the characteristics of a matte surface with low spectral discrimination. Cost was approximately one-third that of conventional screens of equal performance. (*See* also PHOTOGRAPHY.) (B. K.)

Motor-Boat Racing.

The 1942 motor-boat racing season in the United States suffered severely from wartime restrictions and gasoline rationing, which forced the cancellation of nearly all the nation's outstanding regattas. Such activity as there was was confined to southern waters early in the year and to those midwestern and Pacific coast areas where motor fuel was not at the time restricted. There were few, if any, new boats built for either speed or cruiser racing.

In spite of the limited number of events and participants, five new speed records were certified by the racing commission of the A.P.B.A., as listed in the accompanying table.

Inboard Mile Trials, 1942

Class	Speed	Boat	Driver	Place
225-cu.in. hydro (II)	77.670	Invader	Thos. Ince	Lake Elsinore, Calif.
135-cu.in. hydro . .	73.781	Dinah Mite	Bud Meyers	Salton Sea, Calif.
Class B Rac. R'b't. .	48.387	Dragon XV	Sammy Crooks	St. Petersburg, Fla.
Inboard Competition (5 Miles)				
Class C Rac. R'b't. .	48.361	Saganna	Fr. Foulke	Miami, Fla.
Class B Rac. R'b't. .	45.778	Dragon XV	Sammy Crooks	Lakeland, Fla.

The major trophy events held in 1942, and their winners, were as follows:

Inboard Trophy Winners, 1942

National Trophy (National 91 Champion, St. Petersburg)—"Tops Pup," Jack Cooper.
Auerbach Memorial Trophy (Miami)—"Mercury," Marion J. Cooper.
Hearst Trophy (New Martinsville, Ind.)—"Tempo V," Guy Lombardo.
Palais Royal Trophy (New Martinsville, Ind.)—"Tempo V," Guy Lombardo.
Pacific Motor Boat Trophy (Salton Sea)—"So Long, Jr.," Lou Fageol.
Webb Trophy (Springfield, Ill.)—"Tops IV," Jack Cooper.
International Aquagatta (Buffalo)—"Chrissie IV," George Schrafft.

In the outboard competitive field, the same conditions governed as in the inboard events. The chief regattas of the east were cancelled, but outboard competition continued on a limited scale in the midwest and Pacific coast areas. The following awards were made:

Outboard Trophies and Winners
Eastern High Point Champion—Don Whitfield (amateur).
Eastern High Point Champion—Fred Jacoby, Jr. (professional).
Hearst Perpetual Gold Trophy (Long Beach, Calif.)—Herb Rimlinger.
New Jersey Outboard Assn. Marathon—Charles Strang.

Motor Racing: *see* AUTOMOBILE RACING.

Motor Transportation.

The common carrier motor bus industry comprised two main operating groups, those companies operating intercity or long-haul service and those engaged in purely local service within the limits of a single city and its adjoining suburban areas. A common carrier is defined as one that operates between fixed termini at a fixed rate of fare. Common carrier operation was protected by franchise or certificate granted by a regulatory body. The long-haul common carriers divide roughly into companies operating within the boundaries of one state, known as intrastate carriers, and interstate carriers, which were licensed to operate across state boundary lines.

All types of common carriers were closely regulated, either by state, federal or municipal agencies, and in some cases by all three. Interstate highway carriers were under federal regulation after 1934. The body charged with this responsibility is the Motor Carrier Bureau, a division of the Interstate Commerce Commission. Intrastate carriers, those operating solely within the boundaries of a state, had long been under the regulation of their respective state governments.

The fundamental provisions of both federal and state regulation were similar. In addition to the granting of operating certificates, regulation also covered insurance requirements: equipment specifications; a standard accounting classification; the filing of tariffs, and compliance with the rates filed in those tariffs. City or local carriers were regulated in a somewhat similar manner either by the governing bodies of the cities or municipalities in which they operate, or the state regulatory bodies.

The Office of Defense Transportation, with Joseph B. Eastman as director, came into being as a result of an executive order issued Dec. 18, 1941, by President Roosevelt. The order delegated to ODT sweeping emergency powers over the nation's transport facilities. Its powers were further broadened by executive order issued May 2, 1942. This latter order, among othe things, directed ODT to "formulate measures to conserve an assure maximum utilization of the existing supply of civilia transport services dependent upon rubber, including the limitatio of the use of rubber-borne transportation facilities in nonessentia civilian activities, and regulation of the use or distribution of suc transportation facilities among essential activities."

THE FIRST BRITISH BUS with producer-gas trailers appeared on the streets of London in 1942. Producer-gas is derived from coke or anthracite

Acting under this mandate ODT issued various orders durin 1942 which had a marked effect upon motor carriers, both moto bus and motor truck. State, municipal and federal regulator bodies worked closely with ODT in implementing its wartim measures. Chief measures were those which abolished charter an sightseeing services for the duration, which curtailed city services and brought similar curtailments to intercity and other types o long haul service.

Buses.—The common carrier motor bus industry in 1941 represented an investment of approximately $550,000,000 in plan and equipment. This does not include a valuation for franchis rights, which under many state laws could not be capitalized.

Motor bus riding increased tremendously in 1942 in both cit and intercity fields. Main contributing factors were the lessene use of private automobiles, and increased riding stemming directl and indirectly from the war effort. In cities, for example, an particularly in heavy manufacturing centres, to-and-from-wor riding increased as much as 60% over 1941 in some instance and the nation-wide average was over 40%. Intercity carriers fo the year likewise showed increases of 60% above 1941 for th whole of the United States.

An actual count of passengers carried in 1942 on motor buse was not available at the close of the year. However, based o 1941's total of 4,800,000,000 passengers, a fair estimate would b 8,000,000,000 bus riders in all common carrier categories fo 1942, or an increase of over 3,000,000,000 passengers compare with 1941.

Including 1942 deliveries the line haul carriers of the moto bus industry owned and operated approximately 65,000 buse There were some 3,500 common carrier companies, divided 2,60 in intercity service and 900 in local transportation. Service wa given by these carriers over approximately 393,000 mi. of highway of which 345,000 was intercity route and approximately 48 000 miles represented city and suburban operation. In additio there were 79,000 school buses serving 1,383,000 mi. of scho route, and carrying 4,259,000 school children daily to and fro their classrooms.

The previous ten years showed an ever-quickening changeov from street railway to bus operation in cities. In 1942, 726 citi having a population of more than 10,000 were served entirely b buses. (There were 1,077 cities in this population group.) Substitution of buses for street cars, however, was halted for th duration under orders from ODT.

Buses were shouldering a number of purely military respons bilities. For example, the selective service system was using buse on a large scale for shuttling drafted men to and from examin tion and induction points, while the army itself used commerci buses extensively for carrying troops in military movements. Th carrying of army, navy and other military personnel on furloug and for the transfer of men between posts and bases, likewi afforded the industry a significant opportunity to perform esse tial wartime services. Should the evacuation of certain areas b come necessary, or should it be necessary to transport large arm forces across the country with the utmost speed, the industr with its vast available pool of equipment and trained personn would be ideally fitted to shoulder that responsibility, and pla were prepared against such an eventuality.

Trucks.—There were many ramifications to the motor tru

Table I.—*Distribution of Motor Truck Fleets by Industries in the U.S.*
(Source: *Commercial Car Journal*, figures of March 1941)

As of March, 1941	Fleets of 8 or More Trucks	
	Fleets	Trucks
eries, Candies, Florists	1,485	62,342
lers, Breweries	930	24,046

tractors, Builders	2,457	50,775
y Products, Milk, Ice Cream	1,485	62,553
artment Stores, Furniture	417	11,020
r, Feed, Grains	140	3,433
ernment, State, County, Municipal	2,060	239,902
Dealers, Manufacturers	575	15,011
ndries, Cleaners, Dyers	1,556	34,766
ufacturers, Steel Mills	837	15,624
ts, Fish	670	17,489
or Freight, Local, Inter- and Intra-State	5,301	176,313
spapers, Publishers	137	4,988
ts, Chemicals, Drugs	170	3,723
oleum Products	1,224	75,045
ic Utilities, Railroads	1,210	79,545
ners, Vegetables, Chain Stores	1,517	39,769
ellaneous	1,059	23,851
otals	24,271	958,492

and in size it far exceeded the bus field. Trucks were used only by cartage companies in cities and by long-distance haul- but by private businesses as a part of their service to cus- rs. The 1942 edition of "Motor Truck Facts" published by Automobile Manufacturers' association showed, for instance, there were 1,047,084 trucks on farms alone. This same issue ed that 4,911,500 trucks of all types were licensed during the 1941.

e large truck fleets were owned mostly by private shippers. Bell Telephone company, for instance, operated 18,200 s; Standard Oil of New Jersey, 12,000; the National Dairy ucts company, 8,805. According to compilations of the Auto- le Manufacturers' association 36 private companies operated than 1,000 trucks apiece.

ilroad use of motor trucks was rapidly expanding. In 1925 a of 900 trucks were used in railroad service. By the end of this had grown to approximately 94,000 trucks in railroad A 1941 report showed that trucks served 54,000 communities eached by the railroads.

e trucking industry in 1941 gave employment to more than ,000 drivers, with an uncounted number of freight handlers, anics and helpers. It is closely regulated in every state as to weights and speeds and must conform to innumerable other ations both state and federal. n of South Africa	294	45	339

1942 the decline in the numbers of vehicles continued, and any countries, especially in or close to the war areas, even sary motor transport, *e.g.*, the delivery to retail customers odstuffs, was curtailed. In Great Britain 1941 closed with te motor cars having a basic allowance of gasoline, which ed the car to run about 160 mi. a month regardless of the purpose for which it was used. This was reduced to about half, and ceased altogether at the end of June 1942. Subsequently all gasoline issued was for particular uses, and motorists using it otherwise were liable to heavy fines. In France the cut was even greater; it was well-nigh impossible to obtain gasoline for any use not definitely a government object. Generally this was the condition in all countries in Europe occupied by the Germans. Though the reduction was perhaps greatest in Europe, some reduction was universal. For instance, in South Africa the basic allowance of gasoline for private cars permitted of some 400 mi. per month being driven.

The reduction in civilian motor transport was not met by a corresponding rise in military transport. In some countries, owing to shortage of fuel, this even declined from the level of 1941. As a result, there was substantially less traffic on the roads even allowing for some increase in animal drawn traffic and pedal cyclists. In consequence the heavy toll of persons killed and injured on the roads declined. In Great Britain, since the beginning of July 1942 the reduction of deaths was about 25% on the figures for 1941. The number injured fell more than 30%. A regrettable feature was that the number of children killed or injured remained high. Great Britain and the bulk of the continent of Europe were liable to attack from the air; therefore street lighting was nonexistent, and the lights on vehicles were severely curtailed. This inevitably added to the dangers of motoring. Moreover, vehicles were getting older, many being continued in use long after they would have gone to the scrap heap in normal times. Over and above this the standard of maintenance declined and vehicle failures were more frequent. (*See* also ACCIDENTS; RAILROADS.) (W. T. St.)

Motor Vehicles: *see* AUTOMOBILE INDUSTRY IN THE WAR.

Mountbatten, Lord Louis (1900–), British chief of the combined operations (commandos), was born June 25 in Windsor, England, as Louis Francis Albert Victor Nicholas of Battenberg. His father, Austrian-born Prince Louis of Battenberg, was a cousin of King George V; his mother, Princess Victoria, was the eldest daughter of Louis IV, grand duke of Hesse, and a granddaughter of Queen Victoria. His father, who was a British admiral during World War I, retired from the navy and relinquished his title because of anti-German sentiment and changed the family name to Mountbatten in 1917. A naval cadet at 13, Lord Louis Mountbatten served as a midshipman aboard British battleships during World War I and was a sub-lieutenant in a submarine flotilla at the armistice. Early in World War II he was a captain in command of a destroyer flotilla and was in the thick of naval battles off Norway and Crete. Two destroyers he served on were mined and torpedoed, respectively; he brought each back to port safely; a third was sunk by nazi dive-bombers off Crete and he was picked up by another warship. In May 1942 Prime Minister Churchill revealed that Lord Mountbatten had been chosen to replace Sir Roger Keyes as chief of the commandos. As head of the combined operations of three military services, he directed the commandos in their daring raids in 1942 off the coasts of Norway and France.

Mount Holyoke College. An institution for the higher education of women in liberal arts, founded in 1837 by Mary Lyon and situated at South Hadley, Mass. In 1942 a unit of the naval reserve midshipmen's school (WR) was established on the campus, and some of the college facilities were turned over to the United States navy without decreasing the college enrolment. The campus covers

480 ac. with more than 70 buildings. For statistics of student enrolment, faculty, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (R. G. HA.)

Mules: *see* HORSES.

Municipal Government.

Their first war year found U.S. cities adhering remarkably close to the defense pattern laid down in 1941. Some of the war problems indicated in that year stood out in sharper relief, and fresh ones were added. On the other hand, cities in many instances were enjoying a new vigour and prosperity stimulated by wartime activity, though recognized as probably of temporary duration. Fiscal problems engendered by greatly increased expenditures without a corresponding increase in revenues were becoming a major item of concern. Consciousness of the temporary character of the war setup and economy produced widespread interest in postwar planning with a view to bridging effectually the gap between war and peace when hostilities end.

Transportation; War Damage Insurance.—Municipalities continued their collaboration with the federal and state governments and the assumption of local responsibilities in the successful prosecution of the war effort. The transportation crisis resulting from curtailed use of private motor cars was being met by a nation-wide plan, set up by the Office of Defense Transportation, to secure the greatest possible use of existing local transportation facilities. This included: (1) staggering business, school and working hours; (2) group riding; (3) improved traffic regulation and control. It called for establishment of a transportation committee and an administrator on both the state and local levels. By July 1, such programs were either instituted or underway in every state. Over 500 state and local war transportation administrators have been appointed. Staggered hours and group riding plans were in effect in many cities. About 40% of the bus stops were eliminated in New York city. Many other adjustments in the use of local transportation facilities were in process everywhere.

Local governments were requested by the Office of Price Administration to designate a municipal government mileage administrator to survey the transportation needs of the various departments and arrange to reduce driving by 40% or more as compared with 1941. Local government officials and employees were given preferred mileage in connection with their official duties. Gasoline rationing had not up to the close of 1942 seriously affected the operation of essential city services.

Many cities purchased federal war risk insurance, made available July 1. Most cities insured city buildings and their contents, city bridges and reservoirs; others, police and fire alarm systems, automotive equipment, and municipally-owned utilities.

Defense Housing.—The federally aided public housing program furnished the only widespread example of the city building and rebuilding which must be undertaken on a huge scale after the war. This was essentially a local program, despite the federal aid feature. The Federal Public Housing authority supplied government housing. It used local housing authorities wherever possible to construct and manage war housing projects; in other cases, it sought the advice and help of local officials. (*See* also HOUSING.)

The National Housing agency (into which 16 federal housing organizations were consolidated in February) evolved a war housing program based on the needs of an estimated 1,600,000 immigrant workers, one-half of which entailed new construction to be financed 60% out of public funds. The $600,000,000 Lanham act appropriation for this purpose voted in October brought total of federal funds provided for publicly financed war hou projects up to $2,017,288,800. A supplementary leasing prog was also announced, involving conversion of existing pri structures into homes for war workers.

Provision was made for payments in lieu of taxes to be m to local governments by both federal and local housing proj so far as the revenues permit in the latter case.

War Production Board.—In order to deal with the pri requirements of municipal governments and other governme institutions, there was established in the War Production boa "Governmental Division."

Finances.—Several aspects of municipal finance sho marked improvement over prior years, reflected in either existing or expected surplus in a number of cities. But the r rates of expenditure with no corresponding increase in reve and the prospect of a decline in revenues from non-tax sou were causing considerable concern. A survey of 185 cities sho two-thirds of them to be spending more in 1942 than in 1941, nearly 10% to be spending as much. Increased amounts expended for safety, health and sanitation, salaries and wage employees, and reserve funds for emergencies. Population creases, salary and wage rises, the higher cost of supplies, an some cases the assumption of new activities, were responsible the increased outlays. Civilian defense was in most cases ing more in 1942 than in 1941, especially in war industry cen and cities in coastal areas.

To offset increased expenditures and decreasing revenues, e omies were effected through deferment of capital construction essential to the war effort; reduced street maintenance and b ing inspection; doubling up on vacancies in city departments; tailment of city services; and the adoption of various devices greater operating efficiency.

Tax collections improved, due to the upward trend in gen business conditions. But losses in non-tax revenues were n because of decreases in state gasoline and motor vehicle lic taxes, in bridge and tunnel tolls, parking meter fees, building mit fees, and business licence revenues. However, few sources of local revenue were found necessary.

The average tax rate of cities declined slightly in 1941–4 the first time in seven years. There was a slight increas assessed values. These trends were reversed, however, in larger cities (over 500,000 population), which continued to s a decrease in assessed values—though at a decelerated rate— an increase in tax rates.

The drastic curtailment of capital outlays brought a pr itate decline in municipal borrowing. State and municipal sales, for instance, which totalled $1,229,493,072 in 1941, amou to only $570,240,728 in 1942—much the lowest figure in a dec Election authorizations of municipal bonds totalled $50,559 for the first ten months of 1942—a drop of $120,973,000 f the same period of 1941. No sizeable issues for capital cons tion were authorized at the November elections. Interest on municipal bonds were 2.13% and 2.16% on Nov. 1 and De respectively, according to the Bond Buyer's monthly index b on bonds of 20 large cities, compared with 1.90% and 1.9 respectively, in 1941—the lowest yields on record.

A census bureau study showed a decline of 2.2% in the g debt of cities of over 25,000 population during the 1942 f year. Even New York city reduced its debt $19,000,000, in trast with prior years. This reduction reflected the trend in p tically all units except local housing authorities, which obliged to expand their indebtedness to meet the needs of def housing.

Relief.—With the unemployment situation considerably d by the demands of the war situation, local expenditures for f diminished notably in 1942. When WPA was abolished in ember by presidential order, the number of WPA employees declined from a peak of 3,335,000 in 1939 to about 350,000.

rsonnel.—The lack of any manpower program as applied to ic employees resulted in a sharp loss of employees to the ary services or to defense industries. This was being met in a oer of cities by adoption of a temporary wartime appoint- s program, as in Detroit and Los Angeles; also in San cisco, subject to state ratification. Pasadena was experi- ing among its employees with the "manning tables," ap- by the War Manpower commission in determining a man's rtance to essential war industries. In New York, Mayor uardia appointed a local manpower commission, to place be- local draft boards requests for deferments of trained city oyees whose loss would endanger essential city services.

essure continued for salary increases due to the rise in the of living. An important government statement issued in mber specified that municipal governments, within certain ations, may adjust salaries and wages upward without prior oval of federal agencies. In-service training programs for cipal employees included full-time courses for finance ad- tration personnel at the University of Kentucky in the sum- of 1942, and preparation by the Bureau of Training of the Service commission of a comprehensive three-year training am for New York city's 32,000 transit employees. All war ng for civilians was being centralized in certain states, nota- New York and Pennsylvania, under their state war councils. ols financed from OCD funds were opened at various uni- ies for firemen, policemen and others to qualify them to instruction in civilian defense training programs in their ctive states and communities. The National War Labor on Dec. 15 decided, in a case arising out of a strike of rk, N.J., city employees, that it was without jurisdiction to ene in disputes between cities and their employees. This tant decision—which also averted a threatened strike for a wage increase by the New York city transit employees— leemed a signal triumph against federal invasion of munici- ome rule, civil service, local budget control, and other safe- s of local self-government.

y Manager Plan; Proportional Representation Elections. neteen additional cities and one county in the United States ed the council-manager plan in 1942, giving a total of 537 cities and 7 such counties in this country as of Dec. 31, Houston, Tex., became the third largest city in the United s to operate under a council-manager charter. One city to abandon the plan, making a total of 28 cities which abandoned the plan during the 34 years since it was first urated. Lowell, Mass., became the tenth proportional repre- ion city in the United States, besides adopting the council- ger plan. Yonkers, N.Y., voted to retain P.R. by a vote o to one, against the combined opposition of both the Re- can and Democratic party organizations.

nning.—One of the most important developments in the ing field was the increased dependence on regional rather municipal planning in connection with such wartime needs cuation programs, traffic relief and transportation plans, war ng, and postwar planning. The regional planning committee in the Detroit defense area, for instance, represented 10 The already famous Uthwatt Committee report from Britain (*Report of the Expert Committee on Compensa- nd Betterment*), dealing with the public control of the use d with a view to safeguarding reconstruction after the war, nvisaging national control over local planning agencies, was tstanding interest to American city planners and public officials.

Postwar Planning.—The shortage of manpower and materials, plus the need to economize, necessitated the wholesale deferment of capital improvements until after the war. Many cities, however, engaged actively in the preparation of plans for postwar construction and reconstruction. Nine states enacted laws authorizing their cities to build up reserves now for postwar improvements so as to absorb the manpower released from war activities without creating large volumes of new indebtedness. The National Resources Planning board continued its activities in this field. Its pamphlet, *Better Cities,* presented some basic ideas for rebuilding the cities after the war on a scale never undertaken heretofore.

Miscellaneous.—The tragic Cocoanut Grove night club fire in Boston in November, which took nearly 500 lives, resulted in the arrest of a number of city officials, including the city building commissioner, city building inspector, a police captain and fire lieutenant, and brought home to all city governments the need to expand the investigation of fire hazards to all large places of public entertainment.

(L. Gu.; A. M. Ds.)

Munitions of War.

As 1943 entered, the United States could look back upon two years of increasing accent upon that whereon depended most directly its continued existence—munitions of war. Men it had, and in numbers sufficient, but the problem of supplying them, and others allied, with the tools of warfare was still paramount. 1941 had been a year of guns *and* butter, with every effort directed toward maintaining production of commodities for civilian consumption at the highest level compatible with the current defense effort. As 1942 came upon the scene, with Pearl Harbor a fresh and bitter memory, the picture changed. Now it was *guns*—butter too, if possible, but guns anyway. But as 1942 drew to a close, it was GUNS! Butter, even in the absence of official rationing, had already become next to unobtainable in many urban areas.

Fantastic production figures set for 1942 were met in some instances, missed by varying margins in others—surpassed in a few. In January, President Roosevelt had called for 60,000 aeroplanes, 45,000 tanks, 20,000 anti-aircraft cannon, and 8,000,000 tons of new merchant shipping before the year's end. Of these, some 85% were produced, viz.: 48,000 aeroplanes, 32,000 tanks and "motor gun carriages"—self-propelled guns called "tank destroyers"—and 8,090,800 tons of cargo vessels. In some instances, quantity figures had been revised downward to permit greater accent on quality (*i.e.,* greater endurance, speed and striking power). By the end of September, United States war expenditures since July 1940, had reached $50,000,000,000; for 1943, were estimated at $90,000,000,000 more. The overall program, spent and to be spent, now called for $240,000,000,000—as against a total of $64,000,000,000 for military purposes, World War I included, during its first 150 years of existence.

The close of 1942 witnessed a world of warring nations, all attempting to develop new and more formidable weapons, but everywhere under conditions of utmost secrecy. Thus the United States refused to release a word descriptive of any innovation in combat matériel until it was known positively that a specimen had actually been captured by enemy forces. Meanwhile, preexisting types continued to perform with varying efficiency. We find, with respect to:

Aircraft, Army.—As in the past, horsepower ratings were increasing, with single motors developing upward of 2,000 h.p. Ceilings were rising toward 50,000 ft. Low-level bombing was becoming increasingly popular, while the problem of how to register hits on "hedge-hoppers" with anti-aircraft guns remained difficult of solution. Bigger bombers and cargo carriers, of sizes predicted to stagger the imagination, some of tail-less construction, and mounting heavy cannon, were on the way. Fighters were heavier and farther ranging.

German fighter planes appeared with pressurized cabins for operations at extremely high altitudes since at above 10,000 ft. the oxygen available becomes too scanty for normal human activity, while above 25,000 ft., auxiliary oxygen equipment is necessary. At above 40,000 ft. life cannot be sustained even in an atmosphere of pure oxygen save in a sealed compartment (cabin) under pressure. But planes were already operating at such heights, and higher, as witnessed by the destruction during the year, at 50,000 ft., of a German Junkers 86 pressure-cabin reconnaissance-photographic plane by a British Spitfire. To perform at these levels, powerful engine superchargers were required. These increased overall weight, but apparently without appreciable detriment to manoeuvrability.

Fighters.—Weights varied from 7,000 lb. (Germany's FW-190) to 14,000 lb. (U.S. P-38). Armament ran from a half-dozen machine guns upward. Highest reported combat speeds were still in the 400 m.p.h. zone, though press reports credited a new speed-dive record of 725 m.p.h. to two American air corps officers in P-47's during November.

The most astonishing innovation in armament concerned the introduction, on Germany's Me-109-F1 and F2, of a new, Mauser-made, automatic cannon in 20 mm. and 15 mm. calibres respectively, with a rate of fire of 900 r.p.m. (rounds per minute) as against 90 r.p.m. for the 20-mm. guns in the wings of the earlier 109-F. Weight of 20-mm. projectiles fired at this rate would total 784 lb. in 60 seconds—several times that of any other cannon-equipped single-seat fighter. But since 200 rounds only were carried, the full advantage of the high fire rate was not exploited. Plastics were figuring heavily in allied plane construction, though lack of these at certain points in Germany's Me-109, where heavy ceramic materials appeared in their stead, suggested a plastic shortage in that country. German pilots were faking "dogfights" among themselves to lure unwary allied pilots to destruction. Russia was using an improved U-2 plane in the Stalingrad area. Largely of fabric construction, it could take off almost anywhere because of its light weight, and land on an open field at night with the aid of a flashlight. Despite its low speed (60–90 m.p.h.) it proved more useful for strafing than the average dive bomber. Germany's reputed best fighter, the (Focke-Wulf) FW-190, and succeeding models, was far inferior to Britain's latest Spitfire at anything over medium altitudes, performing best at 18,000 ft., while the Britisher remained nimble at 40,000 ft. and over. Behind this lay the fact that there was no such thing as an aeroplane capable of performing equally well at low, medium, and high levels, *i.e.*, sea level to 15,000 ft., 15,000 to 25,000, and above 25,000. Thus the FW-190 climbed spectacularly below 10,000 ft., but fell off rapidly as it reached the upper limit of its low-speed supercharger. When its second-phase supercharger was engaged, it regained its earlier rate of climb and held it handily to 18,000 ft., beyond which, however, performance quickly became mediocre. In like manner an engine, such as that of the Spitfire, which developed its maximum at 25,000 ft. and above, showed inferior performance at lower levels. Hence the need for ships of both types if all contingencies were to be met successfully.

Outstanding American fighters of 1942 included the P-38 Lightning, supercharged to operate at 40,000 ft., the P-47 Thunderbolt, and the P-51 Mustang. Some forecasters held that the P-47, some that the P-51, would develop into the finest fighter of 1943.

Britain had brought forth a fighter-bomber to operate at tree-top levels. Its two delay-action bombs, released together, ricocheted along the ground surface to explode after the parent had passed overhead. Instantaneous fuses would have been de to both plane and target, since a 250 lb. bomb creates a ver danger zone of 1,500–2,000 ft. on detonation.

Japan's army fighters included three newer types, viz., "100," army version of the navy Zero (later described), German-designed Messerschmitt 109, with 1,100 h.p. liquid-co engine, service ceiling of 36,000 ft., and a maximum spee 350 m.p.h., and the Nakajima, introduced in 1941, a 400 m twin-motored ship more heavily armed than the other two. R was accenting medium bombers rather than fighters, with information available on 1942 models of the latter. Italy using her Macchis over Africa. An Italian engineer, Cam had produced a jet-propelled aeroplane, probably the first to fly without a propeller. Designed to compensate for the propeller efficiency attainable prevailing in the rarefied at phere of high altitudes, air to effect the jet reaction was pressed by a conventional radial aircraft engine and rele through ports in the tail of the ship.

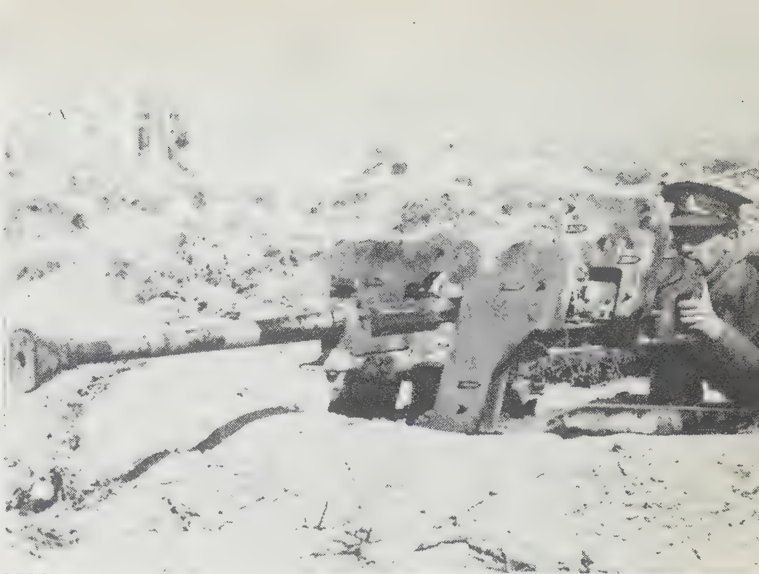
Bombers.—While dive- and torpedo-bombers continued to heavy toll (the United States lost four aircraft carriers, and seaplane tender during the year, chiefly as a result of their act light and medium high-altitude bombers, and the heavy as were constantly being heard from. In April, the American eral Doolittle paid an historic visit to Tokyo with his (medi B-25s. These ships, with a speed of 300 m.p.h. and capab transporting a bomb load of 4,000 lb., were said to outclass of like characteristics, as were their next of kin, the (fa B-26s. Britain had introduced a new reconnaissance bomber "Mosquito." Powered by two Rolls-Royce engines, its arma was estimated at four 20-mm. cannon and four 303-cal. mac guns.

In the low-level attack bomber class was the American A carrying more bombs and flying faster than Britain's prin attack-bomber, the Blenheim. Among Germany's latest bom of various classes were the new Dornier Do-217 multipur ship, a 3-seat Blohm & Voss Bv-141, the Heinkel 4-motor He and the Junkers Ju-91. Its bombers were now being use groups of mixed composition, including the single-motored J and twin-motored Ju-88s, as well as the He-111s. Shortag bombers was compelling the conversion of many transport pla and the use of these vulnerable ships as impromptu bom when command of the air was reasonably assured. Of Ru medium bombers both single and two-engined types were se service. These included the recently introduced MIG-3 single 1,200-h.p. motor, the I-17 of earlier vintage, and the t motored 2KB-26. Japan was using three types of dive bom including the "96," "97," and a new Nakajima 2-seat model.

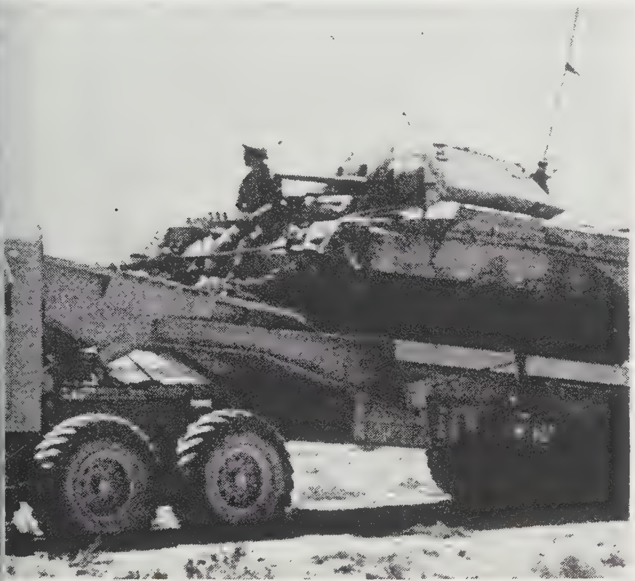
Heavy Bombers.—America's B-17 high-altitude Flying Fort designed eight years earlier, was showing no signs of senesce while the B-24 Liberator was acclaimed by the British as or the finest aircraft in existence. Both carried smaller bomb l (4,000 lb.) than comparable 4-engined heavy British bom but could work at higher altitudes and greater operating ra They were capable of day or night operations, whereas Br heavy bombers (*e.g.*, Lancasters) usually acted only during dark hours when, to insure accuracy, they were forced to f relatively low altitudes—well within the range of anti-air fire. Japan's heavy bombers were all 2-motored, with three t in use. Of these the fastest (280 m.p.h.) was the "98," kn also as the Mikado. With two 1,000-h.p. 18-cylinder Fiat m it had a range of 2,400 mi. carrying a 2,000 lb. bomb load low-wing monoplane construction, its crew numbered seven.

Cargo Carriers.—As the year ended, announcement was of the award of a $200,000,000 contract for the building

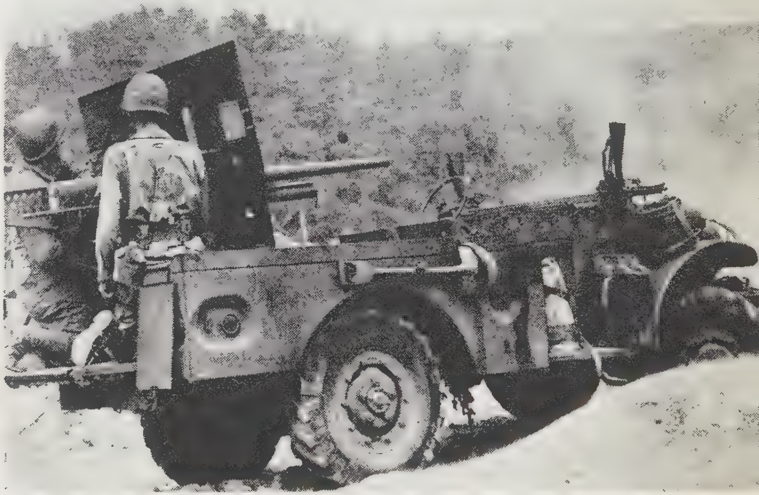
MOST PUBLICIZED GUN OF 1942 was perhaps the German mobile . gun, used with telling effect against British tanks in the Libyan desert summer of 1942



BEST ANTI-TANK GUN OF 1942 was the German 1-in. Guerlich, which by compressing shells in the tapered barrel blows them out at the extremely high velocity of 4,750 ft. per second. A British soldier is demonstrating this captured Guerlich



REPAIR of disabled tanks during battle was achieved by the Germans North African front in 1942. Recovery trucks hauled the tanks from the eld to repair depots, where they were speedily put into serviceable condi- he picture shows a British equivalent of the German recovery truck



A POTENT U.S. ANTI-TANK WEAPON, the tank destroyer, was introduced in 1942. Speedy and lightly armoured, the vehicle pictured carries a 37-mm. gun and depends on "hit-and-run" tactics

"GENERAL LEE" (M-4) tanks with welded hulls replaced the older U.S. "General Grant" (M-3) models in 1942

converted shipyard, of 1,200 U.S. army C-46, 6-engined, 150-ton cargo planes with a wing spread of 300 ft., to be composed largely of nonstrategic materials and capable of transporting 100 tons of freight. First deliveries were scheduled for Oct. 1943. Construction of the shell was to be of plywood in criss-cross layers over reinforced wire mesh. Some 50,000 workers, 80% of them women, were to be employed in the production of these ships. Precious aluminum, 30,000 lb. of which were going into each Flying Fortress, 10,000 into each fighter, would thus be saved for sterner purposes. Another new type of cargo plane, the Caravan, was a high-wing monoplane with 180 ft. wing span—somewhat like the earlier developed Commando; 68 ft. long, it was powered by two 1,200-h.p. motors. The Lockheed Constellation also appeared. It is capable of transporting a tank, and has an operating range of over 3,500 mi. The proportion of transport (cargo) planes to multi-engined bombers then being produced was as 1 to 5; in 1943 it was to be stepped up.

How many cargo carriers of earlier design the army had in use was undisclosed, but it was known that more of the DC-3 type ("Flying Boxcars") had been delivered to it in the seven months following Pearl Harbor than were in service on all the airlines of the world on Dec. 7, 1941.

Trainers.—America welcomed a new trainer plane, the PT-25. Made of bonded plywood, less than 2% of its weight consisted of aluminum alloys. Without forgings, castings, or extrusions in its make-up, and using no critical steels, it was a splendid example of the employment of substitute materials.

Gliders.—Gliders with two sets of wings, and capable of carrying 20 men, met successful tests in the United States. Though these were not yet in official use, the employment of 15-man gliders with a span of 80 ft. and towed two at a time, was already standard practise. One American factory was producing gliders believed to be as large or larger than anything Germany had evolved—able to transport light artillery or small combat cars. But while gliders were rendering excellent service under suitable conditions, night landings by them even in bright moonlight, remained fraught with utmost danger.

Aircraft, General.—The U.S. B-24 Liberator bomber contained 315,000 separate parts and required for the production of its components, the services of 1,400 different manufacturers in the United States and Canada. Prime contractors for aircraft had thus become practically nothing more than "airframe manufacturers," building as a rule only wings and fuselages, almost all other parts being made for, and delivered to them by subcontractors. Planes capable of spending 50 hours in the air—and making a non-stop round trip between the U.S. and Germany, were in being. A new 6-bladed propeller for 2,000-h.p. motors had two sets of 3 blades, rotating in opposite directions, effecting faster and smoother flight than earlier forms. Many of the German fighters brought down in 1942 lacked bullet-proof gasoline tanks, indicating dire shortages in certain important materials. Germany was nevertheless said to have developed two new types of stratosphere fighters, with ceilings of 48,000 ft.—really different versions of the same ship, the Junkers 81-P. Both had pressure cabins and were powered with two, 1,000-h.p. Jumo 207, 6-cylinder, opposed piston, compressed ignition motors with exhaust-driven turbo-superchargers.

To relieve the pilot of a dive bomber of the necessity for flying constantly in the prone position to avoid physiological "blackout" a hinged seat was devised which threw him backward into the supine position as the plane passed from downward to upward flight at the termination of a dive. Another mechanism relieved him of the controls as soon as his bomb was released, the plane operating under gyro-control until danger of blackout had passed. A new German Focke-Wulf plane, still in the experimental stage, was said to carry its whole crew of three in supine position.

Aircraft, Navy.—The U.S. navy's air program called 27,500 ships by early in 1944, this in accord with the presid announced objective of 185,000 aircraft of all types to be duced during 1942 and 1943. To man its new planes, 30 student pilots were to be trained annually. Total naval expe tures for aircraft over the fiscal years 1940–1943 was to over $5,750,000,000. The folding wings of the navy's stan carrier-based fighter, the F-4-F Wildcat, increased slightly weight, but made it possible to enlarge the number assigne each carrier vessel. The new carrier based TBF Avenger tor bomber, powered by a single air-cooled engine, and carrying torpedo, was already commencing to replace the earlier T Devastator, the navy's standard torpedo bomber when the opened. Her standard carrier-based dive bomber, the S Dauntless, though performing admirably, was soon to be repl by an improved model—already in production.

The much-discussed Japanese Zero, so named because its of introduction—1940—fell in the year 2600 on the Japa calendar, was powered with an air-cooled, 14-cylinder, 900 two-row, radial motor with 3-blade, constant-speed, hydra type propeller which gave it a top speed of 340 m.p.h. and operating range of 2,000 mi. or more. 30 ft. 3 in. long, its w spanned 35 ft. 5 in. As on the U.S. navy's F-4-F, they hinged for folding. A single seat monoplane, its armament cluded two 20-mm. low-velocity cannon (one in each wing), 60 rounds of ammunition for these, also two 7.7-mm. mac guns, each with 500 rounds, in the nose, firing through the peller disk. Ready for combat it weighed, without belly t 5,200 lb. Its light weight made it extremely easy to handl to 200 m.p.h. and capable of making a fast roll at 225 m.p.h captured specimen however, tested in dives at speeds appr mating 400 m.p.h., developed marked "flutter" and vibration

Torpedo planes of all nations continued to take heavy among surface vessels. Flying almost at sea level (5 to 30 me above) they launched their deadly missiles at distances of 4,000 metres, and proved extremely difficult to hit with aircraft fire. (*See* also AIR FORCES OF THE WORLD.)

Anti-Aircraft.—Apart from anti-aircraft artillery (*see* bel the barrage balloon continued to constitute one of the major ments of air defense for urban areas and other likely target air assault. Three types were in use, the high altitude, low tude and very low altitude. In size these varied from a lengt 30 ft. for the smaller (very low altitude) to about 120 ft. the largest (high altitude) with diameters roughly averaging third these figures. Two varieties of construction were emplo the "dilatable" and the "ballonet." The former consisted single cell, with an envelope which exhibited four or more lo and was designed to permit increase in its volume as it rose the contained gas (helium or hydrogen) expanded. On desc ing, the process was reversed. The ballonet type embodied separate chambers, one filled with gas, the other with air, s rated by a diaphragm. As it ascended, the lifting gas expa and forced air out of the bottom of the air chamber. Du descent, the opposite occurred.

Anti-Submarine.—The navy "blimp" had proven a better tion of the coastal submarine menace than patrol planes or army bombers, this by reason of its ability to cruise slowly hover over any suspicious spot on the ocean's surface.

Anti-Tank.—*See* "Artillery," below.

Army.—As 1942 ended, the United States had some 5,00 men—70 divisions—under arms, 1,000,000 of these over Estimates called for a 7,500,000-man army with 700,000 offi by the end of 1943, and 2,500,000 more in the navy and c rd. Of the army's 7,500,000, a breakdown showed:

Air forces	2,200,000
Ground forces	3,300,000
Services of supply and related units	2,000,000
	7,500,000

e fighting elements of these 7,500,000 would be assigned to e 100 different divisions of an average strength of 15,000 men, 1 18,000 more required in the supply services back of each to p it functioning—a total of 33,000. Germany by stripping pare essentials was getting along in 1942 on 28,000 combat and ply troops per division.

orecasts for 1943 indicated that before the close of that year, of the 130,000,000 people in the United States would be in orm or in industry.

o train some 250,000 of the nation's youth annually for mili- service, both before and after formal induction (4,500,000 already been inducted since Oct. 16, 1940), the war and y departments had formulated a joint plan to employ the lities of between 200 and 300 colleges and universities. At e, the usual liberal arts courses would be eclipsed for the ation. Earlier in the year (Sept.) there had been announced an for pre-military and pre-industrial training to be open to 0,000 youths in the nation's 28,000 public and private high ools through voluntary enrolment in a "Victory" corps.

o complex had become the nation's fighting machine that 63 of 1 100 men inducted were now assigned to duties requiring ialized training of some kind. And so highly mechanized had ome the armoured forces that they now embraced a vehicle each 5 men—and one armoured vehicle to each ten. Apart n special training for enlisted men, officer candidate schools e producing 12,000 new officers a month, one for each 20 men. duates from preflight schools were being turned out at the of 40,000 a year. By December a squadron of Negro fliers of its kind, was soon to proceed overseas. Earlier in the , a Negro infantry division, the 92nd, had been actuated.

o save military manpower, army, navy and coast guard under- k to recruit women for their auxiliary organizations known as WAACS, WAVES and SPARS. So satisfactory did these ve that they were steadily undergoing enlargement. Thus the ACS, totalling around 10,000 in November (of an authorized 00) received authorization to expand to an ultimate 150,000, 00 of these to be enrolled by July 1943. Some forecasts pre- ed a total of 200,000 WAACS, and 150,000 WAVES and ARS by the end of 1943. Some 83 of America's business and essional leaders, realizing the importance of a close under- ding between army and industry, enrolled at Ft. Leaven- th, Kan., in October for a four-week orientation course in y organization and procedure.

f America's allies and enemies, manpower figures were not too nite. Canada had expanded her prewar army some 89 times, corps 38 times, and navy 27 times. Even pacifist India had 1,000,000 men in arms within her borders, apart from those to various far-off theatres of operations. Ten millions of the S.S.R.'s population of 166,000,000 were in military service. many was thought to have some 7,000,000 men (300 divisions) er armed forces. Four million between 18 and 40, 3,000,000 e between 40 and 50. Despite modern military specialization, which she was largely responsible, 75% of her forces con- ed of plain, old-fashioned infantry. In war work Germany 24,000,000 more, thus:

German males	12,300,000
German females	8,600,000
Foreigners	1,800,000
Prisoners	1,300,000
	24,000,000

Japan, which, in 1935, had introduced premilitary training for the 2,500,000 boys attending its 15,000 schools, was believed to have some 90 divisions in the field.

Army Production.—Though great stress was being laid on production achievements, the United States was not more than half way to a full weekly schedule of 168 hours (three 8-hour shifts for each of the seven days) in most of its factories. But she was commencing to exploit her large reserves of woman power, with over 300,000 women already employed in war department activities by September, and an estimated 250,000 in air craft plants alone as the year closed—against 2,000 in 1941. Early in the year, census records had shown 51,600,000 males and females employed in the United States—an all-time record. In December, almost 900,000 civilians were engaged in activities of the army supply services alone.

On July 1, 3% of skilled workers were women. Two months later (Sept. 1) the figure had risen to 10%, with women furnishing 35% of all the unskilled labour then employed. By way of munitions production, a single firm was turning these out at the rate of $8,000,000 per day. In addition to huge "prime" contractors such as this, 170,000 small industrial concerns were working on subcontracts. Estimated value of the U.S. munitions output for 1942 was $55,000,000,000. Back of each soldier in the lines were 2½ men in industry—not 18, as per some exaggerated estimates. In the fall, production on certain types of munitions having met and even exceeded immediate requirements, projected expansion of various ordnance plants producing these were cancelled to permit diversion of the materials formerly allocated for them (tanks, bombs, shells, etc.) to the fabrication of other items (ships, aircraft) more urgently needed. By late October, U.S. aircraft production was exceeding that of Britain and Germany combined. Under a program announced in December, Philadelphia public schools were scheduled soon to be producing 37-mm. cannon shell at the rate of 25,000 a month.

Machine tool production for 1942 was forecast as 350,000 units of a value of $1,400,000,000, almost double that of 1941. By contrast, during 1929, peak year of post-war expansion, $180,000,000 worth had been marketed.

Artillery—Anti-Aircraft.—Calibres remained relatively stationary, with accent on increased velocities, and greater use of the heavier, longer-ranging, weapons. During the first half of 1942, Germany was employing its high-velocity pieces (as the 88 mm.) against ground targets of opportunity (*e.g.*, British tanks in Africa) with no little success. Her anti-aircraft units of the army proper (as contrasted with those assigned to the independent air forces) which had commenced the war with weapons of 20-mm. and 37-mm. calibres only, had begun to replace these in 1941 with a heavier type (50 mm.). However, this too failed, in 1942, to stop American-made tanks, and was superseded by others of 88 mm. and 105 mm.

Japan was using anti-aircraft guns in calibres from 13.2 and 20 mm. at the lesser end of the scale to 105 mm. on the upper. The 13.2 (Hotchkiss) had seen much use in China. The 20 mm. (Oerlikon) fired a ¼ lb. shell at a muzzle velocity of 2,500 f.s. For home defense Japan was employing mostly 75's, with a vertical range of 6,000–7,000 yd. and a horizontal range of over 10,000 yd. Her model '25, 105 mm. was capable of a rate of fire of 15 r.p.m. Both 75's and 105's had a full (360°) traverse and an elevation of 85°.

Artillery—Anti-Tank.—The problem of how to neutralize the tank by gunfire was being successfully met by the tank destroyer or "motor gun carriage." Developed by the U.S. during and after World War I, then allowed to languish, it was now revived in a new and better form built on the General Grant medium tank chassis. It had been thoroughly tested on an 108,000 ac. proving ground in Texas, and managed as the year closed, to play a decisive part in African operations, where it disposed of the erstwhile fearful 88-mm. anti-aircraft guns which Rommel had been using so successfully as anti-tank weapons. Different calibres developed, the larger mounted on caterpillar "half-tracks" (combination wheeled and tracklaying vehicles) included the 37 mm. on ¾ ton all-wheeled Fargo tracks, 75 mm. and 3 in. high-velocity types, and a 105 mm. In December it was announced that the half-tracks could be replaced with endless treads (tracks) of rubber with steel cables and cross-pieces embedded, at a saving of 200 lbs. of rubber per vehicle (as against tires) and with material reduction of noise and vibration. Meanwhile reports that Germany had a 47 mm. self-propelled anti-tank weapon remained unconfirmed.

Mechanical marvel of the year was a 28/20-mm. German anti-tank gun used in Africa. Firing a skirt-bearing shell of 28 mm. which, passing through a cone-shaped bore, emerged from the muzzle at about 5,000 f.s. with skirts collapsed into its body and its diameter thus reduced to 20 mm., it possessed terrific energy and was consequently capable of great penetration for so small a calibre (about .80). An adaptation of a German principle developed in the Holger rifle of the 1920s and 1930s, it produced effects quite out of proportion to its modest size.

Artillery—Coast, Field, Railway.—Britain having learned a bitter lesson in Africa, was replacing her old 18 pounder (83.7-mm.) field gun with a 25 pounder of 88-mm. calibre as the organic weapon of light field artillery regiments in her infantry divisions. Provided with a circular track to be laid beneath it on the ground selected for its emplacement, and upon which it would speedily be rotated in azimuth when in firing position, it was susceptible of being either horse or tractor drawn.

Germany had introduced a bouncing artillery bomb, fired apparently from a large-calibre field gun. One such was observed to explode five successive times, travelling in a relatively straight line after each graze. Tales of German super-guns, with bores 26-in. or more in diameter, used to reduce Crimean fortresses, were discounted by those familiar with the limited strength of European highway and railway bridges, narrow tunnel clearances, etc., which appeared to make wholly impracticable the transport of such monstrous pieces. Others who recalled the "Paris gun" of 1918, kept open minds on the subject. Russia continued the mechanization of her field artillery, even her 115-mm. guns now having their own motor carriages.

America's new 105 mm. howitzer battery required to operate it only slightly more than one-half as many men as had the old 75 mm. horse-drawn type, and one-tenth as many trucks as the "75" had had horses. With a traverse almost eight times that of the old 75, the 105 though actually lighter than the smaller gun with its limber, fired a shell that was twice as heavy and was drawn by a truck weighing little, if any, more than did the six horses which had pulled the older piece. But it cost twice as much! Russia was using a 203-mm. (8-in.) howitzer, transported in two loads, the carriage on a broad caterpillar track, the tube on a 6-wheeled carriage. Both were drawn by caterpillar tractors on which the crew rode. Russian field artillery included various models in calibres of 76.2, 107, 122 and 152 mm.

American field artillery now embraced organic slow-flying aircraft for short-range spotting purposes. Known as "grasshoppers" and piloted by field artillery personnel, their slow landing speed permitted landing on any short, level space. For long-range spotting, high-speed combat planes were still employed. Various U.S. field artillery units had been converted into armoured units with self-propelled 105-mm. howitzers mounted on medium tank chassis which carried .50-cal. machine guns additionally.

Sensation of the year were the light-weight Japanese rocket-cannon used for the first time in the battle of Singapore. Fr simply constructed and supported frames, shells possessed of gre explosive effect were fired on the rocket principle.

Bombing.—Before 1942 ended, air bombing was being co ducted on the grand scale, as witness Britain's repeated 1,0 plane raids over Germany and her air assaults on various Itali cities with 8,000-lb. "block buster" bombs. While these affect chiefly morale, apart from directly impairing production of matériel, navy bombing had more immediate military results was witnessed by the serious losses as a result of air action combat vessels in almost all categories by each of the ma nations engaged in the conflict.

Communications.—Tests to determine safe methods of "laun ing" carrier pigeons from aircraft showed that these birds co be released at altitudes up to 10,000 ft. without special devi of any kind. Above that height, it was found necessary to encl them in "bombs" of canvas-covered wire, set to open at any sired instant during descent, if their safe arrival at destinati was to be assured.

Ordnance and Motor Transport.—The U.S. Ordnance depa ment was made responsible during 1942 for motor transport p curement and maintenance—formerly functions of the quart master corps. This necessitated considerable expansion of activities. By way of maintenance, for example, it develope mobile maintenance company which composed 26 motor vehic plus a 10-ton wrecker capable of handling the heaviest equipme In addition to the automotive section it included an artillery s tion capable of repairing guns up to and including the 155-m howitzer, and an instrument section, concerned with maintena of watches, field glasses, etc.

By way of new motor transport matériel the U.S. had a 30 truck-trailer comprising three platforms, pyramided for qu loading and unloading and capable of transporting 206 soldi with their individual equipment over 300 mi. a day. In one swoop, the U.S. army purchased (Aug. 1942) 880,000 trucks a trailers of various types under 64 separate contracts with manufacturers, at a total cost of over $1,500,000,000. To conse steel the majority of these were to have wooden bodies (exc for items designed for use in the tropics). Such steel savi which had begun as early as April, were estimated to total 75, tons in 1942, 350,000 in 1943. A new tire with soft crepe rub tread had been designed for use on snow and ice.

Engineer Activities.—Outstanding engineer feat of 1942 the completion, in November, of the 1,600 mi. Alcan highw designed to link the U.S. with Alaska via Canada. Beginning March, and working in temperatures as low as 35° below zero, as high as 90° above, 10,000 engineer soldiers and 2,000 civili had completed an average of 8 mi. daily during good weat working on 10-hour shifts for a full 7-day week. The comple road was 24 ft. wide between ditches and involved the bridg of some 200 streams.

Other of the engineers' manifold duties involved the laying anti-tank mine fields—and destroying those laid by the ene A typical anti-tank mine, Germany's IP-2 was 10½-in. in dia eter, 2¼-in. thick, and weighed 9 lb.—5 lb. of which were c tributed by its charge of TNT. (A large type, the "Tell weighed 19 lb., its TNT filling, 11 lb.) Indicative of the e mous numbers in which such mines were employed, a single fi 400x750 yd. in dimensions, sown with mines 1½ yd. apart, requi 5,000 of these for complete coverage.

A new German device involved the use of a small mine wh exploding, threw a larger one into the air. This then detona distributing lethal fragments to a distance of 100 yd.

Searchers used, to locate these deadly disks, steel rods carry electromagnetic circuits which produced a buzz in earphones w

hem when brought into contact with a hidden mine. In addi-
, the time-tried "poke and dig" method (of prodding the
ınd with a stick for solid objects beneath the surface) was
popular.

lavy.—The United States commenced to launch some of her
rbattleships (45,000 tons) which had been building. The
va" left the ways in August six months ahead of schedule, the
w Jersey" in December. Estimated to displace 52,000 tons
n fully loaded, their calculated speed was 30 knots but an
al speed of 35 was considered not improbable. With crews
,600 officers and men, length of 880 ft., beam of 108 ft. and
ght of 36 ft., armament included nine 16-in. 50-calibre guns;
ty 5-in.; sixteen 1.1-in. (in batteries of four) and 50 machine
. Each ship was said to carry four reconnaissance aeroplanes.
rage building time for U.S. naval vessels had now been
ced as follows:

Type of Ship	Old	New
tleships	42 mos.	36 mos.
riers	45 "	27.3 "
vy Cruisers	36.4 "	22.7 "
nt Cruisers	33.8 "	22.3 "
troyers	27.2 "	11.6 "
marines	21.2 "	11.5 "

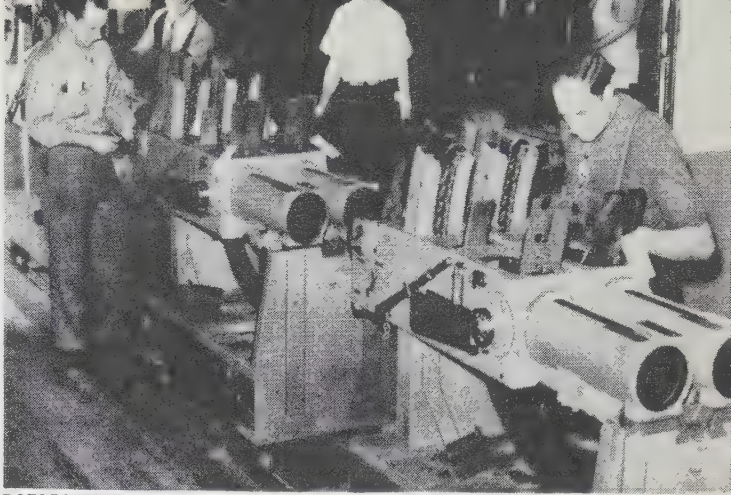
s of Nov. 1942, no less than 3,200 naval vessels (all types)
building for the U.S. navy—several hundred additional for
allies. A new type of escort vessel, the corvette, was begin-
to come into wide use in the North Atlantic. 170 ft. long,
armed with one 4-in. gun and several smaller pieces, plus
h charges, it was of simple design and easily constructed.
ada, which had entered the war with less than 20 naval ves-
all told, now had over 75 corvettes alone. As in the case of
army, naval building was spread among thousands of sub-
ractors. Thus one firm doing naval construction had over
subcontractors and suppliers in 180 communities in 25 states.

o November, Britain had lost 1,207 naval vessels, close to
0,000 tons, in three years of war. Included were 3 battleships,
rriers, 2 battle cruisers, 20 cruisers, 92 destroyers and 44
narines. But during the 30 months then terminating, Britain
turned out over 500 war vessels, and her net naval strength
ained undiminished. Of cargo carriers she had lost 731, but
regularly putting new ones into service within 40 days after
laying.

apan's losses in a year of war were estimated at 20% of the
naval tonnage. But she remained distinctly powerful at sea.
was said to be putting a new type of 7,500-ton carrier into
ice capable of disgorging from its sides 158 small craft, each
sporting a 3-ton tankette with 2-man crew.

aly was believed to have lost over 50% of her fighting fleet
Sept. 1942. Germany's losses were confined mostly to sub-
nes, but these still remained an ever-present danger in the
h and South Atlantic. France had scuttled most of the
aining fleet at Toulon, but a number of the vessels there
ted appeared salvable. Estimates indicated that while some
vere sunk, approximately 15, including 2 battleships, could
aved to Germany. Soon 26 additional French vessels, in vari-
African ports fell to the United Nations. Thus at Dakar
gained a 35,000-ton battleship, 3 cruisers, 1 large and 12
ll destroyers, etc., though in their North African invasion
were forced to damage or destroy various elements of the
ıch fleet which would have been theirs but for the decision of
French high command to offer resistance.

ore scientific stowage of cargo in loading at American ports
resulting in departures with holds 90% full—as against 50%
in 1941. Britain had lost 731 merchant vessels in the first
nonths of the war, but was replacing these steadily with new



BOFORS 40-mm. anti-aircraft guns being manufactured in Detroit for the U.S. navy in 1942

units commissioned on an average of 40 days after keel-laying. Germany's merchant fleet had been swept from the seas. Of Italy's, two-thirds lay at the bottom of the ocean, of Japan's, one-fifth. (*See* also NAVIES OF THE WORLD.)

Supply of Troops (Quartermaster corps, etc.).—As 1942 ended, supply services of the U.S. army found it necessary to accumulate over 700,000 distinct items of supplies and equipment in preparation for the North African invasion, with each U.S. soldier in the field requiring some 40 lb. of supplies daily to keep him in action. By way of furnishing part of the food element of this, the quartermaster corps was sending, in 1942, the dehydrated equivalent of over 400,000,000 lb. of potatoes overseas for American soldiers and sailors and for lend-lease purposes. Of frozen vegetables, U.S. overseas forces were estimated to require some 71,000,000 lb. in 1943. The soldier was, like the civilian, feeling the pinch of coffee rationing, with the ingredients for two of the three cups of that beverage formerly included in his emergency ration now replaced by chocolate and lemon juice. To offset this in part, mechanized and motorized forces were now enjoying a "5-in-1" canned ration which included good old American ham and eggs, each package containing enough of these and other dishes to make three full meals for five men for one day—prepared in five minutes by heating.

For use of sky troops and paratroops the quartermaster department was supplying small individual stoves, weighing under 2 lb., to be strapped to the uniform. These burned gasoline and operated for 2 to 3 hrs. on a single filling. In cold regions, soldiers were being issued paper underwear to use as extra insulation under regular clothing and discarded after one wearing. For hot regions, knee-length trousers of cotton khaki were being supplied, together with knee-length socks, half cotton, half wool, to be worn with these.

Raw Materials (Salvage, etc.).—The United States was still desperate for new rubber, of which her consumption was 600,000 tons annually, but enough for military needs at least appeared to be in sight under the program for the manufacture of synthetic substitutes (and enough for all needs, civil and military, by the end of 1944), with sufficient reclaimed stock to care for civilian requirements throughout 1943 and into 1944. Steel and other important metals were being made available by scrap drives, by the substitution of other materials for these when possible, and by revising manufacturing methods to permit the use of less metal per finished unit. Thus by the use of weldings in place of castings, solid forgings, etc., it was estimated that 7,000,000 tons of steel and 153,000,000 man-hours could be released annually. Revised manufacturing processes, mentioned above, resulted in steadily mounting savings, as did the use of substitute materials. Thus the substitution of plastics for aluminum in trench mortar fuses was estimated as due to effect the saving of 35,000,000 lb.

of that metal by the end of 1943.

A new process for the extraction of vanadium which would assure the United States an adequate supply of this scarce mineral, was announced in September. Electrolytic tin-plate and bonderized black plate for cans were scheduled to replace the former hot-dipped tin plating, since only one-half the amount of tin used for plating cans in 1942 would be available in 1943. Artillery shell cases, so long one of the main sources of brass consumption, were now being made successfully, and in any quantity desired, of steel, with enormous savings in brass resulting.

Infantry Weapons.—Little that was new in infantry armament appeared in 1942. Of pre-existing types, the submachine gun and machine pistols with skeleton stocks proved their worth for close fighting whether in jungle or city street. The Russians were said to be using a "sub"-gun which outclassed that of their German adversaries. This had a 70-round magazine and was effective at 200 yd., as against a German piece with 35-round magazine effective to 100 yd. only.

Submarines.—As the year ended, it was realized that the submarine menace was far from solution. Germany was building these vessels, newer, stronger, deeper-diving than before, and said to be equipped with an improved underwater communication system, at a rate estimated at 25 monthly; her losses were probably not over half as many. Sinkings of United Nations merchant shipping were now approximating the dangerous figure of 1,000,000 tons a month. Within their limited action ranges, blimps could spot and bomb the undersea raiders, while escort vessels in sufficient numbers could fight off attacks on convoys. But sufficient numbers did not exist, and could not for some time to come. (*See* also SUBMARINE WARFARE.)

Tanks and Combat Cars.—Germany's Mark IV tank, the backbone of Rommel's Afrika corps, weighed 22 tons and had a speed of 22 m.p.h. Armed with a short 75-mm. cannon (some with a high-velocity 50-mm. gun), it proved vulnerable to the more powerful 75-mm. gun of the American General Grant, and was markedly inferior to the later General Sherman.

But America's Grants and Shermans while able to penetrate German tank armour were themselves vulnerable to the 88 mm. anti-aircraft, all-purpose gun which Rommel used against them. Hence it became necessary for American tanks to outmaneuvre rather than outfight this piece until the U.S. MVII "tank killer," mounting a 105-mm. howitzer on the standard MIII tank chassis, became available. And since the 88 mm. had to be immobilized for emplacement, such a procedure was sometimes not too difficult. Medium tanks, consuming as they did one gallon of gasoline per mile, constituted a supply problem in themselves, each requiring the individual services of a 1,000-gallon supply truck whenever it undertook long-range desert operations.

Japan was using four classes of tanks, viz.:

1. Tankettes of various types, weight, 3 to 4 tons.
2. Light tanks, weight 5 to 7.7 tons.
3. Medium tanks with 37 mm. and 47 mm. guns; weight (heaviest) 15 tons.
4. Heavy tanks, weight 35 and 36 tons.

Transportation, Railway.—The U.S. activated, in November, a transportation corps to operate her military railroads—formerly one of the tasks of the corps of engineers. Germany's railway prime movers were suffering from attrition due to allied strafing plus inadequate repairs and replacements, as evidenced by the fact that her locomotive factories were now accorded the same priorities on scarce metals as were tank plants.

Lend-Lease.—During the year ending Dec. 1, 1942, the U.S. and Britain sent to Russia, by the northern route alone, over 3,000 aircraft, 4,000 tanks, 30,000 trucks and other motor vehic plus 800,000 tons of ammunition, food and raw materials. C sidering *all* routes, the U.S. alone had sent Russia 2,500,000 t of war materials over this period.

Murphy, Robert Daniel (1894–   ), U.S. foreign serv official, was born Oct. 28 Milwaukee. He entered the foreign service in 1917 as a cl in the Berne legation and held consular posts in Zurich, Mun and Seville until 1930, when he was transferred to the Pa embassy as consul and later first secretary. After the colla of French armies in June 1940, he followed the Pétain governm to Vichy, there becoming a counsellor in the U.S. embassy a chief U.S. representative in French North Africa. Murphy credited with having played an important role in preparing groundwork for the U.S. invasion of French North Africa Nov. 1942. Because of his wide acquaintance among Vi French officials, he succeeded in getting 40 U.S. vice-cons into North Africa. These consular agents regularly relayed v military and political information to Washington. Murph friendship with French officials of pro-allied sentiments thus hel pave the way for the U.S. occupation at low cost in casualt He sat in with Maj. Gen. Charles W. Ryder during the nego tions that resulted in the surrender of Algiers, Nov. 8, 19 Murphy was given the D.S.M. for his work in North Africa a received the rank of minister from President Roosevelt.

Murray, Philip (1886–   ), U.S. labour leader. A nat of Scotland, he was born in Blantyre May 2 and emigrated to the United States in 1902. Naturalized in 19 he became a member of the international board of the Uni Mine Workers of America the next year, president of the unio fifth district in 1916, and international vice-president in 19 During World War I he was a member of Pennsylvania's regio war labour board and served also on the National Bitumin Coal Production committee. In 1935 he was named to the N tional Industrial Recovery board and to the advisory council the National Recovery administration. Murray was John L. Lew choice for second president of the C.I.O. after Lewis had fulfil his pre-election promise of 1940 to resign if President Roosev was elected for a third term. Lewis, who continued to domin the annual convention of the organization, personally nomina Murray, and the latter was elected unanimously Nov. 22, 19 Murray, however, did not follow Lewis in his bitter opposit to Roosevelt's foreign policy. Although a split between the labour chieftains was evident, Lewis' supporters neverthe joined other C.I.O. factions in re-electing Murray as presid in Nov. 1941. The split became an open break in May 19 when Lewis summarily ousted Murray as vice-president of U.M.W.A. Murray responded by accusing Lewis of trying undermine the C.I.O. Lewis counterattacked in Oct. 1942 marching his United Mine Workers out of the C.I.O. In summer of 1942 Murray meanwhile renewed his efforts to est lish industry councils on which management, labour and gove ment would be equally represented; he frequently criticized "monopoly" of management representatives on federal war p duction agencies.

Museums of Art: *see* ART GALLERIES AND ART MUSEUMS.

sic. A striking fact stands out in the musical events of the year 1942: the big news of that year was a new com- ion by a living composer. Dmitri Shostakovich, with the position of his *Seventh Symphony,* achieved more news space any composer of previous years. Perhaps the composer it find encouragement in this fact, for it revealed a closer act between the creative artist and the public and it also aled the propaganda value of the composer's work. Shos- vich completed this latest symphony Dec. 27, during the siege eningrad. Its first performance in Russia was given by the hoi Theatre orchestra. It was then sent to America on micro- travelling through enemy lines, across Persia, Egypt, and the Atlantic for its first performance in New York city by NBC Symphony orchestra under Arturo Toscanini July 19. r this first performance, the work was heard frequently over radio and on the concert stage performed by most of the r orchestras of the United States. There was some disagree- in America concerning the intrinsic worth of the new com- ion. Some critics found the work undistinguished in its style; s, on the other hand, found the style simple rather than l; most people, however, found the 70 minutes of the work le long. Shostakovich said: "The symphony is devoted to events of 1941—war. This does not mean, of course, that it a naturalistic imitation of the war, but nevertheless, it is an pretation of the war."

usical events of 1941 and 1942 were obviously greatly influ- l in all countries by the global war. All events of 1942 were nated by this conflict. The entry of the United States into war loosed new demands upon the musician, demands that tably arise when a nation is involved in a bitter struggle. The news came from all countries. From England, Stanley er, secretary of the Music Teachers' association wrote:

> re is a widespread demand from workers in our industrial areas for or- al concerts, and the call from the forces is such that each of the dis- commands now has its own divisional orchestra under the conductor- of one or other of our well-known conductors. Male voice choirs and choirs are to be found everywhere in the forces where a practising ian has turned up in uniform.*

y Dickinson Welch, heading the radio and concert programs erned with bond sales from the treasury department in Wash- n, encouraged musical activity of all sorts and in all com- ties throughout the country.

hile the musical activity of England, Russia, France, Ger- and Italy must be considered largely in terms that related e war and the way in which the war affected those nations, rtheless, one must not assume that there was no concert life normal sort. Indeed, the continuing of normal concert life bolster to public morale was the policy of most foreign nments. In Russia and Germany alone did this policy seem ad to the encouragement of new creative personalities. Ger- opera houses continued to be crowded, from all reports, h the musical fare was largely Richard Wagner. It was bered within the reich that if Wagner's music could live igh this period of "forced feeding" he was indeed a great poser. Efforts to create masterworks by propaganda methods not as successful in Germany, however, as in Russia, since ew and striking figures arose from the efforts. Werner Egk ed unable to gain any very great acclaim in the reich or the ory controlled by Germany. A new name, however, emerged ienna—Eugen Suchon, a 28-year-old Slovakian. His work being sponsored by the Universal Edition. In France, Fauré's c was considered by the forces of occupation to be most ex- ive of the French spirit. Alfred Cortot, Arthur Honegger, cis Poulenc, Hoeree, Sauguet, Delannoy, to mention but a names, joined with the Vichy efforts of collaboration.

There were so many composers living and writing in the western hemisphere that no report could cover adequately the events of 1942 in that part of the world. Opera and concert recitals continued with prewar monotony. There were some few exceptions, however. Several new operas were given their first performances: *Solomon and Balkis* by Randall Thompson was heard over the radio and presented April 14 at Harvard university; *A Tree on the Plain* by Ernst Bacon was given May 1 at Converse college. Both of these works were commissioned by the League of Composers. Gian-Carlo Menotti's *Island God* was staged by the Metropolitan Opera company in New York city. *Kabelia* by Eduardo Sanchez de Fuentez was heard June 22 in Havana, Cuba. *Tucuman* by Felipe Boero was presented Jan. 20 at the Theatro Colon in Buenos Aires.

Symphony orchestras, chamber music groups, colleges, schools and the radio were responsible for the largest part of musical activity in the United States. As a result new names appeared more frequently on programs. The hope of Argentine music was young Alberto Ginastera who was awarded a Guggenheim fellowship for work in the United States. The 35-year-old Brazilian composer, Camargo Guarnieri, began to attract the attention of the outside world. The composer of the United States who gained, perhaps, the most stature in 1942 was William Schuman whose *Third Symphony* (Boston) and *Fourth Symphony* (Cleveland) both received marked acclaim. New symphonies were heard by David Diamond (New York Philharmonic), Virgil Thomson (Philadelphia), Pvt. Robert E. Ward (Julliard Publication), Paul

A MEMORABLE MUSICAL EVENT was the NBC Symphony orchestra's broadcast July 19, 1942, of Dmitri Shostakovich's seventh symphony, written during the siege of Leningrad. Shostakovich is shown here (right) as a member of Leningrad's fire fighters

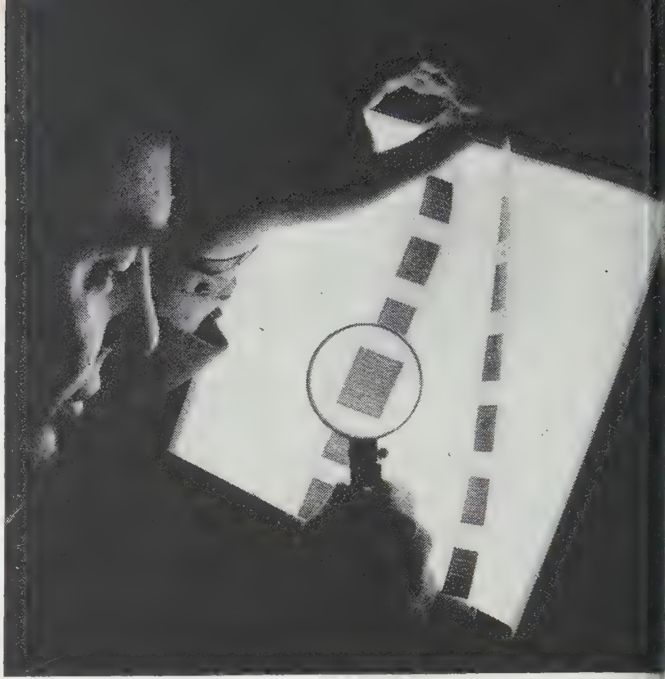
inted by permission from the Music Teachers National Association *Volume of* *lings* for 1941.

Hindemith's *Symphony in E* (New York Philharmonic), Bohuslav Martinu's *First Symphony* (Boston), Richard Mohaupt (New York Philharmonic) and Alexander Gretchaninoff (New York Philharmonic). Violin concerti by Samuel Barber (Boston) and Nicolai Lopatnikoff (Boston) and piano concerti by Darius Milhaud (Chicago), Carlos Chavez (New York Philharmonic), Stanley Bates, Guggenheim award for 1942 (New York City symphony), Karol Rathaus (I.S.C.M. concerts, Berkeley, Calif.) added interest to symphonic concerts. Many smaller orchestral works were performed, many of which were perhaps more representative of their composers than the larger symphonies. *Bataan* by MacDonald—a tribute to Gen. Douglas MacArthur (Washington) and *Plain-Chant for America* by Wm. Grant Still were works that revealed the efforts of composers to meet the demands for timely scores. Works like Ernst Krenek's *Variations on I Wonder As I Wander* (New York Philharmonic) and Jaromir Weinberger's *Lincoln Symphony* (New York Philharmonic) showed the attempt, perhaps futile, of the newly arrived exile to find American roots. (R. L. Fy.)

Popular Music.—The year 1942 will go down in the history of popular music as Irving Berlin's personal property. His "White Christmas" brought back memories of the old days by selling more than 1,000,000 copies, the first time this had happened in many years. This song also led the Lucky Strike Hit Parade with nine appearances in first place, and was going stronger than ever as the year closed.

Berlin had two other songs in the Hit Parade, "Be Careful, It's My Heart" and "I Left My Heart at the Stage Door Canteen." His entire score of the soldier show, *This Is the Army,* made a real impression, as did that of his film, *Holiday Inn.* In addition, "God Bless America" continued to be recognized as an unofficial national anthem.

OLIVER WALLACE, composer of "Der Fuehrer's Face," which, like "Praise the Lord and Pass the Ammunition," was a popular U.S. war song of 1942



THE SCORE OF DMITRI SHOSTAKOVICH'S seventh symphony, written u fire during the siege of Leningrad, was photographed on microfilm and sent train, motor car and plane to the U.S. for the special NBC broadcast of July 1942, conducted by Arturo Toscanini. When enlarged, the score was 252 p long

There was a great gap between "White Christmas" and its ne est competitor in the sales of sheet music. "The White Cliffs Dover," which had monopolized attention in the closing weeks 1941, reached a sale of close to 600,000 in 1942 and topped *Hit Parade* six times. Third place went to the war nove "Praise the Lord and Pass the Ammunition."

Statistics compiled by *Variety,* the bible of show business, g the obscure hillbilly number, "There's a Star Spangled Bar Waving Somewhere," fourth place in sheet music sales and honour of being the surprise of the year. Fifth place went "When the Lights Go on Again," which carries on the mood the popular "White Cliffs of Dover."

With ASCAP music back on the air, the year as a whole i cated a return to the traditional "plugging" routine, whereb hit could be maintained over a period of perhaps three mo and then allowed to die a natural death. The song appearing n often in the *Hit Parade* was "Sleepy Lagoon," with 17 perfo ances (twice in first place). "Johnny Doughboy Found a F in Ireland" appeared 16 times, with 14 performances each "Jersey Bounce," "One Dozen Roses," "Jingle Jangle Jing "He Wears a Pair of Silver Wings" and "My Devotion."

Popular with the armed forces was "Don't Sit under the A Tree," an adaptation of the old "Long, Long Ago," and this cellent "gang song" topped the *Hit Parade* five times. "Dee the Heart of Texas" made the same score, as did "Jingle Ja Jingle," a burlesque of cowboy ditties which turned out to serious success.

Other songs figuring prominently in the *Hit Parade,* as we in the sale of records and sheet music, were the waltz, "E O'Day" (going back to "Round Her Neck She Wears a Ye Ribbon"); "Blues in the Night," a successful imitation of recognized type of American folk music; "Somebody Els Taking My Place" and "Skylark." A vocal version of the ins mental *Manhattan Serenade* attained popularity toward the c of the year, as did Jerome Kern's "Dearly Beloved" and a j novelty called "Mister Five by Five." Mussolini, Benito

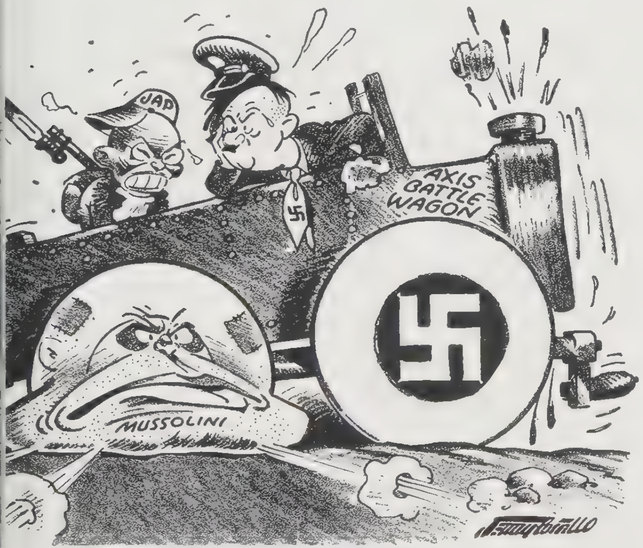
(1883–), Italian statesman and tator. For his earlier career, see *pædia Britannica.* Il Duce chose June 10, 1940, as the pro- us date for entering World War II, doing so with the declara- that "our conscience is entirely clear." After a few desultory ts at defeated France he consulted with Hitler at Munich 18 on the terms of peace. Italian military activities then ined in relative abeyance until the beginning of the cam- s in North Africa (Sept. 12, 1940) and in Greece (Oct. 28). these operations were soon thrown into reverse, and on Dec. 40, Mussolini reorganized his military command.

e events of Mussolini's career in 1941 fell into the same al pattern first set in 1940: conferences with Hitler; shake- of the army; explanations of defeats; and threats against common enemies of the axis. In June 1941 he assured his e that U.S. intervention would not alter the outcome of the

ter Italy had entered the war against the U.S.S.R., Mussolini a visit to the Russian front where, in late August, he held er five-day conference with Hitler.

ring 1942 Mussolini's prestige and popularity among the n people continued to dwindle. On April 30 he conferred with Hitler near Salzburg, and an announcement said they reached the usual "unity of views and decisions." It was understood, however, that Hitler had reached the "decisions" Il Duce was compelled to agree. After the R.A.F. had cted Milan, Turin and Genoa to their worst bombings, n morale slumped dangerously. Il Duce recognized this ening of spirit in a speech delivered Dec. 2, 1942, when he



"FLAT TIRE" of the axis battlewagon, as pictured in 1942 by Costello of *ickerbocker News* (Albany, N.Y.)

ed Italians for spreading "silly stories and gossip." He also red that if Italy gave up, "it would renounce forever its of being a great nation." (*See* also Italy.)

t, Condé

(1874–1942), U.S. publisher, was born March 26 in New York city. He was a graduate of getown university and received a law degree from Wash- n university, St. Louis, in 1898. He forsook law to become tising director for *Collier's* magazine, and in a few years ok charge of its business administration. Nast ventured into tern business of his own and in 1907 left *Collier's* to ex- his own company. Two years later, he purchased *Vogue* , under his guidance, became a fashion guide for the nation's "smart set." He also published English, French and Argentine versions of this magazine. He subsequently acquired *Vanity Fair,* which he merged with *Vogue* in 1935, and other magazines. Nast died in New York city, Sept. 19.

National Academy of Sciences.

The National Academy of Sciences was incorporated by act of congress in 1863 for the purpose of investigating, examining, experimenting and reporting upon any subject of science or art whenever called upon by any department of the United States government. Reports on such work are made directly to the government department or agency which requested the advice, and the question of whether or not the reports shall be published, and their distribution if published, is entirely in the hands of that department or agency.

Membership in the academy is by election in recognition of outstanding achievements in scientific research, and is limited to 350 active members and 50 foreign associates. Members must be citizens of the United States. New members are elected by the academy on nominations from its 11 sections: mathematics, astronomy, physics, engineering, chemistry, geology, botany, zoology and anatomy, physiology and biochemistry, pathology and bacteriology, and anthropology and psychology.

The academy holds an annual meeting and an autumn meeting each year. In 1942 both meetings were held in the Academy building, Washington, D.C.—the annual meeting on April 27 and 28, and the autumn meeting on Oct. 26. Because of the war, no scientific sessions were held; only business sessions for the consideration of reports of officers and committees, and general business of the academy.

Sixteen new members were elected at the annual meeting: Homer Burton Adkins, Lyman James Briggs, Hans Thacher Clarke, Ralph Erskine Cleland, Charles Haskell Danforth, Albert Einstein, Conrad Arnold Elvehjem, Michael Heidelberger, John Gamble Kirkwood, Paul Dyer Merica, Thomas Midgley, Jr., Francis Dominic Murnaghan, John Torrence Tate, Alfred Marston Tozzer, Ernest Edward Tyzzer, and Selman Abraham Waksman. One additional foreign associate was elected by the academy at the annual meeting: Robert K. S. Lim, of the Peiping Union Medical college, Peiping, China.

The Mary Clark Thompson medal was awarded to Sir Arthur Smith Woodward, distinguished British palaeontologist, in recognition of his services to geology and palaeontology on both sides of the Atlantic.

The academy publishes an annual report, biographical memoirs of its deceased members, occasional scientific memoirs, and monthly *Proceedings.*

The officers of the academy in 1942 were: Frank B. Jewett, president; Isaiah Bowman, vice-president; W. B. Cannon, foreign secretary; F. E. Wright, home secretary; J. C. Hunsaker, treasurer, and Paul Brockett, executive secretary.

The Academy building, at 2101 Constitution avenue, Washington, D.C., was closed to the public for the duration of the war. The scientific exhibits on the first floor, which formerly attracted thousands of visitors to the building annually, were removed some time ago so that the exhibit rooms could be converted to use as offices by various committees working on scientific advice to the government. (P. Bt.)

National Association of Manufacturers.

The N.A.M. was organized in 1895 for the purpose of advancing the industrial and commercial interests of the United States, for promoting and protecting both employer and employee, and for the support of private enterprise politically. Membership, open to organizations and individuals engaged in manufacturing, reached 8,000 during 1942. Dues are based on capitalization and are spent entirely on association projects. In addition to a law department, devoted exclusively to legislative matters pertinent to business interests, the association in 1942 maintained advisory boards and standing committees for the information and assistance of members on such topics as: co-operation with agriculture, church and educational institutions; public and national industrial relations; war and postwar problems; economic stabilization and security; price control; patents and research; and government finance. In 1942 the public relations program was the most extensive ever undertaken by organized industry; it publicized the association through many mediums. F. C. Crawford, president of Thompson Products, Inc., Cleveland, was elected national president at the convention in Dec. 1942. Other officers were: Executive vice-president, Walter B. Weisenburger; secretary, Noel Sargent. Headquarters: 14 West 49th Street, New York city. Branch offices: Investment Building, Washington, D.C.; 111 Sutter Street, San Francisco, California. (N. S.)

National Debts.

The national debt of a country generally refers to the total financial obligations of the state arising out of the issuance of public securities. It does not include the debt of all governmental units and agencies but only the obligations of the central government. The national debt usually indicates the extent to which the central government has resorted to borrowing over the years to make up the deficit between its outlays for government services and investment and its revenues from taxation and various minor sources. As the manner of keeping official accounts varies from country to country, however, there are many exceptions to this definition. On the one hand, agencies or corporations of the central government are sometimes set up outside the budget so that their debt does not appear in the national debt. On the other hand, obligations are sometimes assumed by the government and included in the official national debt statistics which did not originate in a borrowing operation. The adjusted service bonds issued to veterans are an example of this type of obligation included in the national debt total of the United States.

The course of the national debt in the United States since 1913 is shown in Table I. The debt first reached substantial proportions during World War I, with a peak of over $25,000,000,000 at the end of the fiscal year 1919. During the following decade, about one-third of the debt was liquidated. With the onset of the world-wide depression in 1929 and the subsequent use of government expenditures as a method of fighting economic depression, the debt expanded rapidly throughout the 1930s to reach almost $33,000,000,000 at the end of the fiscal year 1940.

It was after 1933 that various government corporations operating outside the budget first came into prominence. The most important were the Federal Farm Mortgage corporation, the Commodity Credit corporation, the Home Owners' Loan corporation and the Reconstruction Finance corporation. The securities of these corporations were not issued by the treasury and were not included in the statutory public debt, but the obligations were guaranteed by the federal government both as to principal and interest. By the end of the fiscal year 1940 the total securities outstanding guaranteed by the United States were $5,529,000,000.

Source: Data from 1913 to 1942 are from U.S. treasury department, daily treasury ment (revised); 1943 estimate reported in budget of the United States g ment for the fiscal year ending June 30, 1944 as presented to the congr President Roosevelt. E=Estimated.

The history of the United States debt entered a new p with the inauguration of the national defense program in middle of 1940. Although new tax measures increased gov ment revenues substantially, the scale of the armament exp tures was soon so vast that tremendous increases in the nat debt were inevitable. Arguments against increasing the ceased in the face of the sheer economic impossibility of finan the huge rearmament program on a pay-as-you-go basis. Du the year and a half of the national defense program, the nat debt rose approximately $15,000,000,000 to a total of $57, 000,000 at the end of the calendar year 1941.

The transformation of the rearmament program to a full effort in the course of 1942 resulted in a further tremen increase in government expenditures. Taxes were raised subs tially but could not keep pace with the flood of expenditure that a much faster increase in the national debt was neces During 1942 the public debt outstanding rose by approxima $50,000,000,000, reaching a figure of $108,170,000,000 at the of the year.

In order to curb the inflationary pressure of the huge vo of government borrowing as the economic system approa closer and closer to capacity operations, the treasury endeavo to increase the savings of the public through the sale of U States savings bonds, a non-marketable type of security. savings bond campaign was considerably expanded after the break of war and an effort was made to get wage and s workers to subscribe 10% of their earnings to war bond chases, the subscriptions to be deducted at the source. By m of this vast campaign an increase of about $9,000,000,000 in savings bonds outstanding was achieved in 1942. The cam received the enthusiastic support of the screen, press and r as well as of organizations and public figures of all sorts.

In his budget message for the fiscal year 1944, President R velt pointed out the necessity for further debt increases to fin the gigantic war program of $100,000,000,000 called for in budget. He further made it clear that he was relying upon ministrative rather than upon fiscal controls to curb infla

hough the two types of controls were interrelated.

The president estimated that the public debt would be $135,0,000,000 at the end of the fiscal year 1943. If his war program the fiscal year 1944 were achieved, the debt by the end of at period would be $210,000,000,000. That estimate was based on existing tax legislation, however, and the president recommended higher taxes which would hold the debt to a somewhat ver figure.

One of the most interesting aspects of public debt financing in orld War II was the successful attempt by the treasury up the close of 1942 to maintain a low interest rate policy. Inest rates were held at a point only moderately higher than ring the depression of the 1930s, the highest rate for long term rket issues in 1942 being 2.5%. The average rate of interest the outstanding debt in 1942 was 2.09% whereas the average e in 1919 was 4.17%. Firm control over the financial system de it possible to finance the war more cheaply than any preus war in United States history.

Due to the huge increase in the national debt, however, total erest charges were rising sharply. Interest on the public debt reased from slightly more than $1,000,000,000 in the fiscal ar 1940 to $1,260,000,000 in 1942. It was estimated that inest charges would rise to $1,850,000,000 in the fiscal year 13 and to $3,000,000,000 the following year.

State and Local Government Debt.—The figures on the debt state and local governments, 1929–42, are shown in Table III. cause of the many government subdivisions in the United tes and the many functions of government which remain in hands of local government units, the state and local government debt in the United States has always been an important nponent of total government debt. It arose largely from the ancing of the various types of public works, although during period of declining economic activity from 1929–33 the ing-off of revenues and increasing expenditures for relief led to the debt total. From 1933 on state and local debt ied little, as the federal government took over the major rden of relief and also financed much of the public works of te and local governments. During 1941 and 1942 state and al debt declined slightly as government revenues increased h the rising tide of national income and as scarcity of maials has tended to limit public works expenditures.

Other Countries.—Latest figures available for the national ot of the leading countries are given in Table IV. It should kept in mind that these debt figures are not comparable with h other because of differences in the division of responsibility ween national and local governments from country to country, ause of differences in size, wealth and population, and because differences in services rendered or investments made by government.

Insofar as changes in national debts are known, it is evident t war was causing large increases in debts as it had throughout history. The debt of the United Kingdom rose from £8,301,100,000 on March 31, 1939, to £14,070,000,000 at the end of the fiscal year 1942. Similar increases occurred in other British empire countries: Canada's debt increased from $3,638,300,000 in 1939 to $5,866,000,000 in 1942, while the Australian debt rose from £1,295,000,000 to £1,629,000,000 over the same period. National debts of the axis powers showed even greater increases. From 1939 to 1942 the debt of Germany increased from r.m.30,737,000,000 to r.m.142,000,000,000. The debt of Japan increased from 30,894,800,000 yen to 40,470,000,000 yen during the fiscal year 1942. At the end of the fiscal year 1939 the Japanese debt was 17,837,100,000 yen. National Education Association of the United States gave much attention during 1942 to the adjustment of the schools to new conditions created by the war. In co-operation with the U.S. Office of Education and other agencies it had committees at work on many phases of war effort and was in active contact with various branches of the government. Its educational policies commission issued a number of important statements including *A War Policy for American Schools* and *The Support of Education in Wartime.* Its commission on the defense of democracy through education held conferences throughout the United States in co-operation with the National Manufacturers association to bring about a better understanding between industry and the schools. Because of the war emergency the legislative commission intensified its campaign for federal aid for elementary and high schools. The association was instrumental in obtaining a three-cent flat postage rate on books and also an amendment to the Hatch act to remove an increasing threat to the freedom of teaching. American Education week was observed Nov. 8–14, 1942, around the theme, "Education for Free Men," and brought 10,000,000 citizens into their schools.

The association was organized in Philadelphia in 1857. It had, in 1942, a membership of 217,943 and its affiliated state associations had a membership of 804,684. The association's winter convention was held at San Francisco Feb. 21–26, 1942; its general convention in Denver June 27–July 2, 1942. The 1943 conventions were scheduled to be held in St. Louis in February and in Indianapolis in July.

The official organ is the *Journal of the NEA,* edited by Joy Elmer Morgan, and issued to all members monthly except June, July and August. The president for 1942–43 was A. C. Flora, superintendent of schools, Columbia, S.C.; executive secretary, Willard E. Givens. (*See* also EDUCATION.) (J. E. Mo.)

National Geographic Society.

Organized in 1888 by a small group of professional geographers resident in Washington, D.C., this society's purpose was set forth in its charter as that of "increasing and diffusing geographic knowledge." Gilbert Grosvenor, the president in 1942, assumed the direction of the organization's activities in 1899 and broadened the scope of its researches to appeal to the layman interested in scientific accomplishments. The membership of the society grew from fewer than 1,000 in 1899 to 1,250,000 in 1942.

In 1942 the society made a grant to Dr. Philip Drucker, Smithsonian institution, to continue his studies of the shards collected by the series of National Geographic Society-Smithsonian Institution archaeological expeditions at La Venta, state of Tabasco, Mexico. The expedition uncovered a large cache of jade artifacts of the La Venta culture. The society, in collaboration with the National Museum of Mexico, had a cast made of one of the giant human heads, sculptured in basalt, unearthed in Mexico in 1940 under the direction of Matthew W. Stirling. The heads, too large to be moved, were re-covered with earth to preserve them. A grant of $6,000 was made to Stirling to continue the excavations in 1943.

Foreign field trips made by members of the society's staff during 1942 included those of Dr. Maynard Owen Williams in India and Afghanistan, Howell Walker in Australia, W. Robert Moore in South America and the West Indies, and Frederick Simpich in Baja California.

Detailed surveys in the United States during 1942 included Leo A. Borah's careful study of the state of Kentucky, Gerard Hubbard's investigations of the Lake George-Lake Champlain area, Frederick Simpich's travels in the Pacific Northwest, La Verne Bradley's examination of the San Francisco bay region, and Albert W. Atwood's journey up the Connecticut river valley.

"American Industries Geared for War," a series of paintings made especially for the society and reproduced in colour in the *National Geographic Magazine,* accompanied Albert W. Atwood's study of "The Miracle of War Production." Metals, glass for war and peace, and shipbuilding were surveyed intensively during the year. The quartermaster corps, the coast guard, the navy's aircraft carriers, the blimps at the U.S. Naval station at Lakehur N.J., and the U.S. merchant marine were studied by staff me bers. Arthur Beaumont's paintings of the "Army on Maneuvers shown in colour in the *Geographic,* portrayed phases of mode warfare from ski troops to mounted cavalry.

Endeavouring to give every possible assistance to the gover ment in furthering the war effort, the society made available representatives of the armed forces and official agencies its c lection of more than 300,000 informative photographs, coveri every country in the world; its hundreds of unpublished man scripts; its library of reference works, and its storehouse cartographic data. One staff member, only American to acco pany the Citroën-Haardt expedition across Asia, from the Medit ranean to the Yellow sea by motor, supplied valuable data on po sible air and motor routes to China. Other staff men gave co parable advice to military planners.

The society prepared and issued as supplements to its offic publication, the *National Geographic Magazine,* five large-sca ten-colour maps, including the "Theatre of War in the Paci Ocean," "North America," "South America," "Theatre of War Europe, Africa and Western Asia," and "Asia and Adjace Areas." Made at the request of army air forces personnel, t "Theatre of War in Europe" was drawn to a scale of 237 m the approximate cruising speed of the average bomber, to o inch. The society's maps, enlarged to ceiling height, were plac in the navy's operational centres to show the location of eve unit in the fleets.

In addition to the large maps, the society published 37 c tailed black-and-white maps in the magazine during the year.

The society's news bulletin service, supplied upon their reque to some 550 newspapers, furnished geographic, historic and ec nomic backgrounds of the place names mentioned in war ne dispatches. A series of articles, each accompanied by an esp cially compiled newspaper map, surveyed the neighbour republ in Central and South America.

The *Geographic School Bulletin* was mailed to 30,000 teache each week of the school year to supplement geography textboo (G. GR.)

National Guard.

The opening of the year 1942 found t entire national guard of 52 states and t ritories in the federal service and merged into the army of t United States fulfilling their assigned missions. Many chang were made in types of national guard organizations remodell to conform to the more effective and modern pattern adopted the army. For example, national guard cavalry regiments we mechanized; anti-tank elements were withdrawn from artille units, and formed into tank destroyer battalions. Regimen bands were reassigned to posts and stations. Divisions were co verted from the so-called "square" divisions to the "triangula divisions. Air squadrons were reorganized and national gua pilots who were older and among the most skilled, due to civili experience, were transferred to more important positions.

Details of reorganization, or of assignments, cannot be pu lished for military reasons. Guardsmen were serving in every pa of the world on every battlefront. They distinguished themsel in the Philippines where the youngest of the U.S. coast artille units, the 200th coast artillery from New Mexico, earned t distinction of being the first national guard regiment cited as organization for exceptional service in battle.

The flag of the United States was first raised by Americ combat troops on the soil of Australia by a national guard re ment. These organizations were so padded with volunteers, floo ed with drafted increments, and supplemented with officer repla ments while the original personnel had been withdrawn to t k of training selectees and forming new task forces, that it was ficult to identify them as the national guard which entered into service beginning Sept. 15, 1940.

More than 20,000 promotions were earned by national guard cers, nearly 30 new brigadier generals being made from its sonnel, and two major generals commanding new divisions be- promoted from their officers. For the first time in history ervice command of the army was headed by a national guard cer (Major General Milton A. Reckord), and, also for the first ie, an important division of the general staff of the army was ded by a national guard officer (Brigadier General Miller G. iite), and many other highly important assignments were en- sted to these citizen soldiers.

n more than two-thirds of the states, the state adjutant gen- ls were directors of selective service activities, and approxi- tely 90% of the state selective service staffs were former guard cers who were trained for this specific assignment.

tate Guard.—With the induction into the federal military vice of the last units of the national guard on Oct. 6, 1941, the te guards, organized under a congressional amendment to tion 61 of the National Defense act, assumed far greater im- tance. The national guard bureau, as the war department's ad- iistrative agency for state guards, devoted practically all of its ention to the organization, equipment and training of these e guard units now existing in all states except Arizona, Mon- a, Nevada and Oklahoma. The number of state guards prac- lly doubled. There was considerable turn-over in both officers men because membership in these units did not exclude them n selective service and, in fact, in many cases enrollees in e guards joined their local units in order to get preliminary ning which might hasten their advancement upon induction.

Many of the officers were reserve officers awaiting order into ive service. This turn-over of personnel necessitated an in- se training program. Special schools were established in prac- lly all of the service commands. Many states set up officer ools in which instruction was given by army officers in the lat- tactical methods employed and in guerrilla warfare.

he state guards not only were in 1942 a strong defensive e, but contributed much to their states during domestic emer- cies and sudden disasters due to natural causes.

he probable employment of state guards was clarified by the department's announced statement of principles covering ning and missions on April 30, 1942, as follows:

> tate guards remain state forces for use within the boundaries of their states, but their functions have been fitted into a broad pattern for home defense of the nation, and service commanders are asked to arrange hey may be assigned appropriate emergency missions.
>
> he mission of state guards is to provide an adequate, trained force for loyment within the boundaries and jurisdiction of their states, as di- ed by the state executive and legislature. The state guards are expected, er normal circumstances, to be used for the benefit of the state to meet estic emergencies from war or other causes, and to guard and protect l industries, installations, communications and facilities when local ce and civil guards are deemed inadequate. In addition, the state rds may be expected to assist military police and other units of the army, uppress the efforts of enemy agents, such as organized fifth column ips and parachute troops, and to co-operate with federal military iorities in extreme emergencies especially in the evacuation of civilians in information and observation duty at, or near frontiers.
>
> he war department, through the national guard bureau and service manders, has circulated to the various state guard authorities suggested iing programs to standardize progressive and balanced training.

(J. F. Ws.)

tional Housing Agency. The National Housing agency was created by the sident on Feb. 24, 1942. Employing the powers vested in him the First War Powers act, 1941, the president issued Execu- Order 9070 consolidating into the National Housing agency housing functions and activities formerly carried on by the owing agencies: the Federal Housing administration, the Federal Home Loan Bank board, the Federal Home Loan Bank system, the Federal Savings and Loan Insurance corporation, the United States Housing authority, the Defense Homes corporation, the Federal Works agency, the Public Buildings administration, the Division of Defense Housing and the Mutual Ownership Defense Housing division in the Federal Works agency, the War and Navy departments (except for buildings on military reservations), the defense housing and non-farm public housing of the Farm Security administration, and the Division of Defense Housing Co-ordination.

The executive order established three principal constituent units within the NHA: the Federal Housing administration, the Federal Home Loan Bank administration, and the Federal Public Housing authority.

In addition to supervising and directing the activities of the three constituent units, the NHA administrator and his staff in 1942 performed a special function arising out of the war effort. In co-operation with the War Production board, the War Manpower commission, and other federal agencies, the office of the administrator determined the need for housing for war workers in areas where a shortage of housing existed or impended, which threatened to impede the war program, and devised ways and means of supplying such need.

The National Housing agency in 1942 established regional offices in Boston, New York city, Washington, Atlanta, Cleveland, Chicago, Kansas City, Dallas, Seattle and San Francisco.

(J. B. Bl.)

Federal Housing Administration.—The Federal Housing administration (one of the three major units of the National Housing agency) geared all its activities to the national war effort in 1942. Under its program, private investment funds totalling around $1,136,487,000 were mobilized to finance war housing projects, essential repairs and remodelling for war workers, and amortized financing of sound existing home properties. Its field offices processed private war housing priority requests on behalf of the War Production board. Its technical facilities were used to the utmost to further sound housing construction under war restrictions and shortages of critical war materials. Commissioner in 1942 was Abner H. Ferguson.

Congress amended title VI (War Housing insurance) of the National Housing act, under which the FHA operated in 1942, by increasing from $300,000,000 to $800,000,000 the aggregate amount of mortgages insurable under this title, extending the expiration date of the insurance authority from July 1, 1942 to July 1, 1943, raising the maximum amount of mortgages on one-to-four family houses eligible under section 603 and extending their maximum maturity from 20 to 25 years, and adding section 608, which made mortgages on large-scale war housing rental projects eligible for insurance.

Also, congress amended title I of the act to provide that loans not to exceed $5,000 might run for as long as seven years, if made for the purpose of financing the alteration or repair of existing structures to provide additional living accommodations for war workers.

Insurance of all types written during 1942 amounted to $1,136,487,237, compared with the high record of $1,185,852,709 written in 1941. This brought the total insurance written from June 1934 through Dec. 1942 to $6,398,604,623. These funds were advanced by private financial institutions. The FHA loaned no money. Income for 1942 was $27,298,702, of which $11,107,041 went to FHA operating expenses and $16,191,661 to the various insurance funds.

New dwelling units started in 1942 under FHA inspection totalled 159,575, compared with the previous high record of 220,300 started in 1940. Approximately 156,000 of the units started in 1942 were in the officially designated critical war housing areas.

Under section 203 of title II during 1942 the FHA insured 149,635 small-home mortgages for $691,445,427, compared with 198,799 for $876,707,384 in 1941. This amount brought the net total as of Dec. 31, 1942 to 982,457 mortgages insured for $4,274,505,550. These mortgages were protected by the Mutual Mortgage Insurance fund, which as of Dec. 31, 1942, had net resources of $50,398,753.

Under section 207 of title II, large-scale housing mortgages for $5,715,000 were insured in 1942, financing projects providing 1,539 dwelling units, compared with 27 for $12,997,841 in 1941. As of Dec. 31, 1942, mortgages insured numbered 355 and amounted to $145,665,516, with firm commitments to insure 3 more for $1,755,000. A total of 39,162 dwelling units were provided by the 358 projects. The Housing Insurance fund protecting these mortgages, as of Dec. 31, 1942, had net resources of $2,378,522.

Under section 603 of title VI, 68,706 war housing mortgages on one-to-four family dwellings for $267,015,578 were insured in 1942, compared with 3,778 for $13,431,250 insured from March 1941, when title VI became effective, through Dec. 31, 1941. As of Dec. 31, 1942, mortgages insured numbered 72,484 and amounted to $280,446,828.

Under section 608, which became effective May 26, 1942, mortgages on 31 large-scale war housing projects totalling $16,760,200 had been insured as of Dec. 31, 1942, with firm commitments outstanding to insure 15 more for $2,352,500. A total of 4,947 dwelling units was provided by the 46 projects.

The War Housing Insurance fund protecting mortgages insured under sections 603 and 608, as of Dec. 31, 1942, had net resources of $5,322,725.

Debentures issued in exchange for properties securing foreclosed mortgages insured under titles II and VI of the National Housing act, in addition to the protection of the funds, are guaranteed unconditionally as to principal and interest by the United States.

Under title I, a total of 432,755 property improvement loans for $155,551,032 was reported for insurance in 1942, compared with 687,837 for $282,716,234 reported in 1941, bringing the grand total to 4,129,816 loans for $1,681,226,529. (A. H. F.)

Federal Home Loan Bank Administration.—This agency directs the home financing and related activities of agencies formerly under the supervision of the Federal Home Loan Bank board. These are the Federal Home Loan Bank system, the Federal Savings and Loan Insurance corporation and the Home Owners' Loan corporation. In addition, the United States Housing corporation was transferred to the bank administration to complete its liquidation.

The presidential order of Feb. 24, 1942, consolidating the urban housing activities of the government under the newly established National Housing agency, designated John H. Fahey, former chairman of the Federal Home Loan Bank board, to direct the Federal Home Loan Bank administration with the title of commissioner. The offices of the other members of the board were vacated.

Federal Home Loan Bank System.—The Federal Home Loan Bank system was created by act of congress approved July 22, 1932, to provide reserve credit facilities for thrift and home-financing institutions—namely, savings and loan associations, and institutions of similar type, and savings banks and insurance companies. The system in 1942 functioned through 12 regional Federal Home Loan banks, established in Boston, New York city, Pittsburgh, Winston-Salem, Cincinnati, Indianapolis, Chicago, Des Moines, Little Rock, Topeka, Portland and Los Angeles.

Institutions approved for membership are required to invest in the capital stock of their respective regional banks. Of th aggregate stock of the banks, about 73% was held by the gov ernment in 1942. Beyond their capital stock, the regional bank obtained their funds from the sale of debentures and by accep ing deposits from member institutions.

The funds of each bank were used mainly in 1942 to mak advances to member institutions for the purpose of providin additional accommodations to local home loan borrowers and in vestors. Under certain conditions, advances for a short term might be obtained without the deposit of collateral. Long-term advances had to be secured by approved home mortgages o other acceptable collateral.

The bank system experienced steady and rapid growth. O Jan. 1, 1933, it had but 101 members, with estimated assets o $217,000,000. By June 30, 1942, membership had increased t 3,815, of which 2,308 were state-chartered home-financing inst tutions, 1,464 federal savings and loan associations, 26 insuranc companies and 17 savings banks; their combined assets were ap proximately $5,640,000,000. On the same date the paid-in cap ital stock of the regional banks amounted to $175,532,650 an their consolidated assets totalled $309,981,715. During 1941, in stitutions which were members of the bank system made abou 40% of the new mortgage loans on urban homes made by a institutional lenders throughout the United States.

Under the leadership of the regional Home Loan banks, th member institutions of the system in 1942 took an active part i the financing of homes for workers in the areas of war industrie where such dwellings could be safely financed by private capita

Federal Savings and Loan Insurance Corporation.—Th Federal Savings and Loan Insurance corporation, a permanen instrumentality of the U.S. government, was created by congres in 1934. It was established to insure the safety of investment up to $5,000 per investor, in each federal savings and loan asso ciation and in each state-chartered institution of the savings an loan type which applied and was approved for this protectio As of June 30, 1942, 2,374 associations with total assets of $3 461,000,000 had become insured, of which 1,464 were federal sav ings and loan associations and 910 were state-chartered institu tions. On June 30, 1942, the corporation had accumulated re serves amounting to nearly $33,000,000.

Home Owners' Loan Corporation.—The Home Owner Loan corporation was created by congress in 1933 to make loan directly to distressed urban home owners over a three-year peri by taking over their delinquent mortgages. After its lendin operations ceased in 1936, the corporation was engaged principall in the collection of the funds it loaned and in the sale and rent of the properties it was forced to acquire.

Loans were made at an interest rate of 5%, later accepte at 4½%, and were to run for a period not over 15 years and b retired through monthly payments covering principal and interes The act was amended to permit the corporation to extend i loans to a maximum of 25 years, where the borrower's circum stances and the condition of the security justified such extensio

Provided with $200,000,000 initial capital, HOLC was a thorized to issue U.S. guaranteed bonds in an amount not to e ceed $4,750,000,000, of which $3,489,453,550 were issued. total of $2,119,317,750 in bonds was outstanding as of June 3 1942. The corporation lent more than $3,093,000,000 to abo 1,018,000 home owners located in almost all the counties in th United States. Its average loan was slightly more than $3,00 As of June 30, 1942, only 5% of HOLC's 808,219 active accoun were in default. More than 160,000 loans amounting to $40 500,000 were paid off in full and the mortgages cancelled. Fro the beginning of its operations through June 30, 1942, HOLC a quired about 190,000 properties, of which it had sold abo

0,000. Of the unsold properties available for rental income, % were rented.

United States Housing Corporation.—The United States ousing corporation was created May 16, 1918, to provide hous- for war workers, during World War I. Congress made avail- le $100,000,000 to carry out this purpose and before it ceased ive operations the corporation had acquired approximately 000 houses and several hotels in 26 states and the District of lumbia. The corporation in 1942 held an interest in 445 houses d 54 vacant lots in 7 states, with an approximate value of ,000,000. Originally under supervision of the secretary of labor, corporation was transferred to the secretary of the treasury 1937, to the Federal Works agency in 1939 and then to the deral Home Loan Bank administration. The Federal Home an Bank administration was in 1942 liquidating the last of the ets of the United States Housing corporation. (J. H. Fa.)

ederal Public Housing Authority.—The Federal Public using Authority was established on Feb. 24, 1942 as one of constituent units of the National Housing agency. It was de responsible for all the public housing activities of the NHA, luding the public war housing program and the low-rent and m clearance program.

The authority in 1942 was providing public housing for in- grant war workers in localities with acute housing shortages ere private enterprise was unable to fill the need. Congress horized the expenditure of approximately $2,000,000,000 der various acts for such war housing. As far as possible, al housing authorities were used by the FPHA in the construc- n and management of war housing; where they were not avail- e, the FPHA built and operated directly. In the earlier phases the war housing program, permanent housing was built; but reasing shortages of material and labour and the need for speed l, by the end of 1942, limited the program almost exclusively temporary construction. Dormitories were being built for gle workers, both men and women; small apartments for ples; and group houses or apartments for families. Where jects were located in isolated communities, restaurants, recrea- n facilities and infirmaries were provided.

The public war housing program on Dec. 15, 1942, comprised 0 projects, including dormitory accommodations for 112,000 sons, 39,000 accommodations for couples, 377,000 dwellings larger families, and 24,000 trailers. It was estimated that se projects would house upwards of 1,500,000 persons. Ap- ximately 34% of this program was completed and the balance in planning and construction stages at the end of 1942.

The low-rent housing program of the federal government was horized by congress in 1937 and was administered by the ited States Housing Authority until Feb. 24, 1942, when its ctions were transferred to the Federal Public Housing Au- rity. As a result of World War II, the further construction housing for low-income families was suspended and, where sible, projects not yet occupied were being used during the ergency for the housing of essential war workers. The low- t and slum clearance program in 1942 was carried out en- ly by local housing authorities set up for this purpose by local governments pursuant to state legislation. These local au- rities could borrow from the FPHA up to 90% of the cost of -rent and slum clearance projects. For the purpose of making h loans, the FPHA was authorized to borrow $800,000,000. loans made to local authorities were repayable to the FPHA, ether with interest, over terms running up to 60 years. The HA was also authorized to make annual contributions to the l authorities in order to assist them in achieving rents within means of families in the lowest income group. In order to ure slum clearance, the law provided that for every new dwelling built, at least one slum dwelling should be eliminated either on the site of the project or elsewhere within the locality.

The low-rent housing program in 1942 (exclusive of projects converted to use for war workers) included 465 projects with 117,000 dwellings, substantially all of which had been completed. The average monthly rent charged for these dwellings, including heat and utilities, was $17.71 per month in April 1942, and the estimated average family income of the tenants was $815 per year at time of admission to the projects. (*See* also Housing.) (H. Eh.)

National Income and National Product.

Under the necessity of mobilizing the nation's economic resources for an all-out war effort, the national income of the United States in 1942 again rose to a new high record. Despite the high level of income that was achieved in 1941, there was no slackening in the pace of the expansion in 1942. From the total of $77,200,000,000 in 1940, the national income rose to $94,800,000,000 in 1941 and to the preliminary estimate of $117,400,000,000 in 1942. Thus, the figure of $100,000,000,000 of national income, which only a few years ago was considered an almost unobtainable ideal, was exceeded under the pressure of war. Against the 1942 national income total, the $69,800,000,000 peak of World War I or the $83,365,000,000 total for 1929 lost their significance as symbols of the nation's productive power.

Because of its great usefulness in following the economic changes wrought by the war, the department of commerce during 1942 placed increasing emphasis upon measurement of the gross national product. The preliminary estimate of this aggregate for 1942 was $152,000,000,000. This compares with the 1941 total of $119,500,000,000 and the figure of $97,100,000,000 for 1940.

Meaning of National Income and Gross National Product.—Proper use and interpretation of national income and product statistics require an understanding of the concepts upon which their compilation is based. The national income represents a summation of the net earnings of the various factors of production derived from their association in current economic production. Both money income and income in kind are included, so long as they are derived from participation in current production. Such income receipts as relief, unemployment benefits, pensions, gifts, capital gains or losses, and gains from illegal activities are excluded since they do not represent earnings derived from current productive activity. The incomes included in the compilation are net incomes; that is, in the case of business enterprises, the incomes are counted after deduction of costs of doing business and after allowance for depreciation and business taxes. In the case of corporations the income is taken after allowance for income and excess profits taxes. The estimates are limited to those incomes which are ordinarily derived from the market economy. Thus, the value of the services of housewives are not included whereas the income derived from government employment or government obligations are included. It is well to emphasize that the national income is not simply the sum of money incomes of all persons in the nation, such as might be reported for income tax purposes. In the first place, it includes the income of corporations, apart from capital gains and losses, that is not distributed to individuals. In the second place, it includes only such receipts of individuals as are derived from currently rendered services, with receipts of both money and commodities being taken into account.

The gross national product, as measured by the department of commerce, represents a summation of three major components: (1) the market value of goods and services flowing to consumers,

(2) the value of the gross output of capital goods retained by private business, and (3) the cost value of the goods and services produced or purchased by government. The gross national product differs from the national income in that no allowance is made for depreciation and other reserves (which constitute business expenses in the computation of income) or for taxes paid by business (which while they must be covered in the sales value of business output are not considered to be the earnings of any of the factors of production). One may best conceive of the meaning and utility of these two aggregates by considering the gross national product as the market value of the finished goods and services of private enterprise (inclusive of capital goods) plus the cost of government output, and considering the national income as the net earnings of the factors of production derived from that product.

Changes in National Income Since 1919.—Estimates of national income from 1919 to 1942 are shown in Table I. It will be noted that the economic boom associated with World War I reached its high point in 1920. There followed a sharp and short liquidation in 1921 and then an almost continuous upsurge of economic activity during the prosperous '20s, with a new high for national income in 1929 that was not to be surpassed until 1941. The magnitude of the disastrous depression of the early '30s may be seen in the fact that the national income was more than halved between 1929 and 1932. From this low level, substantial progress was made in raising the national income to a total of almost $71,000,000,000 in 1939, a mark well below the average for 1926–29 in dollar terms. The period of economic recovery from the bottom of the depression to the last year of peace in Europe was marked by recession in 1938.

This brief account of the movement of national income in the United States between the two great wars is in current dollar terms. The estimates, consequently, are affected by the general level of prices as well as by the physical quantity of goods and services produced. Since for many purposes the physical quantity of national production, or real national income, is required, a series depicting this volume is also shown in Table I, average prices of 1935–39 being used as a base. Entirely adequate price information for adjusting the national income in current dollar terms is not available, but the estimates in Table I are sufficiently accurate for most purposes. There are two interesting points to be observed in connection with these estimates of real national income.

Table I.—*National Income in Current and Average 1935–39 Dollars*

Year	Current dollars	1935–39 dollars*	
	Total (In 000,000,000s of dollars)	Total (In 000,000,000s of dollars)	Per capita ($)
1919	67.6	47.8	455
1920	69.7	44.1	414
1921	52.6	40.8	377
1922	60.4	49.5	451
1923	70.0	56.7	508
1924	70.0	56.4	499
1925	74.6	59.5	518
1926	76.8	60.7	521
1927	76.2	61.9	524
1928	80.1	64.8	541
1929	83.3	68.1	566
1930	68.9	58.0	471
1931	54.5	51.0	411
1932	40.0	41.6	334
1933	42.3	45.7	364
1934	49.5	50.6	400

*Adjusted for price changes by use of a combination of cost of living indexes of urban workers and farmers and price index of capital goods.

†Preliminary.

The first is that the year-to-year changes in the total are co siderably less violent than in the estimates of national income current dollars. The depression of 1921, for example, was large accounted for by a drop in prices rather than by a decline physical output. The depression of the early '30s was also part a result of price movements, although in this instance the decli in real income was very substantial. On the other hand, the rece sion of 1938 was to a lesser degree accounted for by a decline prices. It may be noted, however, that the volume of net outp after adjustment for price changes was higher in 1939 than 1937, whereas the reverse was true of national income in curre dollars.

The second is that the comparison between the general level national income in the '30s as against the '20s is more favourab to the latter decade if real output is used than if the money val is used. In other words, the lower level of the national incom in the '30s is partly accounted for by the lower prices prevaili in that period. It is most striking, for example, that the re national income in both 1937 and 1939 exceeded that of 192 Furthermore, the real national income in 1939 was 50% abo 1919, whereas the current dollar value showed less than a 5 increase. This large rise in real income is a reflection of the i crease in the capital and labour resources being utilized in t productive process and also of the tremendous advances in pr ductive efficiency occasioned by technological development. far as the importance of the latter factor is concerned, it is si nificant that the larger quantity in 1939 over 1919 was achiev with a smaller percentage utilization of the available producti capacity of both men and machines.

In assessing the importance of the rise in national income ov time, it is also essential to take account of the increase in pop lation. As population rises, there are, of course, more persons share in the goods being produced for present and future co sumption and also more hands available for contributing to tot output. The changes in income produced per capita after adju ment for fluctuating prices are shown in Table I. Real income p capita in 1937 and 1939 was about equal to the per capita re income in 1927 and 1928. It did not exceed the level reached 1929 although the difference between 1929 and 1939 was re tively small. In comparing the change from 1919 to 1939, it m be noted that about half of the 60% rise in aggregate real inco represented a gain in per capita income.

Rise in National Income after 1939.—The outbreak of Wor War II marks 1939 as the end of a definite phase in the econom life of the nation. For, as the dramatic and swift invasion of t Low Countries and the conquest of France revealed the unp paredness of the United States in the face of possible aggressi a huge rearmament program was undertaken. This was to hav powerful influence on the level of economic activity and, con quently, upon the size of the national income. The stimulus p vided by the defense effort was already evident in 1940 when t national income rose more than $6,000,000,000, even though t program was not inaugurated until the middle of that year. was not until 1941, however, that the full impact of the rearm ment program became apparent. For in that year, as previou noted, the national income rose by $17,000,000,000.

With the actual outbreak of war at the end of 1941 the effo to obtain the maximum output of armaments in the U were intensified, leading to an ever greater use of available e nomic resources. As a consequence, the national income cont ued to expand in 1942, with a gain for the year of almost $2 000,000,000. The data in Table I show that rising prices w not without their influence on the national income in 1941 1942, though the larger part of the rise represented an increase real output.

espite the tremendous income total achieved in 1942 it was lent at the end of the year that the nation's economy had not reached its maximum productive power under wartime condi- s. The secretary of commerce stated that he expected the onal income in 1943 to reach $135,000,000,000, apart from influence of a rise in prices in the course of that year.

istributive Shares of the National Income.—An analysis of national income in terms of the shares distributed or accru- to the various factors of production is presented in Table II. previously mentioned, the shares representing business earn- are all net of any expenses or taxes incurred in the operation usiness.

1942 total salaries and wages rose to over $80,000,000,000, pared with a total of under $50,000,000,000 in the relatively perous year of 1940. Although the salary and wage total was ted by rising wage rates over this two-year period, the rd-breaking expansion represents mostly the fact that new ions of persons were put to work and that the employed popu- n as a whole was working considerably longer hours than the case two years earlier. Another factor of importance in ing up the salary and wage total was the fact that the poorer industries tended to shrink relative to the higher paid heavy ls industries, the latter having expanded so tremendously to t the requirements of total war.

he largest percentage gain among the distributive shares since occurred in the net income of agricultural entrepreneurs. arily because of a substantial rise in prices, this component he national income more than doubled over the two-year od. Nonetheless, agricultural production was expanded most ificantly as the farmers of America made their contribution rd the winning of the war with a record-breaking output of and other farm products. In 1942 alone, it is estimated that cultural production was increased by about 12%.

et income of corporations usually shows the largest percent- change during periods of rising or falling national income. much as this component of the national income is included he total after allowance for income taxes, however, the substantial increase in tax liabilities of the past two years has severely limited the rise. As a matter of fact, from the data available at the close of 1942 it would appear that corporate net income for 1942 was slightly under the 1941 total.

Industrial Origin of National Income.—An analysis of the industrial origin of the national income is presented in Table III. The figures for each industry represent the net earnings of the factors of production employed in that industry.

Considering that the impetus to the expansion of the national income after 1939 came from outlays for armaments and armament-producing facilities, it is not surprising that the income originating in the manufacturing and contract construction industries increased more substantially than in most other areas of the economy. As against an increase in total national income from 1939 to 1942 of little over 65%, the net value of manufacturing output and of contract construction rose more than 100%. In this regard, the armaments boom was similar to the durable goods investment booms of earlier periods. Agriculture was the only other industry to match this rate of gain. It is also evident from Table III that the war continued the upward trend of the net output of government that had been one of the major characteristics of the economy after 1930. This continuance was primarily due to the expansion of the armed forces of the nation.

Utilization of Gross National Product.—As previously mentioned, the gross national product consists of the value of currently produced goods and services utilized by government, of gross additions to private capital, and of goods and services purchased by consumers. It is, therefore, the appropriate aggregate for showing the apportionment of current output between war and nonwar uses. The national income, on the other hand, is not readily adapted to this purpose, since it measures only the earnings of the factors of production whereas government expenditures for war are expressed in terms of the market prices paid.

The major components of the gross national product from 1939 to 1942 are shown in Table IV. Perhaps the most striking thing in the table is the spectacular increase in the total gross national product in both 1941 and 1942. Over that two-year period the value of total output rose by more than 50%, most of which is accounted for by an increase in the physical flow of goods and services. This unprecedented rate of expansion continued undiminished throughout the year 1942 so that by the final quarter of that year the gross national product had attained an annual rate in excess of $165,000,000,000.

The driving force behind the expansion was, of course, federal government expenditures for goods and services required in the rearmament and war efforts. (The figures shown in the table for war expenditures are not the same as total government outlays for war purposes since some of these outlays may not be for currently produced goods and services.) While there was a significant increase in war output during 1940, owing to the inauguration of the defense program in the middle of that year, the real results of the defense program became fully evident in 1941 when war expenditures exceeded $11,000,000,000. Pearl Harbor brought an intensification of the war effort and the setting of new and previously unheard of goals for war production, which in 1942 carried war expenditures to the spectacular total of approximately $50,000,000,000, a figure constituting about one-third of the gross national product. During the fourth quarter of the year war expenditures were at an annual rate exceeding $70,000,000,000. These figures tell their own story about the nation's success in economic mobilization for war.

It may be observed that both in 1940 and 1941 the expansion of war production did not require any curtailment of goods and services available for private use. As a matter of fact, in both those years nonwar production was steadily increased. This was the case with both capital formation and consumers' goods and services, and was made possible because at the beginning of the rearmament program the nation had available a huge pool of unemployed economic resources, both men and machines. In 1942, however, this situation came to an end, the value of war output increasing more than the total gross national product. What this means is that the huge total of war goods made available in that year was achieved in part by reducing various types of nonwar output. Both federal nonwar and state and local government utilization of current production were decreased. The major cut, however, came in the field of private capital formation where the record-breaking 1941 total of over $19,000,000,000 was reduced to a little over $8,000,000,000. Both private construction and private purchases of machinery and equipment were drastically curtailed while, in addition, a halt was called to the substantial increase in inventories which was recorded in 1941.

In terms of actual dollars spent, consumers' purchases of goods and services actually increased in 1942. This rise, however, merely reflected the influence of rising prices; in terms of dollars of constant purchasing power, the goods and services received by consumers was slightly less in 1942 than in 1941. That it proved to be possible to maintain consumers' goods and services at so high a level in the face of the tremendous requirements of the war program was due to two important factors. In the first place, the total of consumers' purchases was larger than current production by virtue of the drawing down of business inventories of consumers' goods. In the second place, the fact that the United States did not reach an overall manpower shortage in 1942 meant that the restrictions of consumers' goods were due entirely to shortages of raw materials and imported commodities. Because the war program consisted mostly of munitions and munitions' manufacturing facilities, the material shortages were largely confined to durable goods. It may be seen that consumers' durable goods declined fairly sharply and this decline would have been very much greater had it not been for previously accumulated inventories. While there were isolated shortages among the nondurable goods, on the other hand, many of these commodities as well as virtually all consumers' services were able to be increased. The decline in consumers' durable goods, therefore, was almost entirely offset by increases in nondurable goods and services. This does not mean that the consumer situation would be equally favourable in 1943, for, in the course of that year, a manpower shortage was expected to develop and this might require curtailment in the output of nondurable goods and services. Furthermore, the food and clothing requirements of both the U.S. armed forces and the allies were certain to be larger, thereby leaving a smaller total for the U.S. civilian population.

Consumer Income and Saving.—In Table V is shown a bre down of the national income by use of funds. These data are p ticularly interesting in time of war since they demonstrate basic character of the inflationary problem. Because of the en mous requirements of the war, the total use of economic resour increased substantially, leading to the expansion of the natio income that has been previously pointed out. Most of this inco flows to individuals although part of it is syphoned off in the fo of taxes either before or after it reaches the individual. As m be seen, both employment and personal taxes increased fa substantially from 1941 to 1942. Nonetheless, there occurre much greater increase in the disposable income of individua that is, their income after payment of taxes. In 1942 this posable income was almost $108,000,000,000, as contrasted w less than $74,000,000,000 two years earlier. Inasmuch as it not possible under wartime conditions to produce all the go and services that consumers might want to buy with this larged income, there was an inevitable pressure upon the pri of these goods.

Table V.—*U.S. National Income by Use of Funds*
(In 000,000,000s of dollars)

Item	1939	1940	1941	194*
National income	70·8	77·3	94·8	117
Add: Transfer payments	2·4	2·6	2·5	2
Less: Corporate savings	·4	1·2	2·6	2

State and local	1·7	1·7	1·7	1
Equals: Disposable income of individuals	67·9	73·6	88·3	107
Less: Consumers' expenditures	62·0	66·2	75·8	81
Equals: Net savings of individuals	5·9	7·4	12·5	26

Source: U. S. Department of Commerce. *Preliminary.

As may be seen in Table V, savings of individuals rose en mously after 1940 and particularly so in 1942. This increase savings was, of course, a powerful anti-inflationary factor. S ings increased for a number of reasons: they always do when come increases; the government placed restrictions on the use consumer credit installment sales, charge accounts, etc.; ma goods that consumers would have bought were not available; the government stimulated savings through the sale of war bo and stamps. In addition, however, savings rose simply beca the dollar volume of consumer spending was limited thro price controls and rationing. This means that a substantial p of the increased savings does not constitute an infallible brake inflation for, if the price control and rationing machinery were weaken, savings would stop increasing or decline and consum as a whole would spend a larger volume of money on a gi supply of goods and services. With consumers' income still rap ly rising and with shortages of consumers' goods becoming m and more widespread, the inflationary problem was certain to b serious one. National Labor Relations Board.

The activities the National La Relations board, shaped as they were to meet the exigencies the U.S. defense preparation period, found in the first full year of 1942 direct application to the problems of labour re tionship under the high pressure of war production.

Methods were further advanced for giving priority of hand to cases involving war plants. Liaison was perfected with ot federal agencies in the interest of effecting a speedy resolut of questions concerning representation, or to advance action charges of unfair practice lodged against war producers. Wh

r consonant with the rights of employees under the National
or Relations act, the board welcomed the co-operation of
er agencies in adjusting cases by informal methods.

uring 1942 there were four times as many workers organized
unions as during the first year of World War I. The activi-
of unions during the year to settle grievances and to win
e adjustments were at least four times as extensive. This
to be represented in collective bargaining negotiations over
time wages and conditions, still further accentuated by
our's agreement to abandon the strike as a means to assert its
ms, resulted in a sharp rise in the number of representation
s brought to the board. Thus, of the 9,358 total cases re-
ed in 1942, 5,352 were representation petitions, the highest
o of such cases to unfair labour practice cases in the history
he board.

he orderly determination of majority representation under
ernment supervision took place in 3,886 board elections in
ch 1,020,504 valid votes were cast. They were held in muni-
plants, at pitheads, in shipyards, in logging camps and on
s ready to sail. The majority of the elections were conducted
the consent of both the employer and the employees, and
roximately three-quarters of the ballotings were held not as
ntest between competing unions but as the attempt of a single
n to establish its right to a majority representation.

he largest single election held in a war industry during 1942
that in the plants of the Carnegie-Illinois Steel company,
re 50,205 valid votes were cast. Other large elections were
e conducted at Wright Aeronautical corporation, in which
55 votes were counted, Tennessee Coal, Iron and Railroad
pany, with 10,744, and Sperry Gyroscope, in which 9,427
d votes were cast.

f 3,803 secret ballot elections conducted, 1,702 were won by
ates of the Congress of Industrial Organizations, 1,225 by
erican Federation of Labor unions and 345 by unaffiliated
ur organizations. In 531 elections a majority of votes was
received by any of the organizations appearing on the ballot.

s was the case in previous years, the board carried out its
of preventing and remedying unfair labour practices by in-
nal methods in its field offices and without the necessity of
ing public hearings in a great majority of these cases. In the
ndar year 1942, the board disposed informally of 90% of
e cases, 4,554 as a result of obtaining agreements between
parties, dismissing cases of no merit, and successfully re-
ting the withdrawal of unfounded charges against employers.
nly 8% of all the unfair labour practice cases handled was
cessary for the board to issue decisions and orders.

istinction must be drawn between the basic functions of the
ional Labor Relations board and of the War Labor board
.). The former was entrusted by congress with the duty of
enting and remedying unfair labour practices and determin-
representatives for collective bargaining. The War Labor
d was established on Jan. 12, 1942, to settle wartime dis-
s involving wages, union security, grievances and other sub-
tive provisions of labour agreements. The NLRB co-operated
ely with the WLB in 1942 by exchange of information and a
integration of their efforts. Typically, determination by the
RB of bargaining representation in many cases was a first
ssary step to the settlement by WLB of disputes of wages
conditions of employment.

he view of full enforcement of the National Labor Relations
as necessary in wartime to provide a basis for good morale
sound labour relations in war plants, particularly in view of a
petitive and divided labour movement and labour's pledge
to resort to strikes, was firmly held by the board in 1942,
was accepted in general by the courts.

The board's litigation record for the calendar year 1942 was as follows: The supreme court enforced 9 board orders in full or with modification; in 18 instances the supreme court denied petitions by employers for review of circuit courts of appeals decisions favourable to the board as against 1 petition by the board for review of a lower court decision unfavourable to it; the circuit courts of appeals enforced in full or modified 79 board orders and denied enforcement to 2. Cumulatively for the first seven calendar years, 1936–42, the board's record in the court was as follows: Board orders enforced in full or with modification by the supreme court, 41; board orders denied enforcement by the supreme court, 2; supreme court cases involving other questions: 6 decided favourably to the board, 1 decided unfavourably; petitions by employers for review of circuit courts of appeals decisions favourable to the board: 69 denied by the supreme court; petitions by the board for review of circuit courts of appeals decisions unfavourable to the board: 4 denied by the supreme court. During the seven years, the circuit courts of appeals enforced in full or with modification 321 board orders and denied enforcement of 58 board orders. (*See* also LABOUR UNIONS; LAW; STRIKES AND LOCK-OUTS.)

(H. A. Ms.)

National Lawyers Guild.

The guild program was entirely devoted to assisting the successful prosecution of the war in 1942. These activities included voluntary, free legal assistance to members of the U.S. armed forces and their dependents and to war agencies of the government. The national executive board presented a plan to the Office of Price Administration for utilizing the voluntary services of U.S. attorneys in the enforcement of price and rent ceilings and as legal advisers to rationing boards. The OPA accepted this plan. The Committee on Civil Rights drafted memoranda for congress in support of constitutionality of legislation to outlaw payment of poll taxes as a prerequisite for voting in federal elections. The executive board submitted to congress an analysis of the activities of the Dies committee together with a statement opposing continuation of this committee. The Committee on Taxation prepared an analysis for congress in opposition to the Ruml plan to forgive one year's payment of federal income tax. The national president of the guild, Robert W. Kenny was elected attorney-general of California. (M. PR.)

National Monuments: *see* NATIONAL PARKS AND MONUMENTS.

National Parks and Monuments.

In 1942 many peacetime activities of the National Park service such as travel promotion, road construction and development of facilities for visitors were halted so that all possible aid might be given to the prosecution of the war. But the basic activity of the National Park service—that of preserving inviolate, so far as possible, America's great scenic and historic heritage as exemplified in the national parks, monuments, and historic areas—was carried on as vigorously as in previous years.

Two national monuments—Cabrillo in California and Fort Pulaski in Georgia—were placed under military jurisdiction for the duration of the war. Sections of other National Park service areas were being use for military camps, manoeuvre grounds, bombing ranges and training centres. In fact, every area in the National Park system was making some contribution to the war program.

Protection of forests in national park areas is a major responsibility of the service in wartime. The vast mountain and plateau regions in the National Park system are the sources of rivers which supply many industrial areas with water for domestic use, navigation, irrigation, power and recreation. Liquidation of the Civilian Conservation corps and the release of employees to the armed forces and war agencies reduced available manpower and necessitated the training of every available service employee in protection activities and essential elements of combating forest fires.

One area—the Andrew Johnson National Monument, Greeneville, Tennessee—was added to the National Park system. This monument, established by Act of Congress of April 27, 1942, includes the Andrew Johnson tailor shop, his residence, and the cemetery in which he is buried.

Because of the war and the need to conserve gasoline, tires and public transportation facilities, the number of visitors to the National Park system during the travel year ended Sept. 30, 1942, was reduced to 10,620,265, a 50% decrease compared with the all-time high travel experienced in 1941. Of this total 887,000 were members of the armed forces. (N. B. D.)

National War Labor Board: *see* WAR LABOR BOARD, NATIONAL.

National Youth Administration.

The National Youth administration provided training to youth between the ages of 16 and 24 who were out of school, to qualify them for jobs in war industries in which there was a present or potential shortage of labour.

Students in secondary schools and colleges were given part-time employment for small wages to enable them to continue their education.

The National Youth administration operated war production training projects through which out-of-school youth were employed in workshops to learn mechanical unit skills under conditions similar to those which are found in industry. NYA shops were operated on a multiple-shift basis, and provided training in metal and machine shop work, forge and foundry work, aviation mechanics, radio and electrical work, welding and similar occupations vital to the war effort.

The War Manpower commission, under whose jurisdiction the NYA operated in 1942, determined the types of training to be provided; the U.S. Employment service registered all NYA youth as an aid to their placement in industry. During the fiscal year ending June 30, 1942, more than 342,000 NYA-trained youth obtained jobs in industries directly or indirectly concerned with war production.

The NYA program for needy students attending non-profit making, tax-exempt schools, colleges and universities provided monthly wages ranging from $3 to $6 in secondary schools, and $10 to $25 in colleges and universities, in return for useful work performed under the direction of the school officials. Employment was given on the basis of scholastic merit and proved need. Both programs were administered by the NYA through 11 regional offices co-ordinated through the national office in Washington, D.C. The National Youth administration was established by executive order of the president on June 25, 1935. Originally set up within the Works Progress administration, the NYA was transferred to the Federal Security agency in 1939, and came under the jurisdiction of the War Manpower commission Sept. 17, 1942. After its inception through June 30, 1942 the NYA provided jobs for almost 2,500,000 youths on the out-of-school program and more than 2,000,000 youths on the student work program.

The National Youth administrator in 1942 was Aubrey Williams. (A. Ws.)

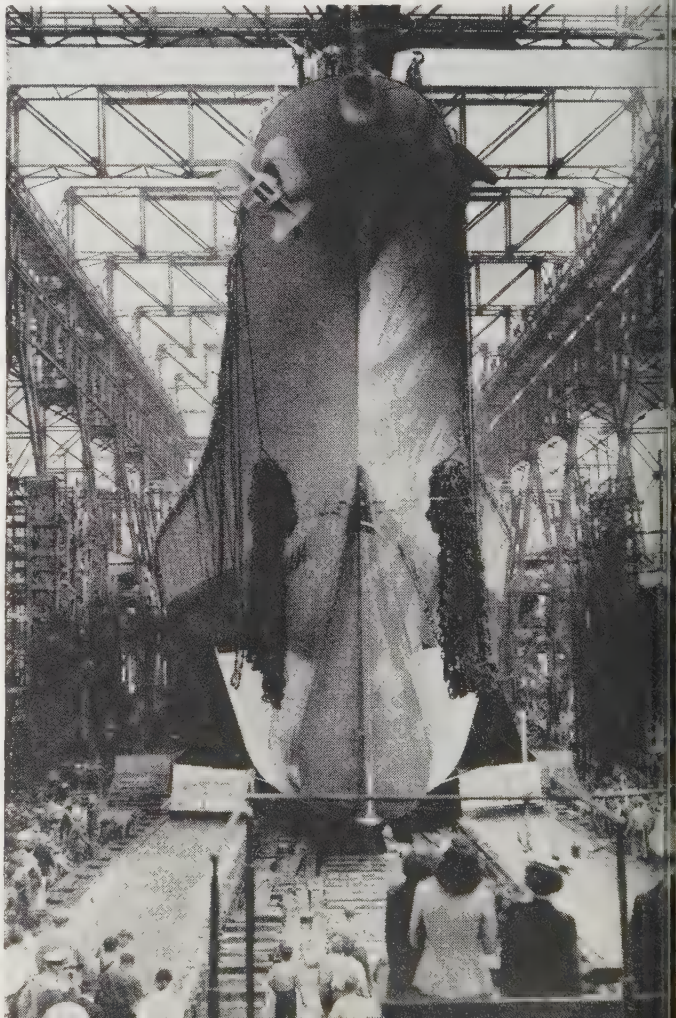
Navies of the World.

An inevitable result of the wid spread war at sea was to give impetus to the development of new tactics, new types of shi new weapons and new methods of using them.

So severe were German submarine losses in the early part the war through the efficiency of the British "asdic" method detection, that fresh tactics were subsequently followed by t U-boats. Instead of attacking in submerged condition duri daylight, most of their depredations were subsequently carri out on the surface at night, when their low silhouette was n easily spotted. To meet this fresh menace, the star-shell, or inally devised to light up destroyers attacking a fleet under cov of darkness, was used extensively to reveal submarines trying torpedo merchant vessels sailing in convoy.

New types of warships included the corvette, the earlier desi of which incorporated some of the features of the fast patr vessels known in World War I as "P-boats," together wi the hull form of the whale-catcher. Corvettes were turned out hundreds for the royal navy and royal Canadian navy, provi themselves invaluable for the work of escorting convoys acro the Atlantic. In 1942 it was reported that 50 such vessels of improved type were being built for the U.S. navy. Another ty which was developed considerably in scope and design was t motor torpedo boat and its offspring, the motor gunboat. The were referred to by the British admiralty by the comprehensi term "light coastal craft." During 1942 craft of this type op erated with increasing success against German coastal traffic

LAUNCHING OF THE U.S. BATTLESHIP "Iowa" Aug. 27, 1942. It was heaviest ship, and the largest battleship, ever built to that date



JAPANESE AIRCRAFT CARRIER "Ryukaku" aflame and about to sink after an attack by U.S. dive bombers and torpedo planes May 8, 1942, during the battle of the Coral sea

English channel and North sea. Germany's own craft of this were known as *schnell-boote,* or high-speed boats. Unfortely the British official practice of referring to them as oats" tended to puzzle the public, who imagined them to be h more formidable than they had proved to be. Italian vessels is category, officially classed as M.A.S. (*motoscafi anti-somgibili*) accomplished singularly little in war, losing heavily on lry occasions without accomplishing anything of note. Another an device, a torpedo in a light framework attached to a tiny with an outboard motor which could be steered towards its et by one man, also proved ineffective. Japan's contribution the midget submarine, manned by two or three men. This may be written off as a failure, five having been lost at Pearl oor and quite as many in an abortive attack on Sydney har. Yet another type which underwent development was the ircraft ship. The highly successful British cruisers of the lo" class were primarily designed for antiaircraft duties, and mber of obsolescent destroyers underwent rearmament for same purpose. Frequent mention was made of German "flak" s, trawlers and other small vessels of mercantile type armed high-angle guns.

ew weapons included the magnetic and acoustic mine, both of h were laid extensively by aircraft. Originally an enemy on, the air-borne mine laid by the R.A.F. became a serious ce of trouble to the Germans in the Baltic in 1942.

rpedo attack from the air underwent the greatest developt, though it was in the experimental stage before 1918. Outding allied successes gained by this means included the disg of the Italian fleet at Taranto in Nov. 1940, the crippling e German battleship "Bismarck" in the Atlantic in 1941. and sinking of Japanese aircraft carriers and other ships in the fic in 1942. On the enemy side can be cited the destruction ght at Pearl Harbor, the sinking of H.M.S. "Prince of Wales" "Repulse" in the China sea, and sundry U.S. warships sunk e Pacific.

the tactics of night fighting, the technique developed by iral Sir Andrew Cunningham's fleet at the battle of Matapan imitated by the Japanese in the Solomons in Aug. 1942, when .A.S. "Canberra" and three U.S. cruisers were sunk. In the wing November the tables were turned by Admiral Halsey, inflicted a heavy defeat on the Japanese in a series of night ons.

During 1942 two British battleships of 35,000 tons passed into service, bringing the total of capital ships in the royal navy up to 15, the same number as at the start of the war. It may be assumed that three new American battleships of 35,000 tons were also completed by the end of that year.

Aircraft carriers continued to prove their value, particularly in connection with torpedo attack from the air. In the Pacific they were in the forefront of the battle until casualties compelled both sides to husband their resources in this category. Fortunately the United States was in a far better position to replace losses than was Japan. Many more auxiliary aircraft carriers, classed in the U.S. navy as "aircraft escort vessels," were launched and commissioned in 1942. Converted from mercantile hulls, they proved extremely useful in the protection of convoys from air attack, though their speed was not sufficient to enable them to operate with a fleet. Neither Germany nor Italy had any aircraft carriers in service.

Both allied and enemy navies incurred numerous cruiser casualties, but the latter lagged far behind in replacement of such losses. Good progress would appear to have been made with the large U.S. program of cruiser construction. Certain units not too far advanced were ordered to be completed as aircraft carriers, one of them being the U.S.S. "Independence," ex-"Providence," of 10,000 tons. There was reason to suppose that the large ships of the "Alaska" class, designed as battle cruisers, would instead be built as additional aircraft carriers.

How far the Japanese navy had gone towards replacing its numerous losses was not revealed. Construction in that country had latterly been slow, but it is possible that a couple of new battleships were completed in 1942. Destroyers and submarines were being turned out at the rate of at least 20 of each per annum.

Russian naval operations in 1942 continued to be on a small scale in both the Baltic and Black seas, being mainly confined to submarine attacks on German transports and merchant vessels, though some small warships were also claimed to have been sunk.

A soviet estimate of the number of German submarines in service put the total in 1942 at over 300, though probably not more than from one-quarter to one-third of these would be operating at sea at the same time. Italian submarine strength almost certainly declined during 1942. Japan managed to send a submarine or two

THE U.S. AIRCRAFT CARRIER "LEXINGTON" shortly before it sank May 8, 1942, during the battle of the Coral sea

into the Atlantic as a token of solidarity with its allies.

British submarine construction was still a secret, but from the activity displayed in the Mediterranean and elsewhere during 1942 it was plain that the number in service remained considerable. Submarines of the U.S. navy accomplished valuable work in destroying Japanese mercantile tonnage in the Pacific, and undoubtedly increased considerably in number in the year.

British Naval Strength.—Before summing up the strength of the royal navy in ships at the end of 1942, a survey should be made of losses incurred since war began in Sept. 1939. These amounted to 5 capital ships; 5 aircraft carriers; 25 cruisers, including 4 rearmed for antiaircraft duties; 1 fast minelayer; 88 destroyers; 42 submarines; 11 sloops; 7 fleet minesweepers; 1 monitor; 9 river gunboats; 15 corvettes and patrol vessels; 14 armed merchant cruisers; 8 auxiliary minesweepers; 14 armed yachts; 148 trawlers and whalers; 16 drifters; 1 coastal minelayer; 14 light coastal craft; 2 fleet tugs; and 21 miscellaneous auxiliaries.

After allowing for these losses, and for such new ships as were believed to have been due for completion by the end of 1942, the strength of the royal navy at that date might be reckoned at 15 battleships (including one battle cruiser); 8 first-line aircraft carriers; 60 cruisers; 4 minelayers; 280 destroyers; 50 submarines; 44 sloops; 150 minesweepers; 300 corvettes; 3 aircraft tenders; 2 netlayers; 2 monitors; 9 river gunboats; 6 coastal minelayers; and a very large number of light coastal craft, comprising motor gunboats, motor torpedo boats and motor launches. Trawlers, drifters, armed yachts and mercantile auxiliaries of every description were too numerous for an estimate to be possible.

Of ships on order at the outbreak of war there were still in hand 4 battleships and possibly 2 aircraft carriers, though the latter were scheduled for completion by the end of 1942. Naturally a great many more ships of various categories must have been put in hand since 1939.

Naval forces of the dominions, including the royal Indian, royal Australian, royal Canadian and royal New Zealand navies, as well as the Newfoundland, South African, Burmese, Ceylon and Kenya naval forces, are included in the above figures. Their personnel is known to have been increased greatly since war began, amounting in 1942 to 25,000 for the R.A.N. and to 28,000 for the R.C.N. The latter expected to reach a total of 44,000 by March 1943, so rapidly was the force expanding. Canada was building small warships, such as corvettes, minesweepers and patrol vessels, in very large numbers, not only for its own service but also in some measure for the royal navy and United States navy. Austra besides providing for its own needs in the way of destroyers a minesweepers, was constructing sloops for the royal Indian na

United States Naval Strength.—The largest program of na construction in the history of the United States, designed to p duce a "two-ocean" navy, was in full swing. Ships in service the end of 1942 were estimated to be, at least: 16 battleshi 3 aircraft carriers; 36 cruisers; 224 destroyers; 126 submarin 14 gunboats; about 50 patrol vessels (ex-yachts); about 350 su marine chasers; more than 14 aircraft escort vessels; 22 seapla tenders; 14 minelayers; about 150 motor torpedo boats; a more than 400 minesweepers, besides numerous fleet auxiliaries all kinds.

Under construction or on order were 14 battleships (though construction of 5 of these had been suspended temporarily) battle cruisers (which may be completed as aircraft carriers); aircraft carriers, not including 500,000 tons authorized withd number of ships being stated; 42 cruisers, not including 500,c tons more authorized; 100 destroyers, not including 900,000 to of "destroyers and escort vessels" authorized; 180 submarin and large but indefinite numbers of other warships of every ca gory. Authorized personnel of the navy was 500,000, and of marine corps 104,000.

Japan.—Allowing for the intense secrecy which had been p served concerning Japanese naval construction, it was proba that at the end of 1942 there were in service 10 or 11 batt ships; 4 aircraft carriers; 15 to 20 cruisers; 90 to 100 destroye between 80 and 90 submarines, excluding the midget type; ab 15 seaplane carriers; 5 coast defense ships; and an uncert number of ancillary vessels, such as minelayers, minesweepe submarine chasers and gunboats. Under construction were 2 3 battleships; 1 or 2 armoured ships of a design believed to semble the German "pocket battleships"; and an unknown nu ber of aircraft carriers, cruisers, destroyers, submarines, seapla carriers, etc.

France.—Of the French fleet only a few small craft remai under the orders of the Vichy government, as nearly every ves of importance was scuttled at Toulon on Nov. 27, 1942, to av seizure by the Germans. In ports outside its authority there w 2 modern battleships (both disabled) and 2 old ones, with cruisers and a number of destroyers and submarines, all of wh would presumably be thrown into the struggle against the a A solitary aircraft carrier was immobilized in the West Indi together with a couple of cruisers. Laid up at Alexandria were battleship, 4 cruisers, 3 destroyers and a submarine; while wh last heard of a fifth cruiser was lying at Saigon, in Indo-Chi under Japanese control. Several destroyers, seagoing torpe boats and submarines appeared to have been damaged and p sibly reduced to wrecks in resisting the allied occupation French North Africa. A cruiser, a few destroyers and submari and 4 patrol vessels were all the new ships in hand in Fren shipyards at the end of 1942, and their construction was p ceeding very slowly.

Italy.—After allowing for losses, Italy's effective streng amounted to 6 or 7 battleships; 12 cruisers, excluding 2 vessels of insignificant value; 90 destroyers and seagoing torpe boats; perhaps 60 submarines, though without knowing the nu ber lost this is a very doubtful figure; 2 sloops; 1 aircraft tend 30 or 40 minelayers and minesweepers; and sundry smaller cr such as motor torpedo boats and trawlers. A dozen small cruis were under construction, but it was doubtful if any had pas into service.

Germany.—Germany's strength at sea amounted to 3 bat ships, 1 being under reconstruction; 2 armoured ships, kno popularly as "pocket battleships"; 1 aircraft carrier, incompl nfit for service; 6 cruisers; about 40 destroyers and seagoing do boats; 1 sloop; 2 coast defense ships; and an unknown er of submarines, motor torpedo boats and minesweepers, categories being the ones on which Germany was principally ng for carrying on the war afloat.

S.S.R.—Little more was known of Russian naval strength before its entry into the war. It included 3 obsolete battle-, 2 in the Baltic and 1 in the Black sea; 1 small aircraft car- 7 cruisers, of which 2 were in the Baltic and 5 in the Black about 90 destroyers and seagoing torpedo boats; 200 or more arines; and more than 100 motor torpedo boats. Vessels in ast three categories were divided between the Baltic, Black nd far east.

her European Countries.—The government of the Nether- had at its disposal at the end of 1942 a total strength of 3 ers, 3 destroyers, 3 old torpedo boats, 12 submarines, 3 s, 4 minelayers, 2 minesweepers, 5 motor torpedo boats and marine chaser.

rway retained under the control of its government in Lon- 2 seagoing torpedo boats, 2 submarines, 8 motor torpedo , 4 motor launches and a number of patrol vessels and mine- pers. Four destroyers and 5 corvettes of the British fleet manned by officers and men of the royal Norwegian navy.

e Danish fleet was entirely under German control. It in- d 2 coast defense ships, 2 destroyers, 17 torpedo boats and bmarines.

eden had been engaged in expanding its fleet, which com- l 2 cruisers, 7 coast defense ships, 16 destroyers, 6 seagoing do boats, 24 submarines, 1 minelayer, 42 minesweepers, 14 r torpedo boats, and sundry patrol vessels, etc. Under construction were 2 cruisers, 3 destroyers and 4 submarines. There was believed to be no prospect of the construction being undertaken of 2 coast defense ships which were projected.

There remained in the Finnish navy, so far as could be ascertained, a coast defense ship, 5 submarines, 10 minelayers, 7 motor torpedo boats and some gunboats and other small craft.

Poland, with the addition of new ships built in England, had 6 destroyers, 6 submarines (3 of them interned) and 3 patrol vessels.

Spain could dispose of 6 cruisers, 16 destroyers, 6 submarines, 6 old torpedo boats, 6 minelayers and 2 sloops. Under construction were 2 destroyers and 3 submarines.

Portugal possessed 5 destroyers, 3 submarines, 1 seagoing torpedo boat and 7 sloops. Turkey had an old battle cruiser, 8 destroyers, 12 submarines, 2 old cruisers used for training purposes, 5 minelayers and 3 motor torpedo boats.

With fresh ships built in England, the royal Hellenic navy had on active service 1 cruiser, 10 destroyers, 3 old torpedo boats, 4 submarines and 4 corvettes.

Rumania had 2 destroyers, 3 submarines, 2 minelayers, 3 motor torpedo boats, and sundry old vessels of minor importance, all of which were under German control.

In the Yugoslav fleet there were 3 destroyers, 4 submarines, 9 motor torpedo boats, an aircraft tender, a patrol vessel and sundry old craft of little value. All of these if still afloat were under Italian control.

South America.—Though the war suspended all construction in Europe of warships for South American states, Argentina, Brazil and Chile built some vessels in their own dockyards. The Argentine navy included 2 old battleships, 3 cruisers, 14 destroyers, 3 submarines, 4 old coast defense ships and 14 minesweepers. Two sloops were under construction. In the Brazilian fleet there

U.S. AIRCRAFT CARRIER sunk during World War II was the "Wasp," oed Sept. 15, 1942, off the Solomon Islands

Navies of the World as of Dec. 1942

Country	Battle-ships and battle cruisers	Aircraft carriers	Cruisers	Coast defense ships	Destroyers and seagoing torpedo boats	Sub-marines

Chile	1	..	3	..	8	9
Peru	..	..	2	..	2	4
Colombia	..	..	..	..	2	..
Thailand	..	..	..	4	11	3

Owing to the war, the figures relating to the first seven countries named above cannot all be taken as exact. The navies of Denmark, Finland, Rumania, Yugoslavia and Thailand were under enemy control. Old torpedo boats no longer in seagoing condition and motor torpedo boats (coastal craft) are not included in the above table. The two German "pocket battleships" are counted under the head of cruisers. French ships scuttled at Toulon have been omitted, for though they were lying in shallow water, they could not be made serviceable for a long time to come.

were 2 old battleships, 2 cruisers, 9 destroyers and seagoing torpedo boats, 4 submarines, 6 corvettes, 8 minelayers and 2 minesweepers. Seven destroyers were building at Rio de Janeiro. Chile had 1 battleship, 3 cruisers, 8 destroyers and 9 submarines. A sloop was being built and was probably completed.

Other South American navies underwent little change. Peru possessed 2 cruisers, 2 destroyers and 4 submarines. Colombia had 2 destroyers and 3 gunboats. Mexico could muster 5 sloops and some small patrol craft; Cuba, 2 sloops and some small gunboats; Uruguay, a sloop and 3 patrol vessels; Venezuela, 4 gunboats. Paraguay had 3 river gunboats. The Dominican Republic, Haiti and Nicaragua disposed respectively of 3, 2 and 1 patrol vessels.

Asia.—China had its navy almost extinguished as the result of Japanese aggression, but retained 4 river gunboats, 3 of which were presented by the British government and 1 by that of the United States. The Japanese set up a Quisling government under Wang Ching-wei and presented it with 2 cruisers, a sloop and 7 gunboats as the nucleus of a navy.

The Siamese Navy, completely dominated by Japan, included 4 coast defense ships, 1 destroyer, 10 torpedo boats, 3 submarines, 2 sloops and 8 motor torpedo boats. Two cruisers were ordered in Italy before the war, but had not been finished.

SINKING OF THE "YORKTOWN," second great U.S. aircraft carrier lost in 1942. Disabled June 2 by Japanese bombers during the battle of Midway, the carrier was fatally hit two days later by a Jap submarine

Iran possessed 2 sloops and 4 gunboats; Manchuria had an destroyer discarded by Japan and about 30 river gunboats patrol vessels. Iraq had 4 river patrol boats. Naylor, William Keith

(1874–1942), U.S. army offi was born Nov. 24, in Blooming Ill. He was graduated from Michigan Military academy, 18 and from the University of Minnesota, 1898. A veteran of Spanish-American War, he served as chief of staff of the 33rd vision on the western front in World War I. After the war held a number of important posts in the army intelligence, plans and war college departments until his appointment in 1 as professor of military science and tactics at the Universit Illinois. He was made a brigadier general in the same year retired from service in 1938. His book, *Principles of Stra* (1922), was used as an official textbook on strategy by the Ja nese army. He died in his summer home near Uniontown, Aug. 3.

Nebraska.

One of the states formed from the territory of Louisiana Purchase, Nebraska lies in the lo Missouri valley in the west north central part of the Un States; admitted to the union in 1867; area, 76,653 sq.mi.; p (1940) 1,315,834, a decrease of 62,129 from 1930; capital, coln (81,984). In 1940, 39.1% of the population was ur About 1% of the total population is Negro and about 8% fore born.

History.—Dwight Griswold, Republican, was re-elected go nor of Nebraska Nov. 3, 1942, for the term 1943–45. Other s officers elected for 1943–45 were: lieutenant governor, Roy Johnson; auditor, Ray C. Johnson; secretary of state, Fr Marsh; treasurer, Carl G. Swanson; chief justice, Robert G. mons. Alone among the 48 states, Nebraska has a one-house islature, the 43 members of which are chosen biennially on a partisan ballot.

Education.—Elementary and secondary education is lar under the control of local school districts, of which there more than 7,000 in 1942, with but slight supervision by a s intendent of public instruction. The total enrolment in ele- ary and secondary schools in 1941 was 267,103 and the teach- aff numbered 13,619. Expenditures amounted to $20,505,- Higher education is supported by the state at the University braska and in four teachers' colleges. The appropriation for ate university for the biennium 1941–43 was $7,733,454 and e teachers' colleges $1,370,410.

lic Welfare, Charities, Correction.—The state appro- on for public assistance for 1941–43 was $20,285,362. Dur- e year ending June 30, 1942, the average monthly number rsons receiving general relief was 6,882 and average ly payments were $100,557; persons employed on WPA ts averaged 11,739 per month and received during the year 1,273; during the same year recipients of aid to dependent en numbered 12,731 and received $2,032,637, while moth- ensions, paid by the counties, amounted to $138,518; 737 persons received $187,490. The state maintained 7 correc- institutions with a total of 1,173 inmates in June 1942 and hers for dependents with a population of 6,648; 2,894 in- were on parole at the same date. The total appropriation e 17 institutions for the period 1941–43 was $4,692,374.

mmunications.—The total highway mileage of the state in was 100,987. Of this 11,320 mi. had been designated as part state system of highways and 9,157 mi. had been marked ere maintained by the state. Of this latter figure, 3,984 mi. hard surfaced, 4,915 gravelled and 258 of earth. The total bligated for new construction during 1940 and 1941 was 34,243, from both state and federal sources. As of Nov. 1, there were 22 airports in the state, 20 of which were man- by municipalities, in addition to an undisclosed number of lly-maintained auxiliary landing fields. Total railway mile- the state in 1942 was 8,502. Thirteen radio stations oper- rom points within the state in Nov. 1942, six of which were d in Omaha and Lincoln.

king and Finance.—State banks numbered 279, a decrease from 1941. Total assets in 1942 were $107,497,766. There lso 47 building and loan associations with assets of $56,611,- 11 industrial loan and investment companies with resources ,761,176; and 176 co-operative credit associations with as- f $3,929,356. National banks at the same date numbered ith resources of $388,673,000.

total assessed value of the state in 1942 was $2,042,442,- The tax rate for state purposes was set at 2.39 mills, calcu- to produce $4,881,437. The biennial budget for 1941–43 d appropriations of $60,909,869 of which $15,600,600 comes federal funds. There is no state tax on personal or corpo- ncomes, or on sales. The state has no bonded debt, though f the local subdivisions in 1941 amounted to $77,926,000. figure does not include the indebtedness of the many public districts, which is estimated to amount to more than 0,000.

riculture.—The total acreage harvested for the crops listed ble I in 1941 was 13,608,000. In addition, an undetermined er of acres of wild hay was exploited. The total farm income same year was $306,407,000, divided as follows: crops, 52,000; livestock, $222,046,000; government payments, $15,- 0. A large annual deficiency in rainfall during the period 41 was reflected in a sharp decline in the cash incomes of cers. Better growing conditions in 1942 resulted in much yields.

nufacturing.—The value of all manufactured products in —the last year for which complete figures were available in —was $273,524,500. In that year, 1,161 establishments em- d 3,642 salaried persons and 18,810 wage earners and paid es and wages amounting to $28,135,500. World War II greatly increased manufacturing activity in the state, but no figures were available in 1942 as to the value of products or wages paid.

Table I.—*Leading Agricultural Products of Nebraska, 1942 and 1941*

Crop	1942	1941
Corn	242,984,000 bu.	157,638,000 bu.
Wheat	69,828,000 bu.	36,194,000 bu.
Oats	56,794,000 bu.	54,280,000 bu.
Barley	38,268,000 bu.	48,832,000 bu.
Potatoes	11,988,000 bu.	9,620,000 bu.
Sugar beets	1,078,000 tons	927,000 tons
Alfalfa hay	...	1,106,000 tons

Table II.—*Principal Industries of Nebraska, 1939 and 1937*

Industry	Value of products	
	1939	1937
Meat packing	$117,743,576	$112,708,382
Creamery butter	21,133,891	23,291,846
Flour and mill products	17,485,317	25,524,100
Poultry dressing and packing	8,807,209	5,949,969

Mineral Production.—The state has no mineral wealth of consequence. Petroleum was discovered late in 1939 and by June 30, 1942, 85 wells had produced 3,900,000 bbl. This, however, is not a significant part of the national output. (L. W. L.)

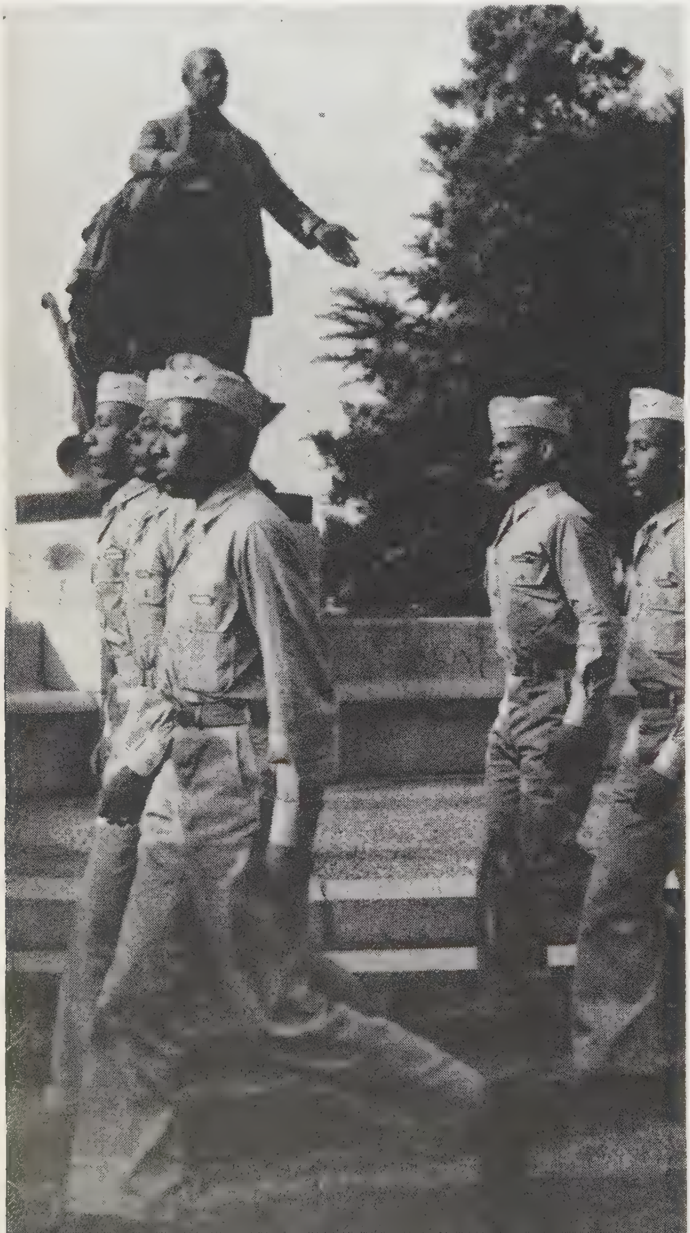
Negroes (American).

After a slow start because of a policy of separate service units, Negro selectees during 1942 attained their proportional representation in the armed services. Despite initial exclusion from the navy except as messmen and from the marine corps, policies dropped under public pressure in April 1942, Negro volunteers were 16.1% of the national total, with the Negro population ratio only 9.8%. An all-Negro division (93rd) was activated at Fort Huachuca, Ariz., and more recently another, (92nd) at Fort McClellan, Ala. National guard units and early selectees formed the basis for a number of expeditionary units of Negro soldiers serving overseas, according to O.W.I. in Great Britain, Ireland, North and West Africa (including Liberia), Australia, New Guinea, Hawaii, Alaska and the West Indies. A few crack units of guard and anti-aircraft detachments were assigned to guard duty in New England and the Middle Atlantic seaboard states. Concentration of Negro trainees in southern camps, as well as their wide dispersal abroad in areas like Australia and England particularly, raised unusual tensions for which the separate unit policy of the armed forces was itself mainly responsible. The domestic issues were met after some instances of threat and violence by unofficial pressure of the military authorities on recalcitrant elements in these communities and by the belated appointment of larger numbers of Negro military police. Abroad, the problems were raised mainly through the conflict of local social customs with American caste traditions, which even in Australia were settled generally in favour of nondiscrimination for the Negro soldiers. The new policy of training Negro officer candidates at common centres without discrimination was successful, even in southern camps, which augmented the public demand for dropping all differentials in the armed services. Petitions and mass meetings advocating volunteer mixed battalions and also for eliminating limited air cadet quotas and limited service and advancement policies in the navy and marine corps, announced when their exclusion policy was relaxed, increased. The initial naval training centre, Camp Robert Smalls, at Great Lakes, the navy technical training centre at Hampton, Va., and the first Negro marine corps unit all progressed successfully with full volunteer quotas. Negro tank troop units were trained at

Fort Knox, where the parade ground was named for Pvt. Robert H. Brooks, Negro tank corps soldier, first American casualty of the Philippine campaign. Dorie Miller, the mess attendant who heroically manned an anti-aircraft gun on a battleship during the Pearl Harbor attack, was decorated June 20 by Admiral Nimitz with the navy cross, after considerable agitation for his recognition. Precedents were thus set, if only in some instances by token recognition, for a much wider and more democratic participation of the Negro in the armed services.

Gains similarly were made, principally under the pressure of the Fair Employment Practices committee, but also from that of liberal and Negro public opinion, toward the fuller integration of the Negro in civilian war defense efforts, particularly war industry. Numerous companies and plants were cited in the committee's regional hearings for noncompliance with the presidential order against racial discrimination in war industry. But very substantial gains in numbers and upgraded types of employment occurred, especially in concerns controlled by the C.I.O. union organizations. The A.F. of L. unions dropped discriminatory clauses in compliance with the same order and were gradually curtailing skilled craft exclusion policies. The National Maritime union brought Negro merchant marine quotas to 10% vindicated a policy of mixed crews. One of the liberty s named for Booker T. Washington and christened by M Anderson, was placed in charge of a Negro captain, Hug Mulzac, and successfully completed its maiden voyage wi mixed crew.

NEGRO FLIERS in training on the campus of Tuskegee institute, Ala., first U.S. army air school for Negroes. Members of the first graduating class—five young lieutenants—received their wings March 7, 1942. In the background is a statue of Booker T. Washington, founder of Tuskegee institute



Civil and Economic.—Several states, after the lead of York, passed nondiscrimination legislation for war defense porations and contracts (the Schwartzwald bill), and the Production board and the War Manpower commission annou policies to the same effect. Protests from reactionary sourc Georgia, Florida and Alabama were only able to slow down trends, but such efforts were successful in their campaig defeat the anti-poll tax bill by a senate filibuster afte passage by a considerable majority of the house. The move for the equalization of teachers' pay extended to eight s with the Florida case favourably decided by court action. residence restriction cases were reversed in St. Louis and District of Columbia, and the U.S. supreme court declared Georgia Contract Labor law unconstitutional and govern prosecutions were started on several cases of peonage. Southern Conference on Race Relations promulgated a program of full Negro rights and full participation in the effort at Durham, N.C., Oct. 20, which focused liberal sou opinion and objectives.

Educational and Cultural.—The *Crisis* annual surve vealed 34,834 Negro college students enrolled, with 4,353 g ates and 350 higher and professional degrees taken. The R wald fund announced, along with its usual quota of fellow the unusual record of its former recipients including electi three to faculty posts at the University of Chicago, H College and the College of the City of New York.

On the literary scene a significant new prose writer, J. Sau Redding, appeared with his critique of contemporary Negro *No Day of Triumph* and Margaret Walker, a young woman was awarded the Yale University Younger Generation P Prize with the publication of her *For My People.* Joe L prior to army service, ended a sensational sports career championship bout in which he donated his share of the pro to the Navy Relief fund. Nehru, Jawaharlal

(1889–), Indian statesman born of wealthy parents and was cated in England at Harrow and Old Trinity college, Camb Nehru learned to speak several Indian tongues fluently, an his return to India he immediately took up the cause of I independence. He became a member of the All-India Con committee in 1918, was arrested repeatedly for political off and was associated with the various civil disobedience moven in India after 1921. He was twice president of the I National congress, 1929 and 1936. In Aug. 1940, Nehru dec that India would throw her full weight into a struggle ag the axis only if Britain would grant her complete independenc Nehru came out for the Allied cause after the Japanese a on Pearl Harbor. Although he rejected the compromise posals brought to India by Sir Stafford Cripps in March he opposed Gandhi's refusal to consider a scorched earth in the event of invasion. Nehru was arrested along with high Indian leaders shortly after the launching of the civi obedience movement in Aug. 1942.

elson, Donald Marr (1888–), U.S. business executive, was born Nov. 17 at annibal, Mo., and was graduated from the University of Mis- ouri in 1911. The next year he was employed by Sears, Roe- ick and company as a chemical engineer. In 1927 he was ap- ointed general merchandise manager of the company, in 1930 ce president in charge of merchandising, and in 1939 executive ce-president and chairman of the executive committee.

He served with the National Defense Advisory commission uring 1940. In the Office of Production Management, created n. 7, 1941 by President Roosevelt, Nelson was appointed di- ctor of the division of purchases and thus assumed responsi- lity for buying billions of dollars of material for the defense ogram. On Aug. 28, 1941 he was named executive director of e Supply Priorities and Allocations board and priorities director the OPM.

On Jan. 13, 1942, President Roosevelt announced creation of e War Production board to supplant the SPAB, and appoint- ent of Nelson as chairman of the board, with supervision over e war procurement and production program. He was given thority to determine the policies, plans, procedures, and meth- s of the several federal departments, establishments and agen- es in respect to war procurement and production, including rchasing, contracting, specifications and construction; and in- uding conversion, requisitioning, plant expansion and the financ- g thereof.

Nelson thus received executive powers equivalent to those of rnard Baruch in World War I.

The first phase of the immense task given Mr. Nelson was at of converting the nation's industrial economy from a peace a war basis. This task he tackled energetically and swiftly; tween January and June 1942, he halted the manufacture of s essential civilian goods, speeded plant conversion, and facili- ted the flow of raw materials to the war plants. As the size of e war production program continued to grow, the materials oblem became more and more acute, making imperative the eation of a balanced program and rendering the old priorities stem nearly obsolete; to meet this situation the Controlled aterials plan was instituted late in 1942, allocating the most tical raw materials direct to war plants, and the WPB Re- irements committee was set up to pass on all claims for critical aterials made by any government agency in the war program.

As 1942 ended, it became apparent that the war program was tering a second phase. The work of expansion and conversion s largely finished; necessary now was a period of intensive ltivation, in which the most effective possible use should be ade of the materials, machines and plant capacity available. bring WPB into proper alignment to meet this new problem, r. Nelson on Nov. 11 revamped the organization, concentrating power over the allocation and distribution of materials in the nds of Vice Chairman Ferdinand Eberstadt, and giving to ce Chairman Charles E. Wilson responsibility for the produc- on of war goods. After extensive discussion with the heads of e armed services, it was announced on Dec. 4 that Mr. Wilson ould assume general responsibility for the scheduling of all mili- ry production and would concern himself specifically, immedi- ely, with production programs for aeroplanes, escort vessels d radio equipment.

At the close of his first year as chairman of the War Pro- ction board, therefore, Mr. Nelson had performed the bulk of e spade work incident to putting the economy on a full war sis, had realigned his own organization so that it could handle new tasks efficiently, and had set up the machinery by which ntrol of production and control over the flow of materials uld be properly integrated and synchronized.

Nepal. An independent kingdom (area *c.* 54,000 sq.mi., est. pop. 5,600,000) lying between India and Tibet—and including Mt. Everest—ruled in fact in 1942 by the prime minister, Maharaja Sir Joodha Shumshere Jung Bahadur Rana. In 1942 no news of any change in the personnel or methods of government was received. The prime minister and *de facto* ruler remained, as before, a firm friend of Britain. The active assistance which the Nepal government gave to the British arms was substantial.

It assented readily to its Gurkha regiments being sent overseas if necessary, and it raised 20 additional battalions for the Indian army, recruiting 14 times as many men as in ordinary years. The maharaja also contributed generously to various war funds and charities.

In Feb. 1942 Gen. Chiang Kai-shek in India took the salute at a review of troops which included a Nepalese contingent.

The British envoy in 1942, Lt. Col. Geoffrey Lawrence Betham, presided at the capital, Katmandu (pop. *c.* 80,000).

Nervous System. In 1942 certain advances were made regarding the diseases of the brain, spinal cord, peripheral and sympathetic nervous system. These were:

Poliomyelitis.—An additional concept regarding the source of the infection in infantile paralysis (anterior poliomyelitis) was developed. The almost constant involvement of the alimentary tract and the central nervous system along which the initial invasion of the virus probably occurs calls for a reinvestigation of the pathogenesis of poliomyelitis. This may result in a method of preventing poliomyelitis. The National Foundation for Infantile Paralysis will contribute financial support to such studies. In clinics throughout the United States the new Kenny treatment was tried. This type of management was found to be helpful in relieving pain and spasms and preventing contractures. (*See* also ENDOCRINOLOGY; INFANTILE PARALYSIS; MEDICINE; VITAMINS.)

Shock Therapy.—Electric shock therapy was used more often than either insulin or metrazol. It was applied easily and caused practically no complications. Fractures and dislocations occurred rarely. There were no deaths reported from its use. Schizophrenia and mental depressions were the two most common diseases treated. (*See* also PSYCHIATRY.)

Selective Service.—There were less mentally involved conscripts inducted into the armed forces in 1942 than in 1941. This was due to more careful inventories and examinations on the part of the physician in the induction centre as well as the special neuropsychiatric consultants.

Intracranial Arterial Aneurysms.—A new operation was developed for the removal of aneurysms within the cranial cavity. The treatment of aneurysms of the internal carotid artery is relatively simple. It is necessary only to isolate the aneurysms when they lie within the cranial cavity. These new procedures have resulted in total cures.

Trigeminal Neuralgia.—A new surgical approach tractotomy was developed for trigeminal neuralgia because it prevented the development of pin and needle sensations. Touch sensation was completely preserved.

Epilepsy.—Studies of the specific gravity of the blood and blood serum of epileptic patients revealed that it is difficult to induce hydration by excessive oral fluid intake supplemented by antidiuretic measures. Epileptic patients may drink all the water they wish.

(T. T. S.)

Netherlands.

A kingdom of northwest Europe. Bounded N. by the North sea, E. by Germany, S. by Belgium, and W. by the North sea. Occupied by German armed forces in May 1940. National flag, red, white and blue, in equal horizontal stripes. Area 13,440 sq.mi.; pop. (est. Dec. 7, 1941) 9,000,000. Chief towns (pop. Dec. 31, 1938): Amsterdam (cap. 793,526); Rotterdam (612,372); The Hague (pre-war seat of the government 495,518). Language: Dutch; religion: Christian (1930 census, Dutch Reformed Church 2,732,333; Roman Catholic, 2,890,022). Ruler: Queen Wilhelmina; president of the council of ministers, Prof. P. S. Gerbrandy.

History.—Throughout 1942 the Germans intensified their efforts to make use of the resources and manpower of the Netherlands, but the spirit of resistance remained immovable and consequently the German rule became more oppressive. In the spring it was announced that all labour organizations were to be rearranged in the *Arbeidsfront,* and unsuccessful attempts were made to induce former trade-union leaders to join this body, of which the main purpose was to make industrial discipline more severe. A new series of anti-Semitic measures began with the compulsory wearing of the Jewish star and was soon seen to be preparatory to the forcible deportations of Jews to work in Germany or further to the east which were carried out from August onwards. In June came the first announcements of the "Netherlands East Company" and other related schemes. In these the leading figure was Rost van Tonningen, the intruded head of the Netherlands Bank. His plan was to form a company, with capital compulsorily diverted from other undertakings, and so to finance Dutch settlement on a vast scale in the occupied countries to the east of Germany. Industrial as well as agricultural plant and personnel were to be transferred, the whole scheme being in the interests of the German war effort but supported by propaganda representing it as providing a new outlet for Dutch colonial enterprise.

These plans aroused no response among the people as a whole and alienated some of the Dutch National Socialists. Anton Mussert, their "Leader," already jealous of Rost van Tonningen, made a show of standing up for some shred of Dutch independence against extreme Germanizing tendencies; though his followers had been bound by a new oath more closely to him and to the Germans. On several occasions during the year it was announced that patriots had been shot for various offenses such as circulating clandestine pamphlets. In May there was an incident of this kind on a greater scale than ever before: 96 victims, including a number of army officers were shot. All the officers of the army who had been at liberty were taken into custody as prisoners of war, and, after a visit of Reinhard Heydrich shortly before his death, more than a thousand persons, selected from all walks of life, were seized as hostages. Five of these hostages were shot in August after the bombing of a troop-train near Rotterdam.

The Netherlands government in London announced that these crimes would in due course be punished, and that the death penalty would be exacted for treason. The year was one of strenuous activity for the government, two notable events being the requisitioning of all Dutch shipping and the appointment of Pangeran (Prince) Ario Soeyons as minister without portfolio, the first Indonesian to hold cabinet rank. The visit of Queen Wilhelmina (*q.v.*) to Canada and the United States made a deep impression.

(G. N. C.)

Education.—In 1938: elementary schools, 7,812; scholars, 1,242,778; secondary schools, 288; scholars, 62,301; high schools (1937–38), 4; scholars, 3,037; universities (1937–38), 6; scholars, 9,471.

Finance.—Revenue, ordinary (est. 1940) 741,096,000 florins; expenditure, ordinary (est. 1940), 740,548,189 florins; public de (May 31, 1942), 7,449,000,000 florins; notes in circulation (Oc 10, 1942), 2,724,143,000; gold reserve (Oct. 10, 1942), 917,809 474 florins; exchange rate (average 1940), 1 florin=53.19 U. cents.

Trade and Communication.—Trade (merchandise) import 1938: 1,414,768,000 florins; 1939: 1,516,651,000 florins; expor 1938: 4,039,156,000 florins; 1939: 966,215,000 florins. Commun cations and transport, 1938: roads, suitable for motor traffic, 8,53 mi.; railways, open to traffic, 2,278 mi.; rivers and canals, nav gable, 4,817 mi.; airways, distance flown, 6,629,000 mi.; shippi (June 30), 2,855,400 gross tons; launched (July 1938–June 1939 246,400 gross tons; entered with cargoes, 27,606,524 net ton cleared with cargoes, 23,151,428 net tons. Motor vehicles licens (Aug. 1, 1938): cars, 94,000; buses, 4,088; trucks, 50,988; cycle 55,140; wireless (June 30, 1939): registered receiving sets, 83 542; connections with radio-distributing systems, 368,710.

Agriculture, Manufactures, Mineral Production.—In metr tons (1939 actual figures): wheat, 416,523; rye, 603,532; barle 146,041; oats, 449,241; pulse, 185,891; sugar beet, 1,716,05 flax, 152,487; cotton goods (1938), 136,565,000 guilders; machi ery (1938), 99,821,000 guilders; coal, 12,861,000; salt, 199,80 pig iron and ferro-alloys (1938), 276,600; zinc, 20,500. n were apparently not molested, though they were much im- verished and were able to live only by organizing mutual help. tle was known of the behaviour of the Japanese towards indi- ual Europeans, but in June the aged Roman Catholic Arch- hop Aerts, of the island of Kai, was murdered.

The Japanese occupation, by cutting off foreign trade, de- oyed the delicate economic balance on which the Dutch policy welfare depended, and put an end to the progress of industrial- tion and resettlement, by which alone the population-problem Java could be met. There was very little trustworthy news m any part of the Dutch Indies, and the Japanese made claims ich were certainly false in regard to the starting-up of the oil ustry and of mining in places where plants were destroyed dur- the invasion. Although details were scanty, it was clear that re was universal shortage, in places even a shortage of rice, and at industrial depression. The standard of living of the natives fered severely, where there was already too little to spare. ance appeared to be completely disorganized, and earnings re cut down. There was evidence of confiscations of land from ives for Japanese purposes.

The indigenous population was subjected to much Japanese paganda, but did not respond, and did not imagine that Japan uld countenance the national aspirations which were moving vards realization under Dutch rule. Japanese attempts to set puppet governments failed completely.

In the Netherlands West Indies there were no changes of ater moment than the arrival of a new governor and the visit Prince Bernhard. (*See* also CURAÇAO; DUTCH EAST INDIES; ORLD WAR II.) (G. N. C.)

utrality: *see* INTERNATIONAL LAW.

evada. A western state, popularly known as the "Sagebrush" or "Silver" state was admitted into the union on t. 31, 1864. Area, 110,540 sq.mi.; pop. (1940) 110,247. Of population 39.3% were urban; 93,431 were native white, only 599 were foreign-born white. Capital, Carson City (2,478); ner cities: Reno (21,317); Las Vegas (8,422); Sparks (5,318); y (4,140); Elko (4,094); Winnemucca (2,485); and Fallon ,911).

History.—Nevada in 1942 geared itself to war. The naval oject at Hawthorne, the Reno air base at Lemmon Valley and $100,000,000 magnesium plant at Las Vegas caused great tivity and increase in population. A curtailment in precious tal mining caused a serious setback in many sections.

The democratic party made a clean sweep in the general elec- n of Nov. 3, re-electing E. P. Carville governor; other officials cted were: lieutenant governor, Vail Pittman; secretary of ate, Malcolm McEachin; attorney general, Alan H. Bible; state asurer, Dan W. Franks; state controller, Henry C. Schmidt; perintendent of public instruction, Mildred Bray; U.S. sena- rs, Pat McCarran and J. G. Scrugham. Representative in ngress, Maurice J. Sullivan; chief justice of the state was illiam E. Orr.

Education.—In 1942 there were 234 elementary schools with a total enrolment of 19,432 pupils, staffed by 701 teachers. On Jan. 1, 1943 there were 41 high schools with a total enrolment of 6,277 pupils staffed by 298 teachers. On Jan. 1, 1943 the total school enrolment was 26,710, including 1,001 kindergarten pupils.

Public Welfare, Charities, Correction.—The amount spent for public assistance for the fiscal year ending June 30, 1942, was $29,375.51; for social security and old-age assistance, $839,340.83. On Jan. 1, 1943 the state prison had 218 inmates; total expenditures of the fiscal year ending June 30, 1942 were $130,913.92. The state industrial home had 43 inmates, expenditures, $20,107.52; the state hospital for mental diseases had 347 patients, expenditures were $106,868.51; the orphans' home had 39 inmates on Jan. 1, 1943 and expended $30,105.60 during the fiscal year.

Communications.—On Jan. 1, 1943 there were 5,518 mi. of roads in the state-designated highway system, 3,064 mi. of which were hard surfaced and 2,454 mi. improved but not paved. Expenditures were $4,411,860.39 for the fiscal year ending June 30, 1942. On Jan. 1, 1943 there were 1,830.28 mi. of railroad trackage in the state. On the same date there were 11 standard airports and 24 secondary airports in Nevada.

Banking and Finance.—On Jan. 1, 1943 there were six state banks; their deposits as of Dec. 31, 1942, were $8,579,091.10, total resources $9,190,379.78. On Jan. 1, 1943 there were six national banks. The First National bank of Nevada had nine branches throughout the state and the Ely national had one branch at McGill. These banks had total deposits as of June 30, 1942 of $50,738,257.98 and total resources of $54,831,479.56. On Jan. 1, 1943 there were two savings and loan associations with resources of $282,670.20.

State receipts for the fiscal year 1941–42 were $8,797,892.32; disbursements $8,180,455.90.

Agriculture.—The total value of agricultural production in 1940 (U.S. Census) was $12,132,935, and total acreage harvested was 451,688. The cash income from crops and livestock was $15,334,158. During 1942 the livestock and agricultural industries showed greatly increased activity and, enjoying plentiful rains, recorded large increases to meet the war demand. According to 1942 census release, land acreage in farms was 3,624,536 and the value of irrigated farms was $46,392,883. Irrigated farms totalled 3,264 and nonirrigated farms 309.

Manufacturing.—The total value of manufactures, according to the U.S. biennial census of 1939, was $32,309,219. The average number of employees was 1,169, and the total wages paid $2,151,292. The number of manufacturing establishments was 105 and the principal manufactures were printing products, brick, clay, iron and steel products and automobile parts.

Mineral Production.—The total value of gold, silver, copper, lead and zinc production in 1941 was $38,873,169. Gold produc-

New Brunswick.

One of the three maritime provinces of the dominion of Canada (*q.v.*), admitted to the union in 1867; area 27,985 sq.mi.; pop. (1941) 457,401, of whom 97% were native born. Capital, Fredericton (9,905). Other cities are Saint John (50,084) and Moncton (22,411). The lieutenant governor in 1942 was W. G. Clark and the premier was J. B. McNair.

Education.—The number of students in provincially controlled public schools in 1942 was 96,470; in private schools, 3,015; in institutions of university standard, 1,297.

Communications.—The mileage of surfaced highways in 1942 was 8,455; earth highways 3,840; provincial expenditure on highways, $1,193,404. The railroad mileage was 1,848 in 1942; the number of telephones, 35,798.

Finance.—The ordinary receipts in 1942 were $12,459,611; expenditure, $11,921,467. The direct debt (less sinking funds) was $97,043,223; indirect liabilities (less sinking funds) $2,741,509.

Agriculture.—The acreage of field crops in 1942 was 878,800; gross values of field products, $24,315,000; gross value of all crops, $31,090,000.

Newfoundland and Labrador.

A British colony North America, w suspended constitution. Area: Newfoundland 42,000 sq.mi.; L rador 110,000 sq.mi.; total 152,000 sq.mi.; pop. (est. Dec. 1938): Newfoundland, 290,660; Labrador, 4,780. Chief town capital: St. John's (pop. 1941: 39,886). Governor (1942): Humphrey Walwyn; language: English; religion (1935 censu Roman Catholic, 93,925; Church of England, 92,732; Un Church, 76,100; Salvation Army, 18,054.

History.—During 1942 the membership of the commission government for Newfoundland remained unchanged, but the t of office of the governor, Vice-Admiral Sir Humphrey Walw was again extended, to 1943.

The financial year ended June 30, 1942 was the most succes in the island's history. Revenue reached the record figure $23,294,300 and the budget surplus amounted to more t $7,000,000. The financial year was changed to run from Apr to March 31. The estimate for the period July 1, 1942 to Ma 31, 1943 provided for a surplus of $848,500, taking into acco the probable shrinkage in customs revenue due to the world sh age of supplies and shipping, but indications were that the plus should considerably exceed the original estimate. The m factor in Newfoundland's prosperity was that the labour nee for defense works undertaken by the U.S.A. and Canada mean total absence of any able-bodied unemployment. As a result Newfoundland government and people not only did without fin cial assistance from the British government, but also made ge ous contributions to the united war effort. The sum of $6,100, had been advanced to the United Kingdom exchequer as n interest bearing loans, while further similar loans amounting $700,000 were made from the proceeds from the sale of savi certificates. More than 10,000 Newfoundlanders had voluntee for service abroad with the fighting services, the mercantile rine and the Newfoundland forestry unit.

Clement R. Attlee, British secretary of state for domin affairs, visited Newfoundland in September.

Legislation to effect the adoption of a system of compuls and free elementary education for children up to the age of years was enacted during the year.

Education.—In 1940: schools, 1,898; scholars on rolls, 66,508; ave attendance, 70.2%.

Banking and Finance.—Revenue, ordinary: 1940–41 $16,187,505, 1941 $23,294,300; expenditure: 1940–41 $15,490,974, 1941–42 $15,500,0 public debt (June 30, 1941), $2,412,773 and £19,980,012; notes in culation (June 30, 1941), $13,535; exchange rate same as Canadian do

Trade and Communication.—Overseas trade 1940–41 (merchandise):

FORT PEPPERELL barracks rose from the barren wastes of Newfoundland in 1942 to quarter U.S. soldiers stationed there

:s, $35,484,323; exports, $36,723,352; re-exports, $606,463. Com- iications Dec. 31, 1938): roads, main 1,150 mi.; secondary and local, ›o mi.; railways, open to traffic, 747 mi.; motor vehicles licensed 40): cars, 4,429; trucks and buses, 1,340; cycles, 154; telephones 40) 10,588.

ineral Production and Fisheries.—Fisheries 1940: cod (inshore, deep sea Labrador), 87,549 metric tons; seal, $205,030; salmon (export), 0,336 lb.; lobster (export), 2,477,289 lb.; fish oils (export), 1,826-, lb. In metric tons (1940): wood pulp (1938), 242,000; iron ore tal content), 797,000; lead ore (metal content), 25,500; silver, 46.5; , 678 kg.

w Guinea: *see* Dutch East Indies; Mandates; Pacific ands, Mandated; Japan; World War II.

w Hampshire.

One of the New England group of states and one of the original states of the on, popularly known as the "Granite state"; area, 9,304 sq.mi.; . (1940) 491,524. Of the total population, 283,225 or 57.6% e urban, and 208,299 rural. Capital, Concord (27,171). Other es: Manchester (77,685), Nashua (32,927), Berlin (19,084), ver (14,990) and Portsmouth (14,821).

listory.—The general court was not in session during 1942. the November election of 1942, Robert O. Blood (Repub- n), was re-elected governor by a vote of 83,766 over 76,782 William J. Neal (Democrat). H. Styles Bridges (Repub- n) was re-elected U.S. senator by a vote of 88,601 over 73,656 Francis P. Murphy (Democrat). In the same election the ers approved the amending of the state constitution so as to nit the reduction of the house of representatives from 443 nbers to a number between 375 and 400.

uring 1942 the activities of the state council of defense created 941 were greatly extended, and an increase of the New Hamp- e state guard to four battalions was authorized.

ducation.—In 1941–42 there were 1,854 public schools. The l number of elementary pupils was 51,771, with 2,060 hers; the number of high school pupils, 20,744, with 991 hers. Total payments for public education during year end- June 30, 1942, $7,856,373.

ublic Welfare, Charities, Correction.—In Jan. 1942 there 5,884 cases on general relief, with an expenditure of $156,- as compared with 4,259 cases in the following September, 1 an expenditure of $107,112. Expenditures for public assist- under the Social Security act tended to increase somewhat, ough the peak of old-age assistance appeared to have been hed in July with an expenditure of $176,158. Monthly aid to endent children steadily increased, amounting to $41,586 in tember. During the fiscal year ending June 30, 1941, there disbursed from the New Hampshire unemployment compen- on fund $6,211,865.28.

n Jan. 1, 1939, there were 269 persons in prisons and re- natories in New Hampshire. The appropriation for the state on at Concord for the fiscal year ending June 30, 1942, was 5,540.

ommunication.—Rural highways and urban extensions unted in 1939 to 3,613 mi. State highway funds disbursed in totalled $8,386,000. In 1939 there were 1,003 mi. of steam roads in the state.

anking and Finance.—As of June 30, 1942, there were in Hampshire 52 national banks with deposits of $93,734,000 resources of $108,971,000. Forty-three savings banks and savings departments of 8 trust companies reported deposits of $206,645,049 as of June 30, 1942. The combined resources of 43 savings banks and 12 trust companies on June 30, 1942, were $241,675,814. There were 25 building and loan associations with resources of $13,778,162.

Cash receipts of the state treasury department for the fiscal year ending June 30, 1942, $32,181,057.51; cash disbursements, $31,218,074.56; cash balance, $5,403,857.33. Gross fixed bond and note debt, June 30, 1942, $15,652,000; total net bonded debt, $12,700,913.12.

Agriculture.—Gross farm income for 1940 was estimated at $25,000,000, as compared with $26,000,000 for 1939.

Manufacturing.—Total estimated value of manufactures (1939), $237,396,015. Salaried personnel, including officers and employees, 4,593; salaries, $10,483,983. Wage earners, 55,781; wages paid, $52,735,240.

During 1939–42 population shifts caused by the expansion of war industry led to many new problems of housing, health, etc., particularly in the vicinity of the Portsmouth navy yard.

Mineral Production.—Total value of minerals produced in 1939 was $1,187,339. Efforts were being made in 1942 to open additional mica mines, to help meet war demands. Twenty-five mines were in operation and it was proposed to double the number. (W. E. Ss.)

New Hebrides: *see* Pacific Islands, British; French Colonial Empire.

New Jersey.

Sometimes called the "Garden state," New Jersey is one of the three middle Atlantic states. Area, 8,224 sq.mi.; pop. (1940) 4,160,165. Capital, Trenton (124,697). The largest city is Newark (429,760); second is Jersey City (301,173).

History.—The year 1942 witnessed a resurgence of the Republican party in New Jersey which culminated in the election of Albert W. Hawkes to the United States senate. He defeated the incumbent Democrat, William H. Smathers of Margate City, by more than 84,000 votes in a bitterly fought contest. Smathers had the support of Mayor Frank Hague, Democratic leader, and based his plea for re-election on his unswerving loyalty to the New Deal and the Roosevelt administration. Despite a majority of 115,000 rolled up by the Hague machine in Hudson county, Smathers succeeded in capturing only two other counties, Camden and Middlesex, by slight majorities.

Smathers had the endorsement of many leaders of organized labour, both C.I.O. and A.F. of L., and directed his attack on Hawkes as a former president of the United States chamber of commerce. The Democratic nominee did not, however, have the support of Democratic Governor Charles Edison, who refused to endorse his candidacy despite the appeals of party leaders outside Hudson county. The governor's aloofness from the Smathers campaign had its origin in his bitter feud with Mayor Hague.

Smathers had sponsored the nomination in the senate of Thomas

F. Meaney as a judge of the United States district court in New Jersey but Edison had fought Meaney's confirmation before a committee of the senate. The nomination eventually was confirmed, but Gov. Edison thereafter parted political company with Smathers. This division in the party largely accounted for the Democratic defeat in the election. The Republicans picked up another seat in the house of representatives, thereby making the state's congressional delegation 11 Republicans and 3 Democrats, and won overwhelming control of the state legislature. The 1943 assembly became Republican, 46 to 14, and the senate Republican, 18 to 3.

Throughout 1942 Gov. Edison had striven unsuccessfully to advance the cause of constitutional revision. In public speeches and in direct appeals to the legislature, the governor had sought to obtain first a convention and then a referendum on revision of the constitution. The governor maintained that New Jersey's constitution, adopted in 1844 and amended little during its nearly 100 years, was outmoded and that it deprived the governor of necessary executive authority, was responsible for an unwieldy superstructure of boards and bureaus, none of them responsive to the chief executive, and fostered an antique court system resulting in needless litigation, delay and expense.

The constitutional crusade was generally supported by the state press. Speakers' bureaus were organized, and many civic organizations endorsed the movement. Mayor Hague's organizations opposed the plan, but the chief opposition originated in the state senate. Many rural senators believed their counties, numerically inferior, would lose their senate representation if a new constitution were submitted for popular vote.

Differences between Gov. Edison and Mayor Hague on the constitution marked only one aspect of their intraparty conflict. The governor early in 1942 ousted the Hudson county tax board, an important cog in the Hague machine. Edison, after a hearing lasting several weeks, appointed a new board which began immediately to reduce Hudson county assessments, particularly Jersey City assessments, on the score they were inflated and did not represent equitable valuations. Mayor Hague responded with renewed attacks on the governor as being instrumental in compromising railroad taxes long overdue, with accumulated penalties amounting to more than $20,000,000. The attorney general, David T. Wilentz, brought suit in the court of chancery to outlaw the compromise settlement, which had been ratified by the legislature.

New Jersey's great factories and plants, operating around the clock, were interrupted spasmodically and briefly, or not at all, by labour disputes. The war, however, left its imprint on resort communities along the New Jersey coast. Boardwalks, streets and amusement piers were dimmed out, and many of the large hotels in such resorts as Atlantic City and Asbury Park were taken over as quarters for the armed forces.

Education.—For the fiscal year 1941–42, total enrolment of day students in public schools was 719,623, a decrease of 13,326. Teachers numbered 29,513. Total salaries were $61,673,907, averaging $2,123 a year. Total school buildings numbered 2,090. There were 19,345 adults given instruction in various war training programs by 451 teachers. Total cost of the public school system was $108,607,744.

Public Welfare, Charities, Correction.—Direct relief declined as employment rose in war industries during 1942, reversing the trend of the previous year, when 26,973 cases were reported (March 1941).

The 1941 appropriation for the state prison at Concord was $126,540; for the Industrial School for Committed Minors at Manchester, $91,600.

Communication.—Although highway construction was curtailed because of the war, the state had at the end of 1942 mo than 1,680 mi. of paved roads, many of six lanes. In the 25 yea of its existence, celebrated March 30, 1942, the department h expended approximately $572,000,000 in the development of elaborate system of roads, bridges, viaducts and grade crossing In 1939 there were 2,123 mi. of steam railways in New Jersey.

Apples, bu.	3,397,000	2,632,000
Tame hay, tons	383,000	342,000

Banking and Finance.—The 158 financial institutions und jurisdiction of the state department of banking and insurance r ported total assets, at the close of the state's fiscal year June 3 1942, of $1,589,811,958—a decline from the preceding Decemb (1941) figures of $2,834,833. The report was made by 108 tru companies, 25 state banks, 23 savings banks and 2 savings asso ations.

Agriculture.—Harvests in 1942 broke all previous recor surpassing the goals set for wartime production. The total acr age harvested was 793,200 ac.; crops had an estimated value $33,328,000.

Manufacturing. — Employment in New Jersey industr reached a record high in 1942. More than 800,000 were gainfu employed, according to preliminary reports to the state depa ment of labour from 1,785 plants. The figures indicated an i crease of 19% over 1941. Average weekly earnings ran to a re ord high of $43.79, and more than 5,000 plants were engaged war production.

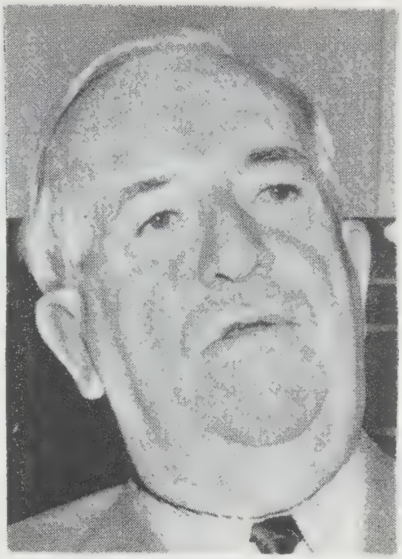
Mineral Production.—The total value of New Jersey's mi eral production in 1939—the latest year for which federal figu were available in 1942—was $30,271,293. The leading produc in order of value, were zinc, clay, sand and gravel, stone and ir ore. (W. R. Ck.)

Newkirk, John Van Kuren ("Scarsdale Jack") (191 1942), U.S. flier, was bo Oct. 15 and studied at the Rensselaer Polytechnic institute Troy, N.Y. He enlisted as a navy flier in 1938 and joined t American Volunteer group, a band of U.S. airmen who foug with Chiang Kai-shek's armies in China, in 1941. He soon w promoted to squadron leader and won the rank of ace for havi shot down 25 enemy craft in battles over the Burma road. the early part of 1942, his squadron had bagged 136 planes, a counting for 300 Japanese airmen. In March 1942, the Briti government awarded him the D.S.O. for his feats. He was sh down and killed during an A.V.G. raid over the Chieng Mai aer drome in Thailand, on March 24.

New Mexico. Fourth largest state in the southwestern Unit States, popularly known as the "Sunshi state"; admitted to the union in 1912. Total area, 121,666 sq.m pop. (1940) 531,818 (25·6% increase since 1930), divided amo rural, 355,417; urban, 176,401 (33·2%); native white, 477,06 Negro, 4,672; foreign born, 15,247.

History.—The administration, legislature and congressio representation were Democratic in 1942. The chief officers the state elected on Nov. 3, 1942, were: governor John Dempsey; lieutenant governor, James B. (Jawbone) Jon secretary of state, Cecilia Tafoya Cleveland; auditor, J. Hannah; treasurer, Guy Shepard; attorney-general, Edward Chase; superintendent of public instruction, Georgia L. Lus missioner of public ls, H. R. (Ray) Rod-. U.S. senators were A. Hatch and Dennis vez; representatives, ton P. Anderson and onio M. Fernandez.

ducation.—For the ol year 1941–42, 710 l schools, with 58,253 ils and 1,754 teach- cost $4,118,476.33; municipal schools, 73,089 pupils and 9 teachers, cost $5,- 214.28.



JOHN J. DEMPSEY, Democrat, elected governor of New Mexico Nov. 3, 1942

blic Welfare, Char-, Correction.—For fiscal year ending 30, 1942, the WPA t $10,216,935.75 for ur and material, and NYA spent $354,520.82 (1941). During calendar year 1942, $500,880.04 was paid out for unemploy-t benefits. On June 30, 1942, $168,000 had been spent for age and survivors insurance.

he penitentiary appropriation was $130,480 for 610 inmates t. 1, 1942), including 84 on the prison farm; insane asylum, ,280, 854 inmates; School for Mental Defectives, $47,480, mates; Industrial school, $39,000, 113 inmates (Nov. 1942); s' Welfare home, $47,000, 110 inmates (Dec. 1942).

ommunication.—New Mexico had an estimated 62,833 mi. oads in 1942; 9,349 constituted the state highway system. the fiscal year ending June 30, 1942, the state highway rtment expended $7,600,808.02. Steam railway companies ated 2,692 mi. of main track (1941).

here were 45 airports, and approximately 1,302 mi. of air-s operated by three scheduled air carriers in 1941. There about 45,000 telephones.

anking and Finance.—On June 30, 1942, there were 22 na-al banks with deposits of $60,058,000; loans, $18,963,000; stments, $20,927,000; and 19 state banks with deposits of 363,000; loans, $6,205,000; investments, $4,317,000. Total urces of 12 building and loan associations in 1941 were 21,129.49 and of 7 federal savings and loan associations, 60,514. Total of all state receipts for the fiscal year ending 30, 1942, were $32,230,374.91; expenditures, $32,868,697.47. gross and net debt were respectively $24,915,500 and 620,595.27.

(F. D. R.)

New South Wales.

A state of the Australian commonwealth, lying in the southeast and occupying 309,432 sq.mi.; pop. (est. Dec. 31, 1941) 2,812,321. Chief cities (pop. est. Dec. 31, 1939): Sydney, capital (1,302,890); Newcastle (117,050). Governor (1942): Captain the Rt. Hon. Lord Wakehurst.

History.—The labour administration under the premiership of William J. McKell remained in office throughout 1942. The policy of the government was to co-operate with the federal administration in all matters pertaining to the vigorous prosecution of the war. This attitude was exemplified when the federal government introduced its uniform income tax legislation in June. The first reaction in New South Wales, as in the other states, was to oppose this federal incursion on state rights. Mr. McKell announced that his government would join the other states in contesting the validity of the legislation, but after reconsideration of the position by the labour caucus, the cabinet reversed its decision.

The state budget was introduced in October and showed a surplus of £A880,000 for 1941–42. Although no new taxes were introduced for 1942–43, Mr. McKell said "Nothing will change our view that the maintenance of a certain standard in the social services is essential for the successful prosecution of the war."

The loan council's allocation of loan money expenditure for New South Wales for 1942–43 was £A3,232,000, practically all of which would be absorbed by works associated with defense needs.

Education.—In 1940: public schools, 3,209; teachers, 12,877; scholars on roll, 359,777; average attendance, 296,924; expenditure by state, £A4,882,000.

Finance.—In 1940–41: revenue, £A60,750,000; expenditure, £A61,610,000; debt outstanding (June 30, 1941), £A368,975,000.

Communication.—Roads (1939), 62,297 mi. fit for motor traffic. Railways, government (Dec. 1941), 6,127 mi. Tramways (June 1941), 172 mi. Motor vehicles licensed (March 31, 1942): cars, 174,848; commercial vehicles, 73,663; cycles, 16,031. Wireless receiving set licences (Mar. 1942), 502,810. Telephones (June 1941): exchanges, 2,018; instruments connected, 280,161.

Agriculture, Manufacturing, Mineral Production.—Production in 1941–42: wheat, 48,500,000 bu.; butter, 112,000,000 lb.; wool, greasy, 550,000,000 lb.; maize, 2,833,000 bu.; coal (1939), 11,196,000 tons; gold (1939), 87,189 fine oz. Industry and labour, 1940–41: factories, 9,919; employees (average) 264,600; gross value of output £A285,916,850; unemployment (trade union returns) (Feb. 1942) 2.0%. (W. D. MA.)

Newspapers and Magazines.

The year 1942 brought to American newspapers the full impact of war economy—shortages of materials and manpower, priorities, rationing and rising cost of news gathering—as well as several conflicts with governmental agencies. But these problems were offset by evidence that, because of newspaper war services and adequate handling of the war news, the criticism of the press that marked the previous decade almost completely disappeared.

The extent to which war dominated the news was indicated by "The Twelve Biggest News Events of 1942," as drawn up by the Associated Press, as follows: (1) a "second front" is opened Nov. 7 (Nov. 8, Algerian time) with invasion of North Africa (accompanied by Rommel's rout and scuttling of French fleet at Toulon); (2) America takes offensive in the Pacific, administering a series of disastrous defeats to Japanese (at Midway, Coral sea, Solomons, Guadalcanal); (3) Russia holds (at Stalingrad) and counterattacks; (4) Japan carves out an empire in a few short months (Philippines, Singapore, Java, Burma); (5) two-party government strengthened in U.S. with Republican comeback in Nov. 3 elections; (6) Tokyo bombed April 18; (7) America goes on wartime economy, with one cup of coffee a day epitomizing the transition; (8) six of eight nazi submarine-landed saboteurs executed Aug. 8; (9) Eddie Rickenbacker rescued; (10) Dieppe raided Aug. 19 in one of the most spectacular incidents in war; (11) bombers raid Europe with worst yet to come as American planes prove their superiority; (12) Boston Cocoanut Grove night-club fire tragedy Nov. 28. To this list, other editors added: the draft of 18–19 year old boys; mobilization of women in WAAC, WAVES, SPARS, etc.; Prime Minister Winston Churchill's visit to Washington; Wendell Willkie's round-the-world trip; unprecedented federal tax law; rise of American war production. No one could keep the list down to ten items for 1942.

The impact of America's all-out conversion of industry to war production was felt at once in the mechanical departments of all publications. Manufacture of printing machinery, such as presses and linotypes, even typewriters, was stopped at once. Shortages of rubber and of printing metals, such as aluminum, zinc, copper, nickel, brass, tin and lead, set all publishers to studying economies. Picture-printing was reduced by shortage of zinc and copper; camera film for news photographers was reduced 24%. Gasoline and tire rationing brought problems to circulation departments, including the November order of the Office of Defense Transportation to reduce truck mileage by 25% and to provide for 75% return loads. Newspapers of larger cities resorted to fewer daily editions, to pooled deliveries and even to horses and wagons—with resulting protests from deliverymen's unions.

The problem of newspaper printing paper did not become acute until near the end of the year, although the constant threat of it led to many economies, and chlorine shortage at the mills showed in grayer paper. The price of newsprint had been frozen at $50 a ton, but shortage of manpower, electric power and transportation developed in the Canadian mills which supply most of the paper used by American newspapers. In December committees from the newspapers and printing industry were in Washington conferring with the government on possible rationing, and it was expected that the 1943 supply would be reduced 20% to 25%.

Manpower shortage began early; by March the newspapers had contributed 7,000 men to the armed forces and by December the number had increased manyfold. In September the army ruled that "key men" in certain occupations, including newspapers, could not enlist or volunteer for commissions without the consent of employers and ordered local draft boards to defer essential men. The chief sufferers in the manpower shortage were weekly newspapers and small print shops, of which perhaps 10,000 out of 43,000 closed because they could not obtain printers. Meanwhile, women were invading the news staffs and publishing plants as never before since World War I, and newspapers were begging the schools of journalism for help and urging "accelera programs" and similar devices to provide more graduates fas

RESEMBLING THE "OLD BILL" of Bruce Bairnsfather's cartoons, this correspondent worked, slept and ate in his slit trench behind the British lin El Alamein, Egypt, in the summer of 1942

Despite shortages, newspaper circulations went to all-time hi increasing even faster than in 1941. Tabulations near the enc the year showed daily circulations up 2.3% (2.91% for morr papers and 1.87% for afternoon papers) and Sunday papers 7.15%. In some cases the increase reached 17%. The 11 ma newspapers of New York city gained an average of nearly 400, reaching the daily total of 10,901,513 copies. The increase in spite of a widespread rise in prices to 4 or 5 cents a copy; March 806 small city dailies were selling for 5 cents, and December 648 dailies reported a price rise during the year. M to the surprise of many prophets, newspaper advertising did decline materially although it changed in character. The doct that "it pays to advertise to keep the firm name alive for post-war market" was widespread, and, when there were no gc to sell, the merchant or manufacturer bought space to ad "wise buying" and conservation of available goods.

Besides spending millions to gather the news of a war spr all over the globe, American newspapers extended their " service" to devoting thousands of columns of space to var civilian war drives, such as civilian defense, air-raid precauti sales of war bonds and stamps, rules of rationing and price trol. Outstanding among these was the national scrap drive. A the *Omaha World-Herald* had led a drive that collected 60 tons of scrap in Nebraska in three weeks, the War Produc board called 16 newspaper leaders to Washington in Septem and asked them to try to collect 4,000,000 tons throughout country. By November 5,364,415 tons had been gathered, but newspapers had devoted some 280,000 columns of free spac the job. Second in interest was a campaign through which 300 carrier boys, under the direction of newspaper circulation dep ments, sold 547,188,878 10-cent war savings stamps. Am smaller newspapers, a common service was to send free subsc tions to all local men in military service. Among metropol newspapers, appeared the sharing of exclusive news beats of t own foreign correspondents; in June the *Chicago Tribune* g its exclusive Stanley Johnston story of the Coral sea battle tc three press associations, and in July the *Chicago Times* did same with the exclusive Alaska stories by Keith Wheeler.

The system of voluntary censorship set up under the direc of Byron Price in Dec. 1941 continued to work satisfactorily, cept for some grumbling over censorship by the army and na and over the censorship of all news of President Roosevelt's about the country in September. The reorganization in July e Office of War Information under Elmer Davis was welcomed, cause of the clear definition of the three branches: domestic erations; propaganda broadcasts to Europe; and protection of ilian morale against axis propaganda. Both press and radio coerated with Mr. Davis and Mr. Price throughout 1942. The *icago Tribune* executives were summoned before a federal nd jury in August on the charge that Correspondent Stanley nston had divulged confidential navy information in his June 7 icles on the battle of Midway Island, but no indictment was urned. A small flurry developed in December over an order of OWI subordinate to the *Los Angeles Times* concerning the e of a news headline, but the order was quickly disavowed.

The most discussed conflict between the newspapers and the vernment was an antitrust suit instituted by the federal dertment of justice, charging the Associated Press with being a nopoly and citing the protest of the *Chicago Tribune* against P. membership for the new *Chicago Sun* founded late in 1941 Marshall Field. After hints of such a suit early in the year, A.P. on April 20 revised its by-laws to revoke the famous ht of protest and to liberalize membership admission; but at same meeting the A.P. members voted 684 to 287 against nitting the *Sun*—also voting down membership for Eleanor dill Patterson's *Washington Times*. The justice department d the suit on Aug. 28, and the A.P., responding on Oct. 27, tested that the suit would create a monopoly by destroying its npetitors, the United Press and the International News Serv, and would convert the A.P. into "a public utility" to be regted by government. On Oct. 29 the *Chicago Tribune* filed a arate answer, and later some 1,000 smaller newspaper members anized to file a third answer. The suit was still pending at the l of the year. Another conflict developed over hearings started e in 1941 by the Federal Communications commission, to inre into the extensive control of radio stations by newspapers; se were ended by a court decision on Jan. 26, 1942. During y smaller newspapers were concerned over discussion in conss threatening the newspaper second-class postal rate, but the tter was shortly dropped.

Although few newspaper strikes occurred during 1942, New rk city was disturbed in December by a strike of the Newsper Deliverers union which tied up 12 major newspapers for ee days. The Newspaper guild, holding its ninth annual contion at Denver, deferred all major squabbles. On May 1 the *w York Times* signed its first contract with the guild; in Nonber the *Aliquippa* (Pa.) *Gazette*, long closed by a strike, was refinanced by the striking guild; the Los Angeles guild in November took the novel action of admitting 500 newsboys to membership.

RESS CLUB" of U.S. newspapermen on Guadalcanal in the Solomon Islands 1942

Because of the world-wide scope of the war, with newspaper men joining fighting men on fleets, bombers, submarines and tanks, the tale of the war correspondent developed into an epic known in no other war. Up to December the casualty list of American war correspondents was tabulated as follows: 10 killed; 33 wounded; 2 missing; 65 captured, of whom 23 were still in custody. Outstanding were the adventures of 26 newspaper people returned on Aug. 25 on the "Gripsholm" from Japanese custody in the orient, several, like J. B. Powell of Shanghai, crippled for life. Almost every week brought such thrilling stories as those of Larry Allen, A.P. correspondent captured on Sept. 13 by the nazis after a British naval raid on Tobruk, and Vern Haugland, A.P. man, rescued on Sept. 19 after parachuting from a bomber and wandering in the New Guinea jungle for 47 days. For those returning home for rest, public lecture tours became a bonanza, paying newspaper speakers from $100 to $2,500 per talk. Other thrills were promised for the newspaper men enlisted as "combat reporters" in the marine corps and in various public relations activities in the army and navy.

Changes among the large newspapers were: the *New York Post* became a tabloid on April 6 and dropped Franklin P. Adams' famous column, "Conning Tower," in August; the *New York Times* merged its rotogravure and magazine sections in January, after having sold its Wide World Photo service to the Associated Press; the A.P. membership of the suspended *Philadelphia Public Ledger* was sold to the *Inquirer* for $10,000 in January; Marshall Field became sole owner of New York *PM* in January and his editor, Ralph Ingersoll, was inducted into the army in July; Walter Winchell disappeared from the radio and the *New York Mirror* in December when as an officer in the navy he was sent to Brazil; Charles Michelson, publicity man of the Democratic national committee since 1930, retired in December. Notable suspensions were: the *Milwaukee Post*, successor of Victor Berger's socialist *Leader*, on May 23; and the *Kansas City Journal* on March 31.

American magazines and periodicals were even more seriously affected by war economy than were the newspapers; declining advertising reduced their size; paper shortage was evident in the substitute stocks used; contents of the large newsstand magazines were devoted more and more to articles and fiction concerning the war, some magazine war correspondents sharing the glory with newspaper and radio daredevils. By concerted action, 500 magazines appeared with the American flag in colours on the covers of their July issues; much of the reading public commented on the striking change in format and title of the *Saturday Evening Post*. An ugly scandal resulted from the conviction on Sept. 5 of the former publisher of the *North American Review*, the *Living Age* and *Current History* on the charge of serving the Japanese government for pay for three years; he had later organized *Scribner's Commentator* which was suspended for subversive behaviour. *Social Justice*, mouthpiece of the Rev. Charles Coughlin, was barred from the mail in April. Two interesting new projects were: the *Far Easterner*, launched in December by J. R. Young, former I.N.S. writer in Japan, and J. B. Powell, former editor of the Shanghai *China Weekly Review;* and *Victory*, a pictorial in several languages, to be published every other month for foreign circulation by the Office of War Information. Two others, forced to suspend because of paper shortage, were *Extra*, a midweek pictorial launched in New York, and *Parade's Weekly*, a 5-cent companion of his *Parade* newspaper supplement, launched by Marshall Field in May. (G. M. Hy.)

Great Britain.—Notwithstanding the shortage of many vital materials and increased staffing difficulties caused by the recruitment of man-power for the forces, the newspaper and periodical industry of Great Britain during 1942 continued to prosper. It was felt by the cabinet that newspapers and periodicals were part of the front line effort in the maintenance of public morale by the dissemination of war information. Hence, the government extended facilities to newspaper and magazine representatives to watch the war effort from all angles and to write with comparative freedom. At no period since Sept. 1939 was there greater liaison between the authorities and the general public than that provided by the daily, weekly and monthly press. The national newspapers spent large sums in reporting the war all over the world, and cabled accounts from the far and middle east, from Iceland and the United States, from Russia and Madagascar, were in the highest tradition of British journalism. The permanent staff of the national papers numbered 12,000, as against 18,000 pre-war, excluding the canvassing staff of several thousands disbanded immediately upon the outbreak of war.

The consumption of newsprint by the national newspapers was approximately 210,000 tons per annum, compared with more than 600,000 tons just before the war. The periodical press consumed in 1942 newsprint at the rate of 40,000 tons per annum in contrast with 200,000 tons pre-war. In March a 10% cut in newsprint was met by the popular national papers cutting their circulation.

The net profits of many of the newspaper and periodical publishers exceeded the previous year. The following figures give the profits shown in the 1942 balance sheet as compared with those (in parentheses) for 1941: London Express Newspapers (after providing £565,000 for taxation), £247,789 (£246,185); Amalgamated Press, £750,162 (£593,555); George Newnes, £120,387 (£120,084); News of the World, £631,285 (£501,685); Sunday Pictorial Newspapers, £192,497 (£208,709); Allied Newspapers, £465,689 (£481,775); Daily Mirror, £302,307 (£288,835).

Circulations were maintained at a high level but readers of the *Times* and *Telegraph* were asked to share their copies. The *Daily Express* net sale in September, certified at 2,541,708 copies daily, was claimed to be three-quarters of a million more than any other daily in Great Britain.

In spite of the newsprint shortage over 80 foreign papers were regularly published in 1942: dailies, weeklies and monthlies. These expressed the views and printed the news of the oppressed nations under the control of the axis powers such as France, Denmark, Holland, Belgium, Greece, Norway and Poland; while other publications printed news and the views of Soviet Russia and refugee Germans.

A large number of foreign journalists were engaged on these papers.

One of the notable events of the year was the reappearance on Sept. 7 of the communist *Daily Worker* which was banned in Jan. 1940, when the home secretary ruled that its stock contents were calculated to foment opposition to the successful prosecution of the war. The lifting of the ban was acclaimed by the whole press.

In March the home secretary, Herbert Morrison, warned the *Daily Mirror* under Defence Regulation 2D because of a cartoon by "Zec."

The warning aroused much controversy in all circles, and when the subject was debated in parliament the traditional freedom of the press was widely supported.

Three important changes occurred in Fleet street during 1942. In February J. L. Garvin retired from the *Observer* on a difference of policy after 34 years' editorial control, and later joined the *Sunday Express* where he continued his weekly article which had made him famous for a generation. Michael Foot succeeded to the editorship of the *Evening Standard* when Frank Ow joined the forces, and the Hon. Lionel Berry, eldest son of Lo Kemsley, became the editor of the *Daily Sketch*.

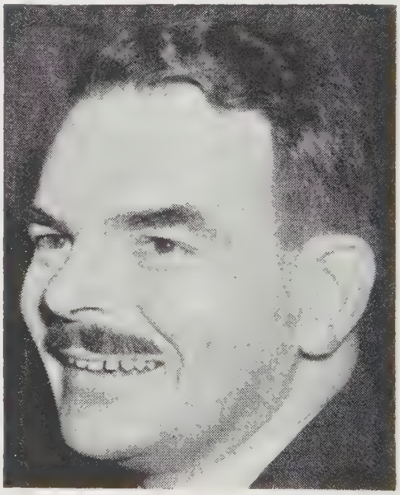
In November the *Observer* decided to print news on the fro page, and the *Times* then remained the only national newspap to retain the front page advertisement tradition. (*See* also A VERTISING; PRINTING.)

(S. R. C.)

New York.

One of the original 13 states of the union, pop larly known as the "Empire state," New Yo covers an area of 49,576 sq.mi., of which 1,647 sq.mi. are wat With a population of 13,479,142 (federal census, 1940) it retain its place as the most populous of the states. It had in that ye a foreign-born population of 2,853,530, which included 584,0 born in Italy and 316,800 born in Germany. The capital is A bany, with a pop. of 130,577. Among the other cities are N York, with a population of 7,454,995, or about twice as many any other city in the U.S.; Buffalo, 575,901; Rochester, 324,97 Syracuse, 205,967; Yonkers, 142,598; Utica, 100,518; Bingha ton, 78,309; Troy, 70,304.

History.—The legislature at its 1942 session created a sta war council with broad powers, authorized the waiving of the ru of a 40-hour week on public work and the maximum number hours a day for employment on private work, permitted the e ployment of prison labour in the production of goods needed f war, reduced the state income tax by 25% for 1942 and 194 abolished the only remaining state tax on real estate, gave t welfare commissioners the right to refuse home relief to perso who refused to accept work and passed a congressional reappo tionment act continui the practice of electi 43 of the 45 represent tives by districts and tw at large. It rearrang the boundaries of t congressional districts become effective in 194 It also authorized t construction of a sup highway on new rights way on the west bank the Hudson river fro the New Jersey state li to Albany and then across the state to Buffa and along the shore Lake Erie to the Pen sylvania state line.



THOMAS E. DEWEY, governor of New York, elected Nov. 3, 1942, in a Republican vote of landslide proportions

As the state was to ele a governor, Preside Roosevelt sought to induce the Democrats to nominate Unit States Senator Mead, but he was opposed by James A. Farle chairman of the Democratic state committee, who favoured Jo J. Bennett, Jr., the attorney general. He succeeded in bringi about the nomination of Bennett. The Republicans nominat Thomas E. Dewey, who had distinguished himself as district torney of New York county, and the American Labor party nam Dean Alfange. Dewey was elected by a plurality of more than h a million votes, the first Republican to be elected to the office in years. The Republicans also elected the lieutenant governor and t state controller, while the Democrats elected the attorney gener Three supreme court judges were re-elected in the first distr with the support of either the Republicans and Democrats or t Democrats and the American Labor party. In the second distr five judges were elected with the support of the Republicans a ocrats.

November 22, President Roosevelt appointed Governor nan as director of foreign relief and rehabilitation to act un- he supervision of the state department. The governor, who inherited a deficit of $100,000,000 from F. D. Roosevelt, his ecessor, and left office with a surplus of $70,000,000, resigned)ecember 3 to take up his new duties and was succeeded by les Poletti, the lieutenant governor, who served until Jan. 1,

le principal officers in 1942 were Herbert H. Lehman, gov- , Charles Poletti, lieutenant governor, who became governor ecember 3, John J. Bennett, Jr., attorney general, Arthur W. dt, superintendent of public works, and George D. Stoddard, nissioner of education.

ucation.—During the fiscal year ending June 30, 1942, the year for which complete figures have been assembled, there 972 high schools with 741,596 pupils and 8,357 elementary ols with 1,427,161 pupils. The total cost of maintaining the ols, exclusive of money raised by the sale of bonds was $357,- 85.

blic Welfare, Charities and Correction.—The number of ns receiving public assistance in Oct. 1942, was 278,011, as ared with 344,458 in 1941 and 492,040 in 1940. The amount for relief during the month was $9,784,200 or $2,000,000 han in 1941 and $4,000,000 less than in 1940. Old age assist- was given to 117,214 persons to the amount of $3,287,349 ne month; $82,623 was paid out for the relief of 2,815 blind, 2,430 dependent children and their families received $1,368,-

e number receiving WPA assistance for the month was 3 as compared with 82,261 in Oct. 1941. There were 14 in- ions under supervision of the department of correction with erage population of 17,564 for the fiscal year 1941–2. The of maintenance and personal service was $10,380,963.10.

mmunication.—There were in the state 84,591 miles of vays in 1942 exclusive of the streets in cities and incorpo- villages, of which 71,836 were town and county roads. Of otal, 58,620 miles were classified as improved. The state ap- iation for their maintenance, exclusive of money for grade ings, was $6,800,000, and $7,037,645 was received from the al government for highway purposes. The state maintained stem of canals 515 mi. long, including the Erie, Oswego, ga-Seneca and Champlain. The Erie, which runs from Water- on the Hudson to Tonawanda on Lake Erie, is 339 mi. long. ng the operation season of 1941, 4,503,059 tons were carried ne canals, and for the fiscal year $43,158,079.05 was appro- ed for maintenance, operation and personal services. Al- gh no tolls are charged, the canals yielded a revenue of $666,- rom the use of terminals, sale of water power, licenses and peration of grain elevators.

nking and Finance.—On Dec. 31, 1941, there were 1,282 cial institutions under the supervision of the banking depart- , including 126 state banks, 156 trust companies, 14 indus- banks, 134 savings banks and 194 savings and loan associa- . The total deposits in all the institutions were $19,222,316,- . In addition to the institutions under the supervision of the ing department there were on June 30, 1942, 419 national s with a total capital of $273,551,000, deposits of $8,364,- 00 and assets of $9,331,061,000. Twenty-six foreign banking rations maintained offices in the state in charge of their s.

riculture.—According to the census of 1940, there were 38 farms in the state with a total acreage of 17,170,337. The of the products sold, for 1939, was $273,175,053 of which 052,240 consisted of livestock and livestock products.

Table I.—*Leading Agricultural Products of New York, 1942 and 1941*

Crop	1942	1941
Corn, bu.	28,120,000	26,169,000
Tobacco, lb.	1,500,000	1,750,000
Potatoes, bu.	27,313,000	28,078,000
Apples, bu.	17,500,000	16,120,000
Grapes, tons	69,600,000	56,800,000

Manufacturing.—In 1939, according to the manufacturing census, there were 34,506 manufacturing establishments employing 957,844 persons, paying $1,163,785,198 in wages and producing goods valued at $7,134,400,147.

Table II.—*Principal Industries of New York, 1939 and 1937*

Industry	Value of products	
	1939	1937
Boots and shoes	$101,141,500	$125,819,448
Bread and bakery products	204,500,887	243,386,287
All clothing	917,562,506	842,556,856
Steel products	197,884,816	157,809,733
Printing, including periodicals	416,760,806	576,731,299

Mineral Production.—The total value of raw minerals produced in 1939 was $78,383,851.

Table III.—*Principal Mineral Products of New York, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Cement	$ 9,866,102	$ 7,893,270
Coke	24,526,646	23,529,138
Ferroalloys	18,388,766	7,699,520
Petroleum	10,650,000	9,550,000
Pig iron	45,275,716	25,450,764
Salt	5,855,422	5,467,077
Stone	10,111,032	10,527,452

(G. W. Do.)

New York City.

The largest city in the U.S.A., New York had a population of 7,454,995, according to the census of 1940. Mayor: Fiorello H. La Guardia.

A crusade against gambling was begun early in 1942. John Harlan Amen, a special prosecutor appointed to conduct an investigation in Brooklyn, charged the police in that borough with receiving $1,000,000 a year for the protection of gambling house operators, and he named 34 of them whom he accused of guilt. They were arraigned before the police commissioner, who dismissed five from the force, reprimanded three, found two innocent and inflicted some form of punishment on the others. Mayor La Guardia in the autumn asked all those who knew of the location of gambling houses to let him know. As a result, citizens sent him a list of 244 gambling houses. The list was sent to the various police precinct commanders with instructions to close the places.

Complaints against indecent shows on Broadway led to an order closing the play, "Wine, Women and Song," in which there was a disrobing scene. This action was precipitated by a sermon by the Roman Catholic archbishop in which he denounced indecency in the theatre without advertising any shows by naming them. It was announced that other shows of a similar character would be closed.

The substitution of bus lines for elevated railroad lines progressed. The removal of the structure of the Second avenue line was assured when the state legislature in the spring of 1942 passed a bill authorizing the apportionment of the cost, one-third upon the borough of Manhattan, one-third upon the real estate to be benefitted and one-third on the city. Placing one-third of the cost upon Manhattan was justified as the removal would take from the centre of a wide thoroughfare an unsightly obstruction and increase the taxable value of the property along the street. The removal of the Ninth avenue structure was assured when an agreement was reached to levy one-third of the cost on the real estate benefitted and the remainder on the city.

When the federal government at the beginning of the war took over the free port zone, established on Staten Island in 1938, the legislature authorized the transfer of the business of the zone to Manhattan for the duration of the war so that it might still serve the importers.

Work on the construction of a tunnel under the harbour from the Battery in Manhattan to Brooklyn was suspended by order of the War Production Board to release a large number of workers as well as to reduce the demand for iron. The Tunnel Authority had 28,000 tons of cast iron lining which the officials in charge planned to sell for scrap.

The local housing authority tore down the houses on a 38 acre plot near Fort Greene Park in Brooklyn and erected on it a large group of apartments for workers in the navy yard as well as for those families who had been forced to vacate their homes to make room for the new buildings. They were planned to accommodate 13,100 persons in modern, sanitary quarters at a modest rent, and were opened for occupancy in December. (*See* also Municipal Government.) (G. W. Do.)

New York University. An institution of higher education at New York city. Twenty thousand of this institution's alumni and former students were in war service in 1942, and 10,000 students were enrolled in war training courses. Two hundred fifty faculty members had joined the armed forces and related agencies. Special students attending government-sponsored war training courses numbered 5,500. For other statistics of the university, *see* Universities and Colleges.

New York university was one of five centres in the metropolitan area for advanced work in meteorology; some 400 officers of various war forces were receiving such training in 1942. Other assigned contingents were receiving ordnance training, special instruction in aeronautical engineering, in electronics and in other fields. A national training conference on aerial bombardment protection and another on munitions plants safety education were conducted. Studies in industrial camouflage were well patronized. Every possible element of the diversified curricula of the 13 schools and colleges was given a wartime bent and application. General physical fitness was stressed in the curtailment of intercollegiate sports and emphasis on corrective exercise and intramural athletics.

The Bellevue Schools of Nursing, with 450 women and men students and 50 teachers, were adopted as an integral division of the university's college of medicine, while an extended post-graduate program in nursing was instituted for the U.S. public health service.

Degrees and certificates were conferred upon 4,412 graduates. (H. W. Ch.)

New Zealand, Dominion of. A British dominion, consisting of a group of islands lying in the south Pacific between 34° 25′ and 47° 17′ S. and between 166° 26′ and 178° 36′ E. Area: Dominion proper, 103,415 sq.mi.; other islands, 519 sq.mi.; pop.: Dominion proper, (est. Dec. 31, 1941) 1,631,414, including Maoris (93,116): Cook and other Pacific islands (census 1936), 16,350. Chief cities (pop. est. April 1, 1941): Auckland (223,700); Wellington (cap. 160,500); Christchurch (135,500); Dunedin (82,200). Language: English. Religion: Christian (1936 figures, excluding Maoris: Church of England 600,786; Presbyterian 367,855; Roman Catholic 195,261; Methodist 121,012). Ruler: King George VI; governor general (1942): Air Marshal Sir Cyril Newall, O.M.

History.—While New Zealand forces in 1941 had received a bitter baptism of fire in Greece and Crete, it was not until the Japanese struck in December of that year that the dominion itself
was directly menaced. The prime minister, Peter Fraser, at on
declared that all civilians must be placed on a war footing, a
the country's history in 1942 was largely the story of the ste
taken to implement this declaration. Whereas in Sept. 194
65,000 men were on active service, the number rose by May 19
to 140,000 (compared with 120,000 in World War I). Relatio
with the United States became of vital importance and the a
pointment in January of Walter Nash as minister in Washingt
proved a great success. Nash visited Britain later in the year a
conferred with the war cabinet. Brigadier General P. J. Hurle
U.S. minister to New Zealand, arrived on March 12. With t
whole country on a war footing, opinion in favour of a natio
government grew, especially since it was well known that t
prime minister was held back from this step only by the oppo
tion of the trade unions, which feared its effect upon the wh
system of social security built up by the Labour governme
Finally, as a compromise, an administration charged with all ma
ters relating to the war effort was set up, with its own war ca
net. This war administration was to function side by side wi
the Labour government cabinet, which continued to handle
matters of policy and administration not connected with the w
The war administration comprised seven Labour members and
opposition members, and its cabinet of seven was made up of fo
Labour representatives, including as well as Mr. Nash, Mr. Fras
the prime minister, D. G. Sullivan (supply and munitions),
Jones (minister of defense), and three opposition members, J.
Coates (armed forces and war co-ordination), A. Hamilton (as
ciate minister of supply and munitions), and S. G. Holland (w
expenditure and deputy chairman). This somewhat curious co
promise appeared to be working reasonably effectively until
was terminated by the resignation of four opposition membe
who disagreed with the manner in which a Waikato coal stri
was settled.

War costs in New Zealand currency were estimated at £13
000,000, as against £53,000,000 in the previous year, and we
substantially more than the whole cost of World War I to the d
minion. The prime minister said existing war taxes would pr
duce £20,000,000, miscellaneous surpluses and revenue £7,000,0
borrowing from the United Kingdom under agreement £46,00
000, lend-lease procedure £10,000,000, leaving £50,000,000 to
met by new taxation and loans. Of this, £14,400,000 would
found by taxation, including increase of income super-tax fr
15% to 33⅓%, social security tax raised from 1/- to 1/6d. in t
pound on all income, and substantial additions to sales, liqu
and tobacco taxes. National saving and departmental investme
were estimated to produce £8,000,000 and £27,600,000 would
raised by war loans at 2½% and 3%. Expenditure on natio
development from loans would be reduced from £12,000,000
£4,500,000. The direct taxation rate was now 18/- in the pou
at £2,500 unearned and £3,700 earned income. For compan
the maximum rise was to 14/- in the pound, compared with 12
previously. To assist the family man an additional bonus of 2
per child on the existing family allowance was provided for.

The announcement in February that the combined naval for
in the Australia-New Zealand area were being established un
an American commander and of the establishment of the Pac
war council at Washington were both welcomed. A few years
fore, the possibility that a force other than the British na
would be protecting New Zealand would have been, it was point
out, "beyond imagining," but the new situation was evidence
mutual trust and full collaboration between the dominion and t
United States. D. G. Sullivan, J. G. Coates and service rep
sentatives visited Australia in March to confer on mutual d
fense problems. A Defence Construction council was establis
to insure priority for defense works, and hours of labour on su

RICK J. HURLEY, U.S. minister to New Zealand, laying a wreath at the of a cenotaph in Auckland during Anzac day ceremonies in 1942

ks were extended. Many industries were proclaimed essential their workers reserved from military service. A great drive increased farm production achieved much success; cheese ex- ts to Britain were increased to twice the pre-war rate. Two -awaited railway links, Westport-Reefton and Gisborne- pier, were completed during the year.

ationing of sugar, tea and clothes and restrictions on the sale iquor were imposed, The number of women in factories rose 2,000 (against 11,000 in World War I). A liberty loan of ,000,000 closed with subscriptions exceeding £17,000,000, the est sum ever raised by an internal loan. A second loan was ched in October. Two rather severe earthquakes centred in Wellington province caused considerable damage to property no loss of life.

he New Zealand expeditionary force, resting in Syria after nuous exertions, was rushed back to the fighting line to play rominent part in halting Rommel's march on Alexandria. Ser- nt Keith Elliott won New Zealand's fifth V.C. of World War y a series of remarkable exploits at Ruweisat on July 15.

lucation.—(Dec. 1940) state elementary schools, 2,230; scholars, 245,- secondary, 197; scholars 52,656. University of New Zealand has six tituent colleges, including two agricultural colleges at Lincoln and nerston North, grouped together as the New Zealand School of Agricul- ; university students 5,528. Total cost (year to March 31, 1941), 55,393.

nance.—Revenue, consolidated fund, year to March 31, 1941, £40,437,- expenditure £38,711,503. War expenses account 9 mos. to Dec. 1940, 448,867; 9 mos. to Dec. 1941, £35,876,621. Public debt (March 31,) £349,427,575; note circulation May 26, 1941, £21,782,022; reserve Reserve bank) Nov. 24, 1941: gold £2,801,875, sterling £11,044,531. overseas funds, Feb. 23, 1942, £31,595,442. Exchange rate: £NZ.125= sterling=approx. $403 U.S. in 1942. Deposits in post office and trustee ngs banks (March 31, 1942) £87,575,330; depositors 1,325,312.

ade and Communication.—Overseas trade: total merchandise—exports ended April 1942, £67,520,712 (compared with £68,318,425 in 1941); merchandise imports year ended April 1942 £49,968,229 (compared £47,713,255 in 1941). Communications and transport: roads, March 1941—paved or surfaced (including main highways, 12,381 mi.) 44,271 not paved or surfaced, 9,108 mi.; railways 3,400 mi.; passenger jour- , year to March 31, 1941, 26,276,923 (compared with 24,454,014); s traffic 8,426,182 tons (compared with 7,673,950). Shipping (1940) red 2,801,685 tons net, cleared 2,824,167 tons net. Motor vehicles sed (March 1942): cars 207,353; trucks 46,983, buses 785, motor- es 16,098. Wireless licences, March 31, 1942, 372,219; telephone sub- ers, 228,346.

griculture.—(1940–41) Acreages: wheat, for threshing, 243,197, total, 733; oats, for threshing, 71,758, total, 306,944; barley, for threshing, 25, total, 41,088; maize, for threshing, 10,763, total, 16,896; linseed 4; peas, for threshing, 34,893; potatoes 16,998; onions 903; perennial grass 62,590; linen flax 13,118; western wolths and Italian rye-grass 34; cocksfoot 9,977; tobacco 2,150. Yields, total and per acre: wheat 5,865 bu. (34.15); oats 3,114,946 bu. (43.41); barley 1,066,408 bu. 30); maize 513,554 bu. (47.71); peas 741,535 bu. (21.25); potatoes 23 tons (5.54); onions 8,223 tons (9.11); perennial rye-grass 20,395,849 lb. (326). Dairy produce (1939–40): butter 3,103,797 cwt.; cheese 2,033,506 cwt. Livestock in dominion, 1941: horses 266,066; cattle 4,575,873 (including 1,779,603 dairy cows in milk and dry); pigs 769,180 (including 100,378 breeding-sows); sheep 31,751,660 (including 20,030,933 breeding ewes).

Manufacturing.—Factory production, 1940–41:—number of establishments 6,395; total number of employees 113,999; salaries and wages paid £26,946,799; value of products £147,153,559; value of land, buildings, machinery and plant £83,755,137. (A. J. Hp.)

NHA: *see* National Housing Agency.

Nicaragua.

The largest Central American republic; area, 49,500 sq.mi. Pop. (est. 1942): 1,380,000. Capital, Managua (117,000). Other leading cities: León (60,000); Granada (20,000); Masaya (14,000); Chinandega (13,000); Matagalpa (10,000). Language: Spanish. President in 1942: General Anastasio Somoza.

History.—Internal affairs in Nicaragua remained relatively quiet in 1942. The Somoza administration continued its policy of active co-operation in inter-American defense, started by declaration of war in 1941. The most significant development was the negotiation of agreements in April between the United States and Nicaragua by which the two republics were to rush construction of the Nicaraguan portion of the Inter-American highway. The United States agreed to assume two-thirds of the cost, Nicaragua the remainder.

Other items concerned in the exchange of notes were an extension of credit not to exceed $500,000 by the Export-Import Bank of Washington, an assurance by the United States that Nicaragua would be given consideration in priorities for essential supplies, and a plan to rush construction of an Atlantic-Pacific road which would be of value in hemisphere defense. Production of strategic materials was stimulated by grant of an option to the Rubber Reserve company on all crude rubber produced, and by agreements to make plantings of both rubber and abacá.

With the rest of Central America, Nicaragua found it necessary to ration tires, automobiles and gasoline, and to establish price controls.

Education.—Nicaragua in 1942 had some 700 elementary schools and 18 secondary schools. The national university is at Managua.

Defense.—The normal 2,500 men of the National Guard was increased in 1942 beyond 3,000 for the war period.

Finance.—The monetary unit is the córdoba, fixed at 20 cents U.S. The budget for 1941 (34,000,000 córdobas) was reported reduced by $600,000 in 1942.

Trade.—Trade with the U.S. for the first half of 1941 amounted to: imports, $3,316,000 (up 16% from 1940); exports, $1,888,000 (a decrease of 14.5%). Total imports for 1940 were $7,052,000; exports, $9,494,000. Gold was the most important item of export (60%). Coffee (31% in 1939), bananas (7.8%), and cotton (3%) are agricultural exports, with corn, sugar and some other crops raised for domestic consumption. Imports are textiles, machinery, chemicals, paper and books, gasoline, and some foodstuffs.

Communication.—External communication by water was curtailed by the war; air service increased in 1942. Nicaragua had 395 mi. of railroad in 1942, and some 2,000 mi. of highway, only part of which was improved.

Bibliography.—Dana G. Munro, *The Five Republics of Central America* (1918); Chester Lloyd Jones, *The Caribbean Since 1900* (1936); C. D. Kepner, *Social Aspects of the Banana Industry* (1936); Isaac Joslin Cox, *Nicaragua and the United States* (1927); Henry L. Stimson, *American Policy in Nicaragua* (1927).

Nickel.

Data on the world's nickel industry were so shrouded in secrecy because of their military value to the enemy that no specific information was published on production after the beginning of the war. It was officially announced that the Canadian output, which supplied about 90% of the total, increased materially in both 1940 and 1941. As nearly as could be judged from sales receipts of the operating companies, the increase in 1940 was something like 5%, and in 1941 more like 10%. If we accept these rough indications as a measure of world output, we arrive at estimates of 124,000 metric tons for 1940, and 136,000 tons for 1941, against 118,000 tons in 1939.

The only production in the United States is a few hundred tons as a by-product in the refining of copper, and even secondary recovery has been comparatively small—5,315 short tons in 1941. Imports were expanding rapidly, the gross weight of nickel products imported, less exports, having increased from 53,200 short tons in 1939 to 82,300 tons in 1940, and figures for the first nine months of 1941 were at the rate of 120,300 tons for the year, with the supply inadequate to meet the demand.

Operations on minor deposits in Brazil were being increased, and development work was being done on a deposit in Cuba. After the fall of France, New Caledonian matte was shipped to the United States for treatment. Nothing was heard from operations in Norway and Finland. (G. A. Ro.)

Nimitz, Chester William

(1885–), U.S. naval officer, was born Feb. 24 in Fredericksburg, Tex., and was graduated from Annapolis in 1905. An experienced submarine officer, during World War I he was chief of staff to the commander of the Atlantic fleet's submarine force. He was promoted to rear admiral, June 23, 1938. On Dec. 17, 1941 the navy high command was overhauled after the surprise attack on Hawaii, and Admiral Nimitz was made commander-in-chief of the Pacific fleet, with the rank of admiral. He assumed his post at Pearl Harbor on Dec. 31, 1941.

On Dec. 7, 1942—the first anniversary of Pearl Harbor—he predicted that the Pacific fleet would soon carry the war to Japan's home waters, but warned against underestimating the Japanese who, he said, would "fight to the last gasp. That's why it will take so long to win."

Nitrogen, Chemical.

Sodium nitrate of mineral origin was the world's first source of chemical nitrogen; later this was supplemented by ammonia recovered in the coking of coal in by-product coking ovens; and finally in 1906 the fixation of nitrogen from the air began its commercial development. According to the latest data available, now (Jan. 1, 1943) five years old but dating only a short time before the beginning of World War II, sodium nitrate furnished only 8% of the current world supply of combined nitrogen, coal by-products 27% and air nitrogen 65%, of which 11% came from the cyanamid process and 55% from the various electrical fixation processes. These figures illustrate the speed with which air nitrogen took over a predominating share of the nitrogen industry.

War demand intensified the demand for chemical nitrogen, and all three sources responded to the stimulus. World data were no longer available, but so far as they were at hand at the close of 1942, United States figures will be used to indicate the general trend. Of the three, sodium nitrate showed the least change, but this was due solely to the long haul, with the limited cargo space available more needed for other products. Between 1937 and 1941 the output of nitrogen in coal by-products increased 25% to a total of about 180,000 short tons of contained nitrogen, and was still growing. No specific figures could be located for the air nitrogen branch of the industry, but it was known to have b
expanded to an enormous degree, and current or planned capac
was probably several times that of 1938. Just what the t
capacity of these three sources was at the close of 1942, could
be known, but whatever it might be, that it was not sufficient
evidenced by the listing by the War Production board of a
monia, cyanamid, nitric acid and sodium nitrate among th
materials the supply of which was inadequate to meet curr
demand. (G. A. Ro.

North Carolina.

A south Atlantic coast state, popula
known as the "Old North state" or
"Tar Heel state," North Carolina is one of the original 13 sta
of the union; area 52,712 sq.mi.; pop. (1940), 3,571,623, of wh
974,175 (27·3%) were urban, 2,597,448 (72·7%) rural and 1,0
501 (28.2%) nonwhite. Capital, Raleigh (46,897); other cit
Charlotte (100,899); Winston-Salem (79,815); Durham (
195); Greensboro (59,319); Asheville (51,310).

History.—In the June Democratic primary Josiah Will
Bailey won the nomination for United States senator
Richard T. Fountain and was re-elected easily in November
his Republican opponent. In the November election, in wh
the vote was small, the Democrats won every judgeship, ele
all 12 congressmen, including former governor and United St
senator Cameron Morrison from the new district, and captu
overwhelming though somewhat reduced majorities of both hou
of the legislature. The voters also ratified two constitutio
amendments providing for solicitorial districts which need
be the same as the judicial districts, and for the centraliza
of control of the public schools in one state board of educat

State officers in 1942 were: J. Melville Broughton, goverr
R. L. Harris, lieutenant governor; Thad Eure, secretary of st
George Ross Pou, auditor; C. M. Johnson, treasurer; Clyde
Erwin, superintendent of public instruction; Harry McMul
attorney general; W. P. Stacy, chief justice.

Education.—In 1940–41 there were 3,769 public elemen
schools with 18,470 teachers and 680,268 pupils and 982 pu
high schools with 7,530 teachers and 207,880 pupils, operate

t of $34,195,798, about four-fifths of which was contributed ie state government.

blic Welfare, Charities, Correction.—In Dec. 1942 public s amounting to $407,052 were made to 39,058 persons for ge assistance and $160,703 to 9,191 families for aid to de- ent children; and in August, $34,069 to 2,241 blind persons, '25 for general relief (by the county governments), and ,365 for unemployment compensation benefits. On Dec. 15, , WPA employment in the state was 9,800. The state main- d eight charitable institutions with 9,421 inmates on Nov. 1, ; five correctional institutions with 823 inmates; and state vay prison camps with 7,974 prisoners.

ommunication.—In 1942 the state highway and public works nission maintained 11,347 mi. of state highways, of which mi. were hard-surfaced, and 48,749 mi. of county roads, hich 2,364 mi. were hard-surfaced. There were 4,593 mi. of ads, 511 mi. of city bus routes, 6,385 mi. of passenger bus s and 8,923 mi. of freight vehicle routes. There were in ition across the state one east-west and two north-south ys.

nking and Finance.—On April 30, 1942, there were 44 nal banks with deposits of $161,713,000, loans of $57,219,000 investments of $39,184,000; and on June 30, there were 183 banks with deposits of $529,551,000, loans of $165,754,000 investments of $193,506,000. In 1941 there were 156 build- nd loan associations with total assets of $92,356,275.26. In -42 state receipts were $210,081,593; disbursements, $154,- 46. On June 30, 1942, the state gross bonded and net debts $133,736,500 and $113,942,103, respectively. The assessed of property was $2,496,247,967 in 1941. In the state gen- fund there was a cash surplus of about $30,000,000 at the of 1942.

griculture.—Increased acreage, production and value char- ized 1942 wartime agriculture in North Carolina. The total of production harvested from more than 6,500,000 ac. was oximately $464,000,000, of which tobacco alone accounted 228,509,000. The cash income of North Carolina farmers in was $240,481,000 from crops, $45,077,000 from livestock livestock products, and $14,474,000 from government pay- s. The value of the lands and buildings on the 278,276 farms 940, 44% of which were operated by tenants, was $736,- 125.

anufacturing.—In 1939 manufacturing establishments num- ig 3,225 employed 270,210 wage earners at wages of $199,- 501 and made products valued at $1,421,329.578. War needs produced an expansion of North Carolina industry in 1942.

Mineral Production.—The mineral production for North Carolina in 1940 was valued at approximately $20,000,000. In the production of mica and feldspar, North Carolina ranked first among the states.

BIBLIOGRAPHY.—U.S. Census; *Minerals Yearbook*, 1940, 1941; reports of state agencies; North Carolina newspapers. (A. R. N.)

North Dakota. A west north central state of the United States, popularly known as the "Flickertail state." Area, 70,054 sq.mi.; pop. (1940) 641,935. The rural population was 510,012; urban, 131,923. Capital, Bismarck (15,496). The chief cities are Fargo (32,580); Grand Forks (20,228); and Minot (16,577).

History.—The chief officers of the state in 1942 were as follows: governor, John Moses; lieutenant governor, Henry Holt; secretary of state, Thomas Hall; state auditor, Berta E. Baker; state treasurer, Carl Anderson; attorney general, Alvin C. Strutz; commissioner of insurance, Oscar E. Erickson; commissioner of agriculture and labour, Math Dahl.

Education.—Elementary schools in 1942 had an enrolment of 100,655; secondary schools, 32,548. The total number of schools was 3,935. The institutions of higher learning were the state university and school of mines, the agricultural college, three state teachers colleges, two normal schools, a school of forestry and a school of science. The total enrolment in these institutions in 1941 was 6,600 and their teaching staffs numbered 445.

Public Welfare, Correction.—The WPA during the fiscal year ending June 30, 1942 expended $4,171,742 of federal funds and employed an average of 6,382 per month. The number of correctional institutions in 1942 was seven and the average number of inmates was 565. The cost of maintenance was $1,500,000.

Communication.—Mileage on state highways on Jan. 1, 1942 was 7,330.6; of rural highways on Jan. 1, 1940, 107,361.6. State expenditures of the highway department for the year ending June 30, 1942 were $5,654,436.25. The total railway mileage in the state in 1941 was 5,269.92.

Banking and Finance.—In 1942 there were 114 state banks and one trust company, with resources of $47,256,629.70 and deposits of $42,864,030.31. Nineteen savings and loan associations had resources of $13,810,399.30 for 1941. For the year ending June 30, 1942 state receipts were $40,974,128.28, and expenditures were $37,186,090.16. The bonded indebtedness of the state was $21,076,850.00. New state capital building indebtedness was $172,000.

Agriculture.—The total farm acreage harvested in 1942 was 16,162,000 (excluding wild hay). The cash income from crops and livestock was (1941) $227,700,000, including benefit payments of $24,670,000. Cash income from livestock (1941) was $80,398,000.

Table I.—*Leading Agricultural Products of North Dakota, 1942 and 1941*

Crop	1942 (est.)	1941
Wheat, bu.	149,844,000	111,960,000

Northern Territory

OF AUSTRALIA. Area 523,620 sq.mi.; pop. (June 30, 1940): aboriginals, full-blooded, 13,901; half-caste, 902; white (est. Dec. 31, 1941), 9,615. Capital, Darwin (pop. Dec. 31, 1940, 3,900).

Early in 1942 the whole of the Northern Territory was proclaimed a defense area and the civilian population other than those engaged directly on defense work was evacuated. (*See* WORLD WAR II.)

Finance.—Revenue (1941–42), estimated, £A157,042; from Central Australia railway (1941–42), £A280,000; from North Australia railway (1941–42), £A230,000. Expenditure, ordinary appropriation (1941–42), £A525,860; new works, etc., £A450,000.

Production and Communication.—Production in 1939–40: pastoral industry, £A587,821; gold, £A233,789; wolfram, £A47,836; pearl shell, £A15,998. Railways, government (Dec. 31, 1941), 508 miles. (W. D. MA.)

Northwestern University.

An institution of higher learning at Evanston and Chicago, Ill. The university comprises the following divisions: the college of liberal arts, the graduate school, the technological institute, and the schools of music, education, speech, commerce and journalism, all located in Evanston (suburb of Chicago) on a campus bordering Lake Michigan; the medical, law and dental schools and the evening departments of the university, all on Chicago's near north side, on a campus six blocks from the loop business district.

The total of gifts for the fiscal year ending Aug. 31, 1942 amounted to approximately $925,000, which was received from more than 5,000 alumni and friends of the university.

The new $5,000,000 building of the technological institute was formally dedicated on June 15–16, 1942. Walter P. Murphy, who died Dec. 16, bequeathed another $20,000,000 to the institute, which he had established by a previous donation.

During 1942 the university's participation in the war effort was impressive. The following schools were conducted on the campus in co-operation with the army or navy: on the Chicago campus, the Naval Reserve Midshipmen's school, 2,200 men; on the Evanston campus, the Naval Radio Operators' school, 1,000 men, the naval R.O.T.C., 325 men, and the Army Signal Corps school, 170 men.

A total of 241 members of the faculty and staff were in the armed services or in vital civilian work for the government. Training for war industries was given in the technological institute to 2,600 men and women. Three hospital units, with personnel from the medical school faculty, were organized for the army and navy. Flight instructors and combat flyers were being trained in the technological institute. Scores of faculty members were engaged in war research of a confidential nature. For additional statistics of the university, *see* UNIVERSITIES AND COLLEGES.

Northwest Territories.

Area, 1,309,682 sq.mi.; p (1941 census), 11,271; seat government, Ottawa. The Northwest Territories comprise territories formerly known as Rupert's land and the Northwest territory, except such portions thereof as form the provinces Manitoba, Saskatchewan and Alberta and the Yukon territo together with all British territories and possessions in No America and all islands adjacent thereto not included within province, except Newfoundland and its dependencies. For adm istrative purposes the Territories were subdivided into the pro sional districts of Mackenzie, Keewatin and Franklin by ord in-council of March 16, 1918. The Northwest Territories governed by the commissioner, the deputy commissioner and councillors appointed by the governor general in council. commissioner in council has power to make ordinances for government of the Territories under instructions from the gov nor general in council or the minister of mines and resources, s ject to any act of the dominion parliament applying to the T ritories respecting such matters as direct taxation within the T ritories in order to raise revenue, etc., establishment and t ure of territorial offices, maintenance of municipal instituti licences, solemnization of marriages, property and civil righ administration of justice, education and generally all matters a local nature.

Communications.—Two well-organized transportation com nies maintained regular boat service for both passengers freight in 1942, leaving end of steel at Waterways, Alberta, destined to points in the Mackenzie district served by water tra portation. Regular and frequent commercial air service connec Edmonton, Alberta, with the Mackenzie district and carried m The eastern Arctic was served by a yearly supply ship from Mo real and smaller boats operating from Churchill. Strategica placed government radio stations, supplemented by sets opera by trading companies and others, maintained wireless commu cation throughout the Territories and with centres of populat in the provinces.

Trade.—The main activities are the fur trade and the min industry. Furs to the value of approximately $1,325,000 are ported annually. Natives and half-breeds living the life of nati enjoy free hunting and trapping rights. Of the white reside only those who, under the regulations, are included in an est lished eligible list are permitted to hunt and trap and such in viduals require an annual licence. Fur trading is controlled regulation and only those who have been issued permits and have established permanent posts are able to engage in the trade. Reindeer herding in the northern Mackenzie district being developed in the interests of the native population.

Mineral Production.—Wartime demands for tungsten other strategic minerals were responsible for increased prospe ing and exploration activity in the Northwest Territories in 19 The output of gold on a commercial basis commenced with pouring of the first gold brick at the Con property of the Cons dated Mining and Smelting Company of Canada, Ltd., on the w side of Yellowknife bay, in September 1938. Six other propert came into production, namely, Negus Mines, Ltd., Slave L Gold Mines, Ltd., Thompson-Lundmark Gold Mines, Ltd., Ry Mines, Ltd., Ptarmigan Mines, Ltd., and the Ruth Mine. Ptar gan and Ruth mines were closed temporarily in August 1942. total value of gold produced from these properties excee $9,000,000, the largest producer being the Con mine. The proximate average monthly production from these properties the year was: Con, $150,000; Thompson-Lundmark, $75,0 Negus, $65,000; Ptarmigan, $50,000; Slave Lake, $20,000; Ry $10,000. The pitchblende-silver property of Eldorado Gold Mi Limited, at Great Bear lake, which was closed down in June 19 s re-opened in August 1942. The mill at this property treats re than 100 tons of radium-bearing ore daily. (R. A. G.)

orway. A country of northern Europe, bounded N. by the Arctic ocean, E. by Finland and Sweden, S. and W. the North sea. Area 124,556 sq.mi.; pop. (est. 1939) 2,921,- o. Capital, Oslo (253,124). Other principal cities, with 1930 pulations, are Bergen (98,303); Trondhjem (54,458); and avanger (46,780). Religion, Lutheran Christian. Ruler in 1942: ng Haakon VII (*q.v.*). Prime Minister: Johan Nygaardsvold exile in London). Norway was occupied by Germany in 1940, d was administered in 1942 through Reichscommissar Josef rboven, and Premier Vidkun Quisling (after Feb. 1).

History.—Norway experienced intensification of conflict in 42. From bases there the Germans slashed out at Russia-bound nvoys, attacking under the water, on the surface, from the air. e nazis also felt it necessary to strengthen their defenses on coast, and forced Norwegian labourers to build roads and tifications. German garrisons were increased by some 75,000 n in March. Opposition and sabotage led to ruthless counter- asures. Herr Rediess, chief of the Gestapo in Norway, executed res. In October Trondhjem suffered under a veritable reign of ror. For the killing of two Germans the entire village of Tele- g was wiped out—men killed, women and children removed, ldings burned. Later Bulandet was likewise destroyed. Many perties were confiscated, and fines levied, the city of Stavanger, example, having to pay a levy of 6,000,000 kr. Some 1,000– oo Norwegians were taken to concentration camps in Germany, ong such prisoners being Didrik Arup Seip, rector of the Uni- sity of Oslo. One thousand Jews were deported in November, l a small remaining group awaited the same fate at the end the year.

Despite such stringent measures, opposition grew. Two hundred illegal papers spread news from home and abroad. Fires broke out. Accidents increased; one of the most notable was that in which Gulbrand Lunde, the Quisling minister of propaganda, was thrown into an icy fjord in his car and drowned. Police minister Jonas Lie disappeared also—perhaps at the front. From outside came timely aid, such as the British raids on the naval base at Trondhjem and the spectacular air attack on Oslo, Sept. 25, when Quisling and the nazis were celebrating two years of the New Order in Norway.

LY WEEK IN NORWAY," a reference by Lewis in the *Milwaukee Journal* idkun Quisling's high-handed methods of suppressing the opposition of Nor- ian bishops to state-controlled religion in 1942

Three particularly effective groups working in opposition to the invaders were the labourers, the clergy and the teachers. Labourers resigned en masse from the nazi-controlled unions, slowed down their work and practised ingenious sabotage. The seven bishops of Norway, led by Eivind Berggrav, all resigned on Feb. 24 in protest against state interference and dictation. Quisling's policies finally led to the mass resignation of 1,100 clergymen, and ultimately to the declaration of the church as a "free church" completely separate from the state (July). Quisling's own "church council" gained small support. Only about 40 ministers sided with the Quislingites, and the German authorities advocated a relaxation of Quisling's attacks. The overwhelming majority of the teachers of Norway refused to join the nazi teachers' association; for a time all schools were closed as the state tried to discipline the obstreperous pedagogues. About 1,700 were arrested and several hundred, sent north to work on roads, were treated with exceptional brutality.

On Feb. 1 Vidkun Quisling was made premier, and was maintained in office although he did not gain popular support.

The United Nations appreciated the effective work of Norwegian opposition at home, the aid of the Norwegian merchant fleet, and of the airmen from Camp Little Norway (in Canada). To show her admiration, the U.S. raised the rank of its envoy to the Royal Norwegian government to ambassador, and President Roosevelt personally handed over to the Norwegian navy a subchaser christened "King Haakon VII."

Education.—In 1937–38 there were 357,793 students and 10,521 teachers in the elementary schools; 31,127 students and 1,809 teachers in the middle schools and gymnasia, and 16,033 students in continuation schools. The 11 universities had a combined enrolment of 4,998. The total state budget for educational purposes in 1939–40 was 65,364,000 kr.

Defense.—The budget for 1939–40 was 54,762,000 kr.; Jan.–June 1941 (by govt. in London), 21,385,543 kr.

Army. Under the law in force in 1940, compulsory service began at age 20, extended for 12 years in the regular army and 12 years in the "Landvaern." About 30,000 men became liable annually, and served a training period of 84 days. In 1939 permanent personnel included 1,135 officers, 765 noncommissioned officers and 12,500 men.

Navy. The navy on Jan. 1, 1941 had two coast-defense ships, 16 torpedo boats and 6 submarines. By the end of 1942 it was claimed this strength had been increased, largely by the use of some of the over-age U.S. destroyers.

Finance.—The monetary unit is the krone (23.4 U.S. cents in 1939). Budgetary income and expenses for 1937–38 balanced at 572,135,000 kr.; the proposed budget of 1939–40 was 595,627,000 kr. The government in London planned expenditures of 142,827,636 kr. in the first six months of 1941 and of about 92,000,000 kr. in the second six months of 1942. Nearly one-sixth of this was for payments on the state debt. Income was largely from the merchant fleet, requisitioned early in the war. The state debt Dec. 31, 1938 was 1,430,395,000 kr.

On Dec. 31, 1938 the Norges bank had capital of 35,000,000 kr. and deposits of 130,643,000 kr.; 711 private and savings banks had deposits of 2,928,000,000 kr.

Trade.—In 1939 exports were valued at 808,172,000 kr.; imports, 1,361,835,000 kr. The imports rose rapidly in the last three months, while Norway built up stocks for the war period.

Communication.—In 1939 there were 2,335 mi. of state railways and 25,677 mi. of highways (11,857 mi. improved, 13,820 unimproved). In 1938 there were 107,657 motor vehicles. Norwegian air lines flew a total of 85,000 mi. in 1938. Telephones numbered 122,664; telegraph lines extended 21,875 mi.; radio receivers (licensed) numbered 400,623.

Agriculture.—The total value of agricultural products in 1938 was 384,207,000 kr.; of animal products (eggs, milk, wool, etc.), 428,000,000 kr.; furs, 30,000,000 kr. Landholdings numbered 562,407 (298,360 operating units) with a value of 2,410,101,000 kr. Leading crops were wheat 15,791,000 kr., rye 2,197,000 kr., barley 22,382,000 kr. and oats 31,479,000 kr. In 1938 total productive forest area was one-quarter of the total land area, or 18,700,000 ac.

Fisheries.—The total catch of fish in 1937 was 903,646 tons, the value of which was 92,272,000 kr.; 523,000 tons of the total was herring of various kinds.

Manufacturing.—In 1937 there were 4,306 establishments which turned out products valued at 2,023,551,000 kr. According to value of the product, the most important industries were food and tobacco 411,109,000 kr., paper, cellulose 309,733,000 kr., iron and metal 308,169,000 kr., mining 216,511,000 kr., textile 144,488,000 kr., and wood, furniture, etc. 140,756,000 kr.

Mineral Production.—In 1938 the principal mineral product was iron ore, valued at 26,665,000 kr. Pyrites, valued at 18,168,000 kr., and copper, valued at 5,013,000 kr., were respectively the second and third minerals. (F. D. S.)

Notre Dame, University of. An institution of higher education at Notre Dame (South Bend), Ind. The year 1942 marked the 100th anniversary of the founding of the university (Nov. 26). Officially, the centenary year was opened with the fall semester in Sept. 1942, to conclude with the closing of the summer semester in Sept. 1943. But the concurrence of war cancelled many of the programs, meetings of learned societies and publications which were to feature the year-long observance.

Beginning in Jan. 1942 Notre Dame adopted the accelerated three-semester academic year to facilitate wartime training. In April the navy, already having established an N.R.O.T.C. at Notre Dame, occupied residence halls and other facilities on the campus for the conduct of an indoctrination school for midshipmen. The university students doubled up in the remaining facilities, and the entire subsequent year found a normal capacity undergraduate enrolment existing in conjunction with some 1,300 navy trainees. In Oct. 1942 the Notre Dame indoctrination school was reclassified as a complete midshipmen's school, with a four-months course leading to the ensign's commission.

Two acting deans were appointed during 1942, Raymond J. Schubmehl in the college of engineering, and Lawrence H. Baldinger in the college of science.

Emphasizing its policy of cultivating liberal arts in a war era, the university awarded the 1942 Laetare medal to Helen Constance White, author and professor at the University of Wisconsin. In addition to the direct uses of its facilities for students and navy training, Notre Dame's campus and equipment, and faculty to a limited extent, participated in a program of training for men and women in defense, especially in chemistry, physics, engineering and management. For statistics of enrolment, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.

Nova Scotia. One of the three maritime provinces of th Dominion of Canada, admitted to the union i 1867; area 21,428 sq.mi.; pop. (1941), 577,962. Capital, Hal fax (69,326); estimated wartime population 1942, 120,000. Othe cities are Sydney (28,081) and Glace Bay (25,050) both centre of coal, iron and steel industries. The lieutenant governor i 1942 was H. E. Kendall; the premier A. S. MacMillan.

Education.—The number of students in provincially controlle schools in 1942 was 122,378; in private schools, 3,459; in institutions of university standard, 2,389.

Communications.—The mileage of surfaced highways in 194 was 6,234; earth highways, 8,853; provincial expenditure o highways, $1,746,369. The railroad mileage in 1942 was 1,396; the number of telephones, 52,251.

Finance.—The ordinary receipts in 1942 were $16,443,946; ordinary expenditure, $15,497,608. The direct debt (less sinkin funds) was $98,478,264; indirect liabilities (less sinking funds), $3,181,812.

Agriculture.—The acreage of field crops in 1942 was 551,600; gross value of field products, $16,056,000; gross value of al crops, $29,810,000.

Table I.—*Leading Agricultural Products of Nova Scotia, 1941 and 1940*

Crop	1941	1940
Oats, bu.	3,094,000	3,265,000
Turnips, cwt.	3,300,000	3,511,000
Potatoes, cwt.	2,091,000	2,319,000
Hay and clover, tons	667,000	649,000

Manufacturing.—The gross value of manufactured products in 1940 was $113,814,650; net value, $40,548,446; number f employees, 21,062; salaries and wages, $21,519,617.

Table II.—*Principal Industries of Nova Scotia, 1939 and 1938*

Industry	Value of products	
	1939	1938
Steel works	$15,223,484	$11,183,267
Fish packing	6,531,571	6,471,510
Pulp and paper	5,523,373	5,933,523
Railway rolling stock	2,507,399	3,246,033
Sawmills	2,954,498	3,013,284

Mineral Production.—The value of the mineral production i 1940 was $33,318,587. The Inverness field had been closed.

Table III.—*Principal Mineral Products of Nova Scotia, 1940 and 1939*

Mineral	Value	
	1940	1939
Coal	$28,766,195	$25,611,271
Gypsum	1,302,347	1,340,830
Gold	855,432	1,082,170

Nuts. Owing to the rubber shortage, imports of Brazil nuts into the United States in 1942 were practically forbidden. The United States and Brazil agreed to limit the market for these nuts, thereby inducing natives in Brazil to gather latex from the wild rubber trees as a more profitable occupation. Preliminary estimate of the 1942 crop in the Amazon basin was 26,300 short tons, unshelled basis. Before World War II interfered with shipping, the crop approximated 40,000 short tons annually.

U.S. Production of Pecans by States, 1942 and 1941

State	Improved Varieties 1942 lb.	Wild 1942 lb.	Improved Varieties 1941 lb.	Wild 1941 lb.

The 1942 crop of pecans in the United States, produced in states, was 78,100,000 lb., of which 45,630,000 lb. were of proved varieties and 32,470,000 lb. of wild or seedling varies. In 1941 production was 51,027,000 lb. of improved rieties and 70,461,000 lb. of wild; the ten-year (1930–39) erage, 26,808,000 lb. of improved varieties and 54,358,000 lb. wild. Almonds, grown only in California, yielded 22,000 tons 1942 compared with 6,000 tons in 1941 and a ten-year average 13,800 tons. English walnuts, grown commercially in Calinia and Oregon, yielded in 1942: California, 57,000 tons; egon, 3,600 tons. In 1941 the walnut crop was: California, 000 tons; Oregon, 7,000 tons. The ten-year average: Calinia, 44,730 tons; Oregon, 3,080 tons. The commercial crop filberts in 1942 was as follows: Oregon, 3,900 tons; Washton, 670 tons. The 1941 crop of filberts was: Oregon, 4,900 s; Washington, 850 tons. The ten-year average was: Oregon, 55 tons; Washington, 242 tons. Pecans are the most widely wn and important nut crop in the United States.

Reports on nut crops in other countries were fragmentary. eliminary estimates reported a bumper 1942 crop of filberts Turkey—77,000 tons, unshelled—compared with 33,000 tons 1941. Preliminary forecast for the 1942 filbert crop in Spain s 21,800 short tons, compared with 20,900 tons in 1941. The anish almond crop was forecast at 27,500 short tons, shelled sis, for 1942 as against 24,200 tons in 1941. (*See* also Coco-TS; PEANUTS.) (S. O. R.)

ts.

The largest oats crop since 1925 was harvested in 1942 in the United States—1,358,730,000 bu. from 37,899,000 The yield, 35.9 bu. per ac., was the highest since 1915, a fortunate situation because of the need of maintaining the oats ration for the increased numbers of livestock on farms in 1942. In Texas only one-third of the average acreage was harvested because of insect damage. Oklahoma, Georgia and South Carolina also had yields below average. The 1941 crop was 1,180,663,000 bu. from 37,965,000 ac. and the yield was 31.1 bu. per ac. The ten-year (1930–39) average was 1,016,061,000 bu. from 36,653,000 ac.; the yield, 27.4 bu. per ac. Canadian production in 1942 was 692,724,000 bu.; 324,673,000 bu. in 1941 (U.S. bu. of 32 lb.).

Oceanography. While, because of the war, field observ tions continued to be curtailed, the analys and publication of accumulated observations continued. Th most notable oceanographic event of 1942 was the appearan of two up to date text books, the first complete and authoritati works in many years.

Ocean Currents.—A study of four hydrographic sectio crossing the straits of Florida near Havana indicated variatio in total transport between 26.0 and 30.3 million cubic mete per second for the month of March. A counter current in th deep water north of the Florida current appeared to be a chara teristic of this part of the straits.

Plankton.—Recent plankton studies emphasized the importan of vertical movements in maintaining an adequate supply nutrients near the surface. For example, the rate of increase the plankton population in the spring on Georges Bank seeme to be a linear function of the reciprocal of the thickness of t wind-stirred surface layer. In the open Pacific a positive corre tion was found between the density of plankton in the upper metres and the phosphate content of the water. It was also sho that surface waters richer in phosphate occurred in regions wh vertical movements, which carried phosphate up into the surfa layer from the rich reservoirs below, could be associated wi the permanent currents. (*See* also Fisheries; Marine Biolog; Zoology.)

ker, William C. (1880–1942), U.S. aviation inventor, was born June 18 in Philadelphia, Pa. An ert pilot with one of the longest records of service in the S. army air corps, Col. Ocker first saw action in the Spanish-erican War. He re-enlisted in 1912 in the aviation section the signal corps and qualified for a pilot's licence two years er. He rose in rank to colonel in 1940, by which time he had n commanding officer at various flying fields. In the 1920s experimented with instrument flying, and in 1930 he piloted lane with a covered cockpit for 900 mi. from San Antonio, x., to Scott Field, Ill., solely by instruments. He invented ious training devices for students of "blind-flying," including "flight integrator."

Ocker was co-inventor of the "pre-flight reflex trainer" and a new type of propeller that was said to lessen noise, vibra- n and strain in the blades. He died in Washington, D.C., t. 15.

Flanagan, Michael (1876–1942), Irish clergyman and politician, was born August 13 in onfower, Castlereagh, County Roscommon. A college profes- and curate, he joined the Sinn Fein movement, becoming its e-president in 1917, and was one of De Valera's chief aides ring the turbulent civil war years, 1916–22. In 1920, Father Flanagan, who was acting Sinn Fein president while De Valera s in America, sent a wire to Prime Minister David Lloyd orge, declaring that Ireland was willing to make peace. Nothing ne of the Sinn Fein leader's proposals, and he was subsequently med by Irish patriots for Ireland's failure to secure complete ependence in 1922 instead of dominion status. He died in blin, August 7.

io. A north central state of the United States, popularly known as the "Buckeye state." Area, 41,222 sq.mi.; pop. 940) 6,907,612, of whom 2,294,626 were rural and 4,612,986 ban; native white 6,047,265, foreign born 520,773, Negro 339,- 1, other races 1,620. Capital, Columbus (306,087). Other ies of more than 100,000 were Cleveland (878,336), Cincinnati 55,610), Toledo (282,349), Akron (244,791), Dayton (210,-718), Youngstown (167,720) and Canton 108,401.

History.—Gov. John W. Bricker in Nov. 1942 was re-elected by the largest majority and with the highest percentage of the total vote ever won by a candidate for governor of Ohio. He was the first Republican governor to be elected for three consecutive terms. This election record made Gov. Bricker a leading potential candidate for the Republican presidential nomination in 1944. His majority over former Congressman John McSweeney (Dem.) of Wooster was 375,654, and he carried all but two of the 88 counties.

The entire Republican state ticket was elected by substantial majorities. Lieut. Gov. Paul M. Herbert of Columbus, Treasurer of State Don Ebright of Akron and Attorney-General Thomas J. Herbert of Cleveland were returned to office for their third consecutive terms. Edward J. Hummel of Cincinnati was elected secretary of state. The only Democrat left holding state office was Auditor of State Joseph T. Ferguson, who was in the middle of a four-year term. The Republican party also won overwhelming control of the state legislature. In the 23 congressional contests, only three Democrats survived the Republican landslide. Charles S. Bell of Cincinnati was elected to the Ohio supreme court, and Judges Roy H. Williams of Sandusky and Edward C. Turner of Columbus were re-elected. All ran on the Republican ticket.

The state legislature, which adjourned May 17, 1941, did not meet at all in 1942. Although mayors and city managers of 14 Ohio municipalities repeatedly urged Gov. Bricker to call the legislature into session to consider some form of financial aid to cities for the civilian defense program, and Democrats charged that he was not supporting the national war effort but was piling up a huge surplus in the state treasury which rightfully belonged to the local subdivisions, the governor steadfastly refused to convene the legislature. He maintained that he had co-operated with the federal government in every respect, that the state civilian defense organization was efficient and that the surplus, which exceeded $30,000,000 by the end of 1942, would make new taxes unnecessary during the next two years, when state revenues were expected to fall because of rationing and priorities.

Education.—Ohio in 1942 had 3,828 elementary schools with a total enrolment of 708,343 (including 21,652 children in kindergartens) and a total teaching staff of 22,470 (including 392 kindergarten teachers); 1,350 secondary schools with a total enrolment of 469,101 (including 83,837 pupils in junior high schools) and a total teaching staff of 28,160 (including 2,860 junior high school teachers).

Public Welfare, Charities, Correction.—Ohio's relief-case load for Nov. 1942 was 24,243, the lowest since the state started keeping relief records. The average number of general relief cases for 1942 was 33,362 and the total spent was $7,870,596. Average of WPA employment was 30,563, at a total cost of $24,651,356; average number of cases of aid for the aged, 139,123, at a total cost of $41,250,821; average number of cases of aid to dependent children, 11,387, at a total cost of $5,310,003; average number of cases of aid to the blind, 3,928, at a total cost of $991,833; number of weeks of unemployment compensated (11 months) 1,178,-911, the net amount of benefit payments being $14,064,162. In 1942 the four penal institutions had an average population of 7,736 and were operated at a total cost of $2,478,861. The two industrial schools had an average population of 1,172 and were operated at a total cost of $609,084.

Communication.—Ohio had 86,563.54 mi. of highways in 1942 outside municipalities. Of this total 16,261.64 mi. were classified as state mileage, 28,352 county mileage and 41,949.90 township mileage. Estimated expenditures on the state highway system in 1942 were $36,500,000. The state had 8,870.26 mi. of railroads, 111 airports and landing fields and 1,480,398 telephones.

Banking and Finance.—There were 446 state banks in Ohio with deposits (Sept. 28, 1942) of $2,077,160,739 and resources of $2,264,650,121. There were 241 active national banks in Ohio with deposits (June 30, 1942) aggregating $1,525,397,000 and resources of $1,679,020,000. State-chartered savings and loan associations numbered 547 with total resources (June 30, 1942) of $661,244,108.

There were 122 federal savings and loan associations with total assets (Dec. 15, 1942) of $271,598,614. The state budget for the 1941–42 biennium was $352,800,000.

Agriculture.—The total acreage harvested in Ohio in 1942 was 10,359,500; in 1941, 9,906,500. Total value of agricultural production in the state in 1941 was $491,101,000. A wet harvest season cut Ohio wheat production in 1942, but the corn and soybean crops set new records in spite of a shortage of harvest labour.

Table I.—*Leading Agricultural Products of Ohio, 1942 and 1941*

Crop	1942	1941
Corn, bu.	185,752,000	160,974,000
Wheat, bu.	36,205,000	48,978,000
Oats, bu.	51,824,000	51,374,000
Barley, bu.	1,428,000	1,140,000
Rye, bu.	1,649,000	1,332,000
Soybeans, bu.	28,819,000	13,143,000
Potatoes, bu.	9,180,000	10,614,000
Apples, bu.	6,384,000	6,000,000
Tame hay, tons	3,659,000	3,325,000
Tobacco, lb.	23,948,000	25,311,000

Manufacturing.—The total value of manufactures in Ohio in 1939, was $4,584,665,659; total employment, 686,089; total wages and salaries paid, $1,033,426,673.

Mineral Production.—The total estimated value of mineral production for Ohio in 1940 was $61,457,191.

Table II.—*Principal Mineral Products of Ohio, 1940 and 1939*

Mineral	Value, 1940	Value, 1939
Bituminous coal	$37,114,560	$32,981,760
Petroleum	3,514,560	3,534,720
Coke	36,725,369	28,502,924
Pig iron	180,700,876	147,154,864
Natural gas	21,132,280	18,818,000
Sand and Gravel	9,230,358*	6,595,483

*1941.

(P. By.)

Ohio State University.

An institution of higher education at Columbus, Ohio. Formally established as a land-grant institution in 1870, it opened its doors on Sept. 17, 1873, to a student body of 17.

The university admits both women and men. It has ten colleges: agriculture, arts and sciences, commerce and administration, dentistry, education, engineering, law, medicine, pharmacy and veterinary medicine; a graduate school; and five special schools: home economics, journalism, nursing, optometry and social administration. Graduate work is offered through the doctor of philosophy degree. Special curricula in 1942 prepared women and men for war work. New departments of occupational therapy and physical medicine were created. Latest additions to the physical plant were a 400-acre airport and a war research laboratory. The university for 20 years had operated on a four-quarter plan, enabling most students to complete their studies in three calendar years.

For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. Dr. Howard L. Bevis, president, took office Feb. 1, 1940. (H. L. B.)

Oklahoma.

A west south-central state and the 46th of th United States. The people of the state are pop larly known as "Sooners," from the name applied to those wh crossed the starting line sooner than the time fixed by the gover ment for the first land run into Oklahoma, April 22, 1889. Are 69,283 sq.mi.; pop. (1940) 2,336,434, a decrease of 59,606 sin 1930. The rural population in 1940 numbered 1,456,771; urba 879,663. Approximately 87% of the population was native whit 7% Negro, 4% Indian and 2% foreign born, Mexican and misce laneous. The state's two largest cities are Oklahoma City (204 424), the capital, and Tulsa (142,157).

History.—Perhaps the most important development durin 1942 was the adoption in November of a constitutional amen ment making women eligible for election to all state office Another constitutional amendment was adopted in July authori ing the legislature to provide for retirement pensions for teacher The fiscal year 1941–42 ended with a large surplus, and tax co lections indicated a surplus for the fiscal year 1942–43. Th administration of Governor Leon C. Phillips ended with the b ginning of 1943. At th November election, Rob ert S. Kerr was chosen t succeed Phillips as gov ernor. Others electe were: lieutenant gove nor, James E. Berry; se retary of state, Frank Carter; state auditor, C. Childers; attorney ge eral, Mac Q. Williamson state treasurer, A. S. Shaw; state superinten ent of public instructio A. L. Crable.

ROBERT S. KERR, governor of Oklahoma, elected Nov. 3, 1942, on the Democratic ticket

Education. — In th public schools in 1941–4 528,293 pupils were en rolled, with 19,391 teach ers. Of these pupils, 128 603 were enrolled in the 854 public high schools. The expenditu for the maintenance of public schools, elementary and secondar during the fiscal year amounted to $32,625,955. The state 1942 maintained a university at Norman, a state agricultur and mechanical college at Stillwater, the Panhandle agricultur and mechanical college at Goodwell, four agricultural junio colleges, a college for women, six state colleges primarily fo teachers, an agricultural, mechanical, and normal university fo Negroes at Langston, two academic junior colleges, and a mil tary academy.

There were twelve municipal junior colleges. In additio there were six accredited colleges and three junior colleges wit church affiliations.

Public Welfare, Charities, Correction.—During 1941–4 77,749 persons were the recipients of old-age assistance, 2,18 blind persons received aid, and 19,941 dependent children wer cared for; 2,059 were enrolled in CCC camps, 8,968 were em ployed by the NYA (1,971 in school and 6,997 out of school and 19,069 were employed by the WPA.

The hospitals and eleemosynary institutions in 1942 includ five mental hospitals, three tuberculosis sanitariums, two orphan homes, one school for the deaf, and one for the blind. The was also one penitentiary, one reformatory, and four schools detention and correction.

Communication.—Oklahoma maintained approximately 10 000 miles of state and rural highways in 1942, not includi eets in towns and cities. Annual expenditures for roads were proximately $23,000,000. Within the state there were 6,478 les of railroad.

Banking and Finance.—National banks numbered 207 in ne, 1942, with capital of $55,589,000 and deposits of $503,-,000. There were 182 state banks with capital of $9,477,000 l deposits of $74,539,000. There were 32 federal savings and n associations with resources of $53,200,000 and 32 state ociations with resources of $12,700,000. State receipts during 1–42 were $81,369,741.67, besides $20,498,830.42 received m the federal government; expenditures were $87,169,607.50. e state funded debt in 1942 stood at $36,106,735.68.

Agriculture.—No extended droughts occurred during 1941 or 2, which were on the whole good crop years. The total num- of acres harvested in 1942 was 12,763,600, as compared with 350,200 harvested in 1941. The cash income to farmers in 1 was $123,591,000 from crops, $132,985,000 from livestock, l $21,035,000 from government payments, a total of $277,-,000.

Table I.—*Leading Agricultural Products of Oklahoma, 1942 and 1941*

Crop	1942 (est.)	1941
heat, bu.	57,370,000	48,610,000
rn, bu.	35,631,000	31,202,000
ts, bu.	23,940,000	25,900,000
ain sorghums, bu.	13,260,000	13,260,000
rley, bu.	10,625,000	9,216,000
tton, bales	720,000	718,000
y, tons	1,716,000	1,716,000
oomcorn, tons	11,900,000	10,200,000

Manufacturing.—Total value of manufactures in 1939 was 2,168,499, as compared with $366,088,721 in 1937. State in-tries employed 33,528 persons; salaries of $11,090,299 and ges of $30,465,185 were paid.

Table II.—*Principal Industries of Oklahoma, 1939 and 1937*

Industry	1939	1937
troleum refining	$106,666,837	$144,474,915

iver, Edna May (1883–1942), U.S. actress, was born Nov. 9 in Malden, Mass. She studied sic, dancing and voice when a child and in 1900 made her first fessional stage appearance in light opera. She later toured as pianist with an orchestra of women and played minor roles in stock shows. A versatile actress, Miss Oliver made a success on Broadway as the comedienne in *Oh Boy!,* in 1917; she later scored in a tragic part in *Ice-Bound* in 1923. The long-faced, taut-lipped actress excelled in portraying sharp-tongued spinsters and was acclaimed as one of the leading "scene-stealers" in motion pictures on the basis of her performances in *Little Women* and *David Copperfield.* Other films in which she appeared were *Alice in Wonderland, A Tale of Two Cities, Nurse Edith Cavell* and *Pride and Prejudice.* She died in Hollywood, Calif., Nov. 9.

Oliver, Sir Thomas (1853–1942), British physician and authority on industrial diseases, was born March 2 in St. Quivox, Ayrshire. He studied at the Glasgow university and in Paris schools before starting his medical practice in 1875. Sir Thomas specialized in industrial diseases, became an authority on industrial safety measures and was influential in improving the social conditions of workers. He wrote extensively on industrial diseases, served as medical expert of the dangerous trades committee of the Home Office and was honorary president of the International Congress of Accidents and Industrial Diseases at Geneva, 1931. He was also president of the University of Durham college of medicine, Newcastle, and vice-chancellor of Durham university, 1928–30. He died at Newcastle, May 16.

Oman and Muscat: *see* ARABIA.

Ontario. One of the two central provinces of the Dominion of Canada (*q.v.*), admitted to the union in 1867; area, 412,582 sq.mi.; pop. (1941) 3,787,655. Capital, Toronto (667,-457). The population in 1941 was 80% native born and 62% urban. The lieutenant governor in 1942 was Albert Matthews; the premier G. D. Conant.

Education.—The number of students in provincially controlled public schools in 1942 was 708,180; in private schools 21,264; in institutions of university standing 19,185.

Communications.—The mileage of surfaced highways in 1942 was 56,309; of earth highways 16,137; provincial expenditure on highways $16,081,059. The railroad mileage in 1942 was 10,562, number of telephones 660,002.

Finance.—The ordinary receipts in 1942 were $106,384,870; ordinary expenditure $109,618,967. The direct debt (less sinking funds) was $729,815,356; indirect liabilities (less sinking funds) $129,603,233.

Table I.—*Leading Agricultural Products of Ontario, 1942 and 1941*

Crop	1942	1941

Oranges. The orange crop in the five producing states of the United States in 1942 was about the same as in 1941 and in 1940, the only noticeable change being that a materially larger part of the crop was shipped by rail. Gasoline and rubber shortages affected the usual truck shipments. Railroad car loadings were well above those of previous years, owing to shortage of shipping facilities. The 1942 crop was 84,144,000 boxes, according to a preliminary estimate of the department of agriculture in Dec. 1942.

The 1941 crop was 84,534,000 boxes and the ten-year (1930–39) average was 60,179,000 boxes. A prolonged fall drought in Florida, although relieved by December rains, reduced the early and midseason crops. (S. O. R.)

U.S. Production of Oranges by States, 1942 and 1941

State	1942 boxes*	1941 boxes*
California

Navels and miscellaneous	17,160,000	22,327,000
Florida		
Early and midseason	16,500,000	15,200,000
Valencias	15,000,000	12,000,000
Tangerines	3,500,000	2,100,000
Texas	2,900,000	2,850,000
Arizona	700,000	660,000
Louisiana	340,000	192,000

*Net content per box of oranges in California and Arizona approximates an average of 70 lb.; in Florida, Texas and Arizona, 90 lb.

Oregon. A Pacific state of the U.S.A., admitted to the union Feb. 14, 1859. Area, 96,350 sq.mi.; pop. (1940) 1,089,684. Capital, Salem (30,908); chief city, Portland (305,394).

History.—Oregon was the second state of continental United States to be attacked by the enemy in World War II and the first to be bombed from the air. On the night of Sunday, June 21, 1942, several explosive shells were fired from the sea, presumably from a Japanese submarine. They landed among the sand dunes of Sunset beach south of the mouth of Columbia river in the extreme northwest part of the state. On the morning of Sept. 9, a very small plane was seen flying eastward in the vicinity of Brookings, in the extreme southwest corner of the state, and shortly thereafter a forest service lookout on rugged Mount Emily heard explosions. Later some bomb fragments were found and pieces of incendiary material. The plane was apparently based on a Japanese submarine. The damage in both of these attacks was negligible.

Oregon's contribution to the war effort in 1942 was largely in shipbuilding and lumber production. The metropolitan area Portland, including Vancouver, Washington, became the cent of a highly organized ship construction program, producing variety of vessels in many different yards. The U.S. Maritin commission announced that the Oregon Shipbuilding corporatio operated by Henry J. Kaiser, held the United States record f 1942 by turning over to the commission 113 completed Liber ships.

Two large army camps were put into service in 1942, and the close of the year an army engineer training and replaceme camp was announced for central Oregon. In addition, the arm and navy put into operation a number of auxiliary establishmen including some large installations.

On Nov. 18 at Oregon state hospital (mental), Salem, a qua tity of sodium fluoride was accidentally mixed with powdered eg for the evening meal; as a result 47 patients, mostly helpers, die

In the November election, Oregon took a leading position the return to the Republican party. Republican congression state and legislative tic ets were almost all su cessful, in some cases record-breaking plura ties. Earl Snell, Repub can, was elected gove nor. The legislature m in Jan. 1943 and fou state finances in excelle condition. The bienn state budget as submitt to the legislature, inclu ing deficiencies, amou ed to $32,300,860, wi sufficient revenues ava able.

EARL SNELL, Republican, elected governor of Oregon Nov. 3, 1942

Outstanding among t problems of 1942 was t great increase in popu tion in the Portland m ropolitan area. There we substantial difficulties transportation and housing, and toward the end of the year meat supply. Reasonably good solutions were found.

Education.—In 1941 there were 206,715 pupils in pub schools, including 68,594 in high schools. There were 7,8 teachers.

For the school year 1941–42 the value of school propert was $62,160,199.

Communication.—On Dec. 31, 1942, there were 4,809 mi. primary state highways, of which 4,368 were surfaced. Highw expenditures for 1942 were $15,586,827, of which $2,618,790 w for interest and debt retirement. As of Dec. 31, 1941 there we 3,665 mi. of steam railways, not including second main tra sidings, etc.

Finance.—Oregon's bonded debt as of June 1942 was $1 567,375.

Agriculture.—The total cash income of Oregon farmers 1941 was $151,612,000, of which $4,545,000 represented gove ment payments.

Table I.—*Principal Agricultural Products of Oregon, 1942 and 1941*

Crop	1942 (est.)	1941	Crop	1942 (est.)	1941
Corn, bu.	1,742,000	1,920,000	Barley, bu.	10,075,000	6,048,0
Oats, bu.	10,064,000	10,426,000	Spring wheat, bu.	2,112,000	3,105,0

Manufacturing.—The census of 1939 showed 2,248 manuf ing establishments in Oregon; 69,880 persons employed; ıries and wages, $91,326,581; value of products, $365,374,436. jor items: logging camps, $23,363,038; sawmills, $108,663,- ; planing mills, $8,122,845; meat packing, $15,178,448; paper ls $15,698,747.

Table II.—*Principal Mineral Products of Oregon, 1940 and 1939*

	Value, 1940	Value, 1939
ld.	$3,980,000	$3,268,020

Mineral Production.—The mineral production of Oregon in 9–40 was as indicated in Table II. (L. A. Mc.)

tiz, Roberto M.

(1886–1942), Argentine president, was born September 24 in Buenos Aires. graduated from the University of Buenos Aires in 1909 and le at school joined the Radical party, then unified under the lership of Hipolito Irigoyen. He was a member of the city ncil of Buenos Aires, 1918–20, sat in the chamber of deputies, o–24 and was minister of public works, 1925–28. Following split of the Radical party, he joined the Anti-Personalist ion led by former President Alvear, under whom he held a net post.

e was finance minister in the Justo cabinet from 1935 to 7, when he was elected president of Argentina. He embarked country upon a policy of democracy and a continuation of riendship with the United States.

wing to ill health and threatening blindness, Dr. Ortiz temarily gave up his duties of office in July 1940 and resigned n the presidency June 1942. Even while ill, Ortiz expressed support for the United States and its allies, while the regime his successor, Ramón Castillo, was mildly anti-American and iously avoided offending the axis powers. Dr. Ortiz died in nos Aires, July 15.

eopathy.

Oct. 3, 1942, marked the 50th anniversary of the beginning of osteopathic education. It was rved in osteopathic colleges, state and local gatherings, at pital openings, with addresses, radio broadcasts and otherwise. n a single class graduating 17 members the educational system grown to six recognized colleges, the total enrolment in which several years averaged nearly 2,000. Of the many thousands luated, more than 10,000 were in practice. The content of courses, as well as in other colleges in the country, was lified as a result of World War II, and calendars were re- nged so that four college years might be covered in three ndar years. But entering classes in the summer and fall of totalled larger than the corresponding 1941 classes, and it the policy of Selective Service to keep such students in ol on the principle that they were in preparation for essential vity.

he number of osteopathic physicians in practice reached an ime high of approximately 10,700, with a larger per cent ever before affiliating with professional organizations, na- al and state, and more than ever before availing themselves pportunities to take postgraduate and review work.

steopathic research was continued and the results published. United States congress which, in a previous year, had ap- riated funds for the payment of osteopathic interns to be inted in army hospitals, in 1942 made an appropriation for payment by the medical corps of the navy of medical officers who were graduates of osteopathic colleges. (R. G. Hu.)

Ostland.

The German name for the northern portion of the "Occupied Eastern Area," including northeastern Poland, White Russia and the former Baltic states of Estonia, Latvia and Lithuania (*qq.v.*) (including the Vilna area, disputed between Poland and Lithuania). Reichsleiter Alfred Rosenberg was appointed reichsminister for the entire area in 1941 (including White Russia and the Ukraine); Heinrich Lohse was Reichscommissar for the Ostland in 1941–42, with headquarters in Riga. (F. D. S.)

Ottawa.

The capital of the Dominion of Canada (*q.v.*) and the seat of the supreme court, is situated on the right bank of the Ottawa river near the mouth of the Rideau, both rivers having very beautiful falls. The city itself is divided into an upper and a lower town by the Rideau canal. The parliament buildings are situated on a series of high bluffs which overlook the river, in one direction toward the Chaudière falls and in the opposite direction toward the Rideau falls. The population of the city was 154,951 in 1941.

The gross value of manufactured products in 1941 was $28,582,935.

The city's most important educational institution is the Université d'Ottawa.

Oxford University.

The academic year 1941–42, which began with 2,879 undergraduates in residence, ended with 2,832. The numbers of men matriculating in Hilary (158) and in Trinity (296) terms were again much above the normal figure; they were also slightly above the figures of the previous year. The average age of entry of men had declined since the war began. In 1941–42 58% of the men matriculating were below the age of 18½; in the previous year the percentage was 43.

The system of wartime examinations designed for men who would be called up in the middle of their courses and who wished to start them in bye-terms was maintained. The new regulations, which would normally restrict women's courses to two years, would make these examinations attract most of the women. In consequence, Pass Moderations was abolished for the period of the war.

A standing committee of scientists with some lay members was appointed to advise on technical problems of all kinds connected with the erection, maintenance and use of university buildings.

Benefactions received during the year included £1,320 a year for 10 years from the Nuffield provincial hospitals trust for the establishment of a professorship of social medicine, the holder of which would work in an institute to be established by the trust at a cost of upwards of £8,600 a year; and £3,000 a year for 10 years from the Rockefeller Foundation for research into problems of human nutrition.

In Oct. 1942 the numbers of matriculations were 887 men and 283 women. (D. V.)

*Canton and Enderbury Islands, in the Phoenix group, are shared with the U.S.A. under the Anglo-American pact, Aug. 10, 1938.
†New Hebrides adhered to the Fighting French cause of General de Gaulle in 1940.

of 1941, war spread rapidly to the British Pacific islands and mandated territories. The Gilbert and Ellice islands, New Britain, the Solomon islands, the Bismarck archipelago, and New Guinea were raided, attacked and partially occupied by Japan early in 1942.

Heavy counter blows were struck by the United Nations and there was bitter fighting in New Guinea and the Solomons (*see* World War II).

In the Fiji islands, which for purposes of defense came under the South Pacific command as distinct from the S.W. Pacific command, there was an enormous increase in the military and para-military activities by the peoples of all races. The garrison was heavily re-inforced, and compulsory measures were introduced in the defense force, the home guard and the civil defense service. Various boards and committees controlled such aspects of the war effort as imports, exports, foreign exchange, production and marketing, works, transport and communications, rents, and the organization of labour. A man-power board was appointed, and the call for an all-out war effort was strongly emphasized by Major General Sir Philip Mitchell, the new governor and high commissioner for the South Pacific, at his first legislative council on Aug. 1, 1942, and also at the Annual Council of Chiefs on Sept. 16. There were drastic cuts in petrol and oil consumption, and special efforts were made to provide land for food production with the goal of self-sufficiency.

Since the early months of the war, when sugar production and gold mining prospered while the principal industry of Fiji, copra, declined, a reversal had taken place by 1942. The price of the latter commodity had risen from £5 to £15 a ton, and the entire future production of both the Fiji islands and the Tonga islands was already earmarked. The export of bat guano to New Zealand proved successful during 1942.

Legislation following rapid development of the lab department created in 1940 deavoured to raise the stand of living and regulate the ho of work on the various estat while the health services of islands were further increas A new centre at Nausori opened on Sept. 19, 1942; tr elling child welfare clin served the whole Suva pen sula, and further mobile un were being added.

For the first half of 19 revenue amounted to £505,3 and expenditure to £454,8 War taxation realized £26,9 and defense expenditure talled £60,564.

cifism.

As was the case in World War I, the so-called historic peace churches—the Society of Friends akers), the Church of the Brethren (Dunkards) and the nnonites—took a leading part in the activities of pacifists in United States, *i.e.,* those persons who on grounds of con- nce refuse to participate in any war. The combined member- of these sects in 1942 was approximately 400,000. Emphasis the right of the individual to follow his own conscience or leading of the Holy Spirit is even more fundamental with n, however, than opposition to war. A considerable number their members of military age accordingly enlisted or sub- ted to military service under the Selective Service act.

he historic peace churches were joined by the Fellowship of onciliation, the leading interdenominational religious pacifist anization, which includes in its membership many leading rchmen of all denominations, the World Peace Commission he Methodist Church, the Church of the Disciples, the Com- tee on Conscientious Objectors of the Federal Council of rches of Christ in America, and the Association of Catholic nscientious Objectors, in establishing the National Service rd for Religious Objectors which was recognized by the ective Service administration and the department of justice the agency representing conscientious objectors. Under the eral auspices of this board the Selective Service administra- n entered into an arrangement whereby the historic peace rches and the Association of Catholic Conscientious Objectors blished Civilian Public Service camps in which men recognized sincere conscientious objectors performed alternative service. estry, soil conservation, reclamation of rural slums and pre- tion and fighting of forest fires were the commonest forms of work. An increasing number of C.O.s were on "detached service" from camp working in hospitals, reform schools, training courses for postwar reconstruction, and various forms of research. The federal government provided camps and camp equipment and tools but the C.O.s received no pay and the entire cost of the administration of the camps and the maintenance of the workers was borne either by the C.O.s themselves or by churches or pacifist organizations. So far as most of these men and groups were concerned, this arrangement was a voluntary one entered into because they desired to give evidence of their willingness to serve the nation in such ways as conscience permitted. At the close of 1942, there were over 5,000 men in the 72 Civilian Public Service camps representing 115 denominations and religious groups. By adding the sum paid for maintenance and wages for these men at soldiers' pay (though many were doing highly expert work) it was computed that they were contributing service at the rate of nearly $6,000,000 per year. In addition to these men on civilian service at least an equal number of C.O.s accepted noncombatant service in the armed forces.

At the close of 1942 more than 300 conscientious objectors were in federal prisons. These included "absolutists" who refused even to register and men who were adjudged not sincere or on technical grounds not entitled to C.O. classification and who refused induction into the army. The total became nearly 800 if members of Jehovah's Witnesses who claimed to be ministers of religion and therefore entitled to complete exemption were included.

There was no way of computing the total number of pacifists in the United States in 1942. In most of the leading Protestant denominations there had, however, been a great increase after World War I. It was estimated that in that war not more than 100 Protestant ministers outside the peace churches maintained an unequivocal pacifist position. During the summer of 1942 more than 1,600 signed a public statement reaffirming their religious pacifism.

The peace churches and religious pacifist groups abhorred sabotage or obstruction of officials, civilians or soldiers in the performance of what they regard as their duty; but insisted upon their own right to proclaim their religious faith and to win converts to it. The government did not interfere with their activities. In the churches mutual respect and friendly relations between nonpacifists and pacifists, for the most part, prevailed.

Very few American pacifists were anarchists, nonresistants of the Tolstoyan type, or isolationists. There was much discussion, therefore, in pacifist circles of peace aims and postwar reconstruction. The great majority believed there must be some form of federal world government along the lines of the American union. They joined with other churchmen in the work of the Commission on the Bases of a Just and Durable Peace of the Federal Council of Churches of Christ in America. Many pacifists, however, believed that continuation of the war would lead to catastrophe and that the United States government should offer to make peace immediately with all peoples prepared to join in establishing a world order based on freedom and equality for all peoples, as the surest way of breaking the hold of totalitarianism in axis lands.

The upsurge of the nonviolent movement for Indian independence under the leadership of Gandhi served as a considerable stimulus to pacifism in the United States, and Gandhi was generally regarded as the world's leading exemplar of the pacifist philosophy and technique.

Except for minor differences, the picture of pacifism, including the treatment by the government, was the same in Great Britain and other English-speaking countries. Except in these lands and a few in Latin America, the rights of conscientious objectors were not recognized though there were small pacifist groups, Quakers and others, in nearly all countries. (*See* also RELIGION.)

Packard, Frank Lucius (1877–1942), Canadian-U.S. author, was born Feb. 2 in Montreal, Que., of U.S. parents. He was graduated from McGill university in 1897 and then worked as an engineer in the United States. In 1917, he wrote an adventure thriller, *The Adventures of Jimmie Dale,* which proved so popular that he continued the series. The Jimmie Dale books sold about 3,000,000 copies and were widely translated. Another of his best-sellers, *The Miracle Man,* was produced on the stage and in motion pictures. Packard died in Lachine, Que., Feb. 17.

Padilla, Ezequiel (1890–), Mexican statesman, was born Dec. 31 in Coyuca de Catalan, Mexico. He studied law in Mexico and abroad and was law professor at the University of Mexico, 1926. He served three terms as federal deputy and was twice a senator. He was also attorney general of the republic, 1928, secretary of public education, 1929, and minister to Hungary and Italy, 1930–32. When Avila Camacho was elected president in 1940, he made Padilla his foreign minister. A skilled diplomat, he was frankly anti-axis and made a strong appeal for hemispheric solidarity in a speech before the Mexican senate in March 1941. He denounced Hitler's invasion of Russia and took vigorous measures to eliminate axis influence in Mexico by ousting diplomats, jailing potential fifth columnists, controlling the movements of axis nationals and exchanging information with the United States on security measures. Four hours after the Japanese attack on Pearl Harbor, Mexico severed diplomatic relations with Tokyo. After the axis po ignored Padilla's protest against the sinking of a Mexican by a U-boat, the Mexican chamber of deputies declared wa Germany, Italy and Japan on May 29, 1942.

Painting. The younger generation of artists was seriou drained in 1942 in the U.S. by service in the ar forces. Many also of the middle generations temporarily ab doned active production for war work. Much of the patronag private as well as governmental—was diverted to other cau Federal art projects and WPA undertakings were obviously of the question. Nevertheless, the new world-outlook nece tated by the nature of the war and the U.S. position in it brou a vital, contributory influence to bear. Regionalism, which already been losing emphasis in face of the immigration of cr tive workers from Europe, in 1942 took a place of defini negligible import. The interest in western hemisphere art gra ally lost its exaggerated, propagandist highlights, to retai merited, if considerably modified, esteem. European artists had, at first, found considerable difficulty in acclimatizing th selves, began to produce fresh and even provocative work an the same time to attract public attention and that of the youn American painters to these new aspects of their pictorial resea

Another development evident in American painting in 1 somewhat similar in character to growing recognition of the va of international research, was a tendency to break down barr within the nation itself. We find the work of painters on Pacific coast, in the southwest and in the Gulf states no lon unfamiliar to their fellow artists on the eastern seaboard. marked diminution of provincial bias was evident in large me politan centres such as Washington, Chicago and New Y This was undoubtedly one of the major consequences of rec experiments in government—particularly federal patronage. other was the progressive decay of racial lines and the grow liberalism in the recognition of Negro painters which marked year 1942, especially in New York, where the important Ne exhibitions were held, and a major prize won by a Negro ar in the *Artists for Victory* exhibition at the Metropolitan Muse of Art.

Probably the major public gesture of encouragement to Am ican painting in 1942 was the vast *Artists for Victory* exhibit held at the Metropolitan Museum of Art in New York. $53, in purchase prizes were distributed: between 12,000 and 14, paintings, prints and sculptures were submitted. It was one the largest reviews of modern art ever held in the U.S. while there were few newcomers among the winners, the f distribution of prizes further illustrated the growing liberality initial approach, for work of such "abstractionists" as Lyo Feininger, Charles Howard and Kurt Roesch shared the hono with a regionalist such as John Steuart Curry, with fantas such as Atherton and Peter Blume and an expressionist such Jack Levine.

Among the older artists, Max Weber and John Marin b continued to produce work of even quality—each in his pers vein. Marin in his oils showed a further gain in the mastery his medium. His new seascapes betrayed no compromise in pression and apparent spontaneity; yet a definite increase compositional strength and in clarity was recognizable with an dent enrichment of local detail. And while his greater inte had clearly gone into the perfection of his expression in oils, water-colours still offered his characteristic freshness and in viduality of idiom. Weber, in his 1942 exhibited works, offe no novelty in subject matter or treatment; yet he remained tainly the leading American painter in his sensitive handling the brush and his harmonic inter-play of surface-quality

LKS TOPOLSKI, Polish refugee artist, at work in his London studio, on a h of Churchill

AR KOKOSCHKA, Czech artist whose works had been branded as degen- by the nazis in 1939, finishing a still-life of flowers in his studio in London

LUCETTE HEUSEUX, one of Belgium's leading painters, escaped to t Britain after the Belgian surrender in 1940. She is shown finishing a at her small studio in Hampstead

A. VAN ANROOY, official war artist of the Netherlands, was generally considered the dean of United Nations artists-in-exile in Great Britain in 1942

JEAN OBERLE, Free French artist in London. London by 1942 had become the mecca of refugee artists from the continent

space and volume suggestion.

The painter who enjoyed the widest and most consistent re nition of the prize-juries during 1942 was Ivan Le Lorraine bright of Chicago. His large canvas, "That Which I Should H Done I Did Not Do," which was given the first medal awar the Metropolitan Museum of Art *Artists for Victory*, had ready won two earlier prizes during 1942 as well as the Ha Silver medal $500 award at the Chicago Art institute annual hibition in the autumn of 1941. Although Albright was a na American trained entirely in the United States, his work off a distinct resemblance to certain Central European "magic-r ists" of the 1920s, such as Otto Dix, in its expressionist emph on a precise rendering of emotive representational de Strangely enough, another painter who enjoyed recognition ing the year second only to that of Albright—Marsden Hartle also offered a clear suggestion of the Germanic influences. while Albright's "magic-realism" recalls post-1918 German w Hartley appears to have inclined rather toward the Die Bri group in his sympathies. And undoubtedly in Hartley's case, like Albright's, there has been a direct influence fostered by extended visit to Germany when the Die Brücke movement enjoying its fullest attention.

But while the year 1942 was particularly kind to Hartley Albright, both had already considerable recognition in the p Milton Avery, on the other hand, with his 1942 work, may said to have come into his own for the first time. Among fellow painters and a certain small group of critics, Avery's w had been admired for its sensibility and delicate colour-relati But the characteristic understatement of Avery's expression apparently prevented him from catching the public's eye, in s of regular appearances both in group exhibitions and in one- shows. In 1942, however, the clarity of structural organiza and the fresh quality of his palette, evident in a group of la paintings exhibited at the Valentine gallery, seemed to ca wider attention to the subtleties of his expression, and for first time Avery was accorded a recognition long his due.

Among the portraitists, Franklin Watkins' work continued reveal the sitter's personality with an incisive brilliance, and the same time make no compromise in pictorial organizat Portraits such as "Thomas Raeburn White," "R. Sturgis In soll," or "Miss Rosemary Thompson" preserve all the interes human documents without sacrificing any of their pictorial tegrity.

Three other well known younger men—Henry Varnum P Yasuo Kuniyoshi and Julian Levi—continued to produce w comparable with their best of former years. In fact, cert water-colours and oil sketches by Poor of the seacoast of C fornia, near Monterey, surpassed anything he had hitherto d both in spontaneity and freshness of formal vision; Kuniyos retrospective exhibition of the spring showed his right to be garded as one of the most individual, most sensitive and su technicians among American artists; and Julian Levi's portr and his space treatment in landscapes merited an equally h regard for his work.

In quite a different vein, Burchfield and Hopper also ma tained the level of their previous achievement. Burchfield's cent work showed a freshening of colour and a lightening of melodramatic, haunted effects; while in Hopper's, an ad sharpness of contour and an increased coldness of illuminat gave a new, sardonic eeriness to his atmospheric treatment.

Of a still younger group, the most noticed was perhaps J

AN ORDER TO PAINT only war subjects after Dec. 7, 1941, for hangin army camps, was issued to artists of the Federal Art project in Los Ang Calif. Hundreds of requests were received and filled by the artists in 19 Douglas MacArthur was the favourite subject

/ASION," one of a series of paintings by Thomas Hart Benton, inspired by attack on Pearl Harbor. The paintings were criticized in some quarters ng 1942 as too gruesome in their presentation of axis horrors

ine, whose "String Quartet" was given the first purchase prize he *Artists for Victory* exhibition. Among the abstract paint- I. Rice Pereira's work showed a steady advance in refine- t of her detail and in the strength of her structural organiza- . Morris Graves, who attracted so much attention in 1941 his mystical fantasies, disclosed an ability to blend this e of work with a solid structural emphasis derived from an oration of essentially formal interests.

ananiah Harari, formerly best known as an "abstract" painter distinct individuality, showed himself during 1942 an even e stimulating creator of fantasies in the general vein of sur- ist collage, an apposition of surprising representational elements contrasting textures. Another gifted fantasist in the collage l was Georgy Kepes, a Hungarian, former instructor at the haus in Dessau and in 1942 residing in Chicago. Quirt and aham Rattner, both prolific but uneven workers, continued to duce lively compositions; Guglielmo preserved a definite in- duality in his crisp, chilly dream concepts; while Joseph Cor- 's objects, on a vague hinterland of collage, remained prob- the most consistently individual native, surrealist expressions.

the abstract field, Criss and Stuart Davis held the forefront he field of brilliant colour composition, the former having mitted one of the most striking non-prize winners to the ropolitan museum exhibition. Of those who exhibited an- lly with the American Abstract Artists, Fritz Glarner, a Swiss king somewhat after the manner of Vordemberghe-Gildewart, ained with I. Rice Pereira the most stimulating. Balcomb ene, Slobodkina, Bolotowsky and Pollock during the year also wed interesting progress.

f the European artists in the United States, the most strik- new achievements were possibly those of Mondrian, Léger, st and Lipchitz. Mondrian in his latest work completely ndoned the dominant black structure lines so long character- of his work. A harmonic relationship of right-angle forms flat colour-areas still made the basis of his expression. The omatic elements were now restricted to primary colours and s on a white ground. Nevertheless, a greater freedom in the thms of their disposition brought his new pictures in general it much closer to his style of 1917 and 1918 than to more nt painting. A youthful freshness joined his scrupulous crafts- ship, to place his 1942 canvases among his finest work.

éger, likewise, seemed to have found a new youthfulness and ur in a series of large canvases painted in the late spring. st, in his exhibition and in a group showing of surrealist work, tinued his extremely personal marriage of cubist texture in- sts with surrealist portmanteau images; while Lipchitz in his line-and-wash studies and bronzes, conveyed the most complete sense of ease and assurance in his new surroundings.

Among the other European leaders, Chagall, Masson and Tanguy showed a slowly growing confidence, while such Hispanic Americans as Malta and Tamayo undoubtedly produced their most striking work during 1942. (*See* also SCULPTURE.)

(J. J. Sw.)

Paints and Varnishes.

Indications were that United States sales of paints in 1942 would be from 5% to 10% under the record year of 1941. This loss was shared approximately equally by industrial and trade sales. Production of protective coatings required for the war effort, of course, received first consideration. Specifications covering many new items were developed. Of particular interest were materials such as flameproofing products for military fabrics, emulsifiable camouflage paints and mildew-resisting compounds for use on many types of military equipment. Many paints combined colouration, flame retardation, protection, camouflage and mildew resistance in one product.

Various raw material restrictions required for effective prosecution of the war affected the formulation of military paints, as well as civilian paints. The most critical materials, such as imported drying oils and synthetic resins of phthalic anhydride or phenolic type, were most seriously curtailed and, in many cases, were available only for certain types of military needs.

The higher grade solvents, such as coal tar and aromatic petroleum hydrocarbons, were definitely short of demand. Lacquer solvents, either ester or alcohol type, were similarly affected. New chemical types of lacquer solvents called "nitroparaffins" were brought into commercial production and had high promise due to their good solvency and mild odour.

The year 1942 saw little change in the way of pigment problems. Availability, in general, was good. Anticipated shortages of titanium oxide did not materialize due to minor requirements of this material in military equipment. Development of chrome ore deposits in the U.S. brought about complete relaxation of all restriction orders on the important chrome pigments, such as orange and yellow.

In the field of civilian goods, emulsion paints continued to gain in popularity due perhaps to their versatility and ease of application. In general, household varnishes and enamels became slower drying through various restriction orders. Considerable discussion was held within the industry with regard to methods of conserving linseed oil in house paints due to anticipated shortages. A few new governmental exterior paint specifications appeared, calling for oil conservation. In general, it was felt these wartime paints would have excellent durability.

One of the major problems faced by the industry during 1942 was that of containers. The use of metal packages was curtailed with consequent greater increase in the use of glass bottles and the part fibre container. (A. B. Ho.)

Palaeontology.

In the United States the appearance of volume II on the Proboscidae by Henry Fairfield Osborn completed this monumental work which gives the results of over a quarter of a century of labour on the part of the author. It deals with the Stegodontoidea and Elephantoidea. In early chapters it lists much factual data and gives the author's opinions on morphologic terminology, philosophic concepts as well as a discussion of the affinities and migration of the Proboscidae. The bulk of the text is devoted to an unusually complete detailed treatment of the group arranged systematically. The volume is rich in illustrative material. Richard S. Lull and Nelda E. Wright published a monographic study on the hadrosaurian dinosaurs of North America. Based on all known specimens it enabled them to describe the complete osteology, followed by a taxonomic revision of the known genera and species.

C. L. Camp described two new genera of mosasaurian reptiles from the Upper Cretaceous of California. These specimens are noteworthy as being the first representatives of this group to be found in the state. Robert W. Wilson described a fauna found in Rampart cave in Arizona. In this dry cave bones and dung of the extinct sloth *Nothrotherium* were found intermingled with the skeletal remains of living animals thus apparently indicating their post-Pleistocene age. A short paper by Richard S. Lull described new fossil tracks from the Permian of Wyoming. Bryan Patterson published a paper characterizing a new genus and species of giant bird from the Oligocene deposits of Patagonia. In Norway, Carl Wyman and Ivar Hessland published a paper on recently discovered remains of the Garfowl (*Alca impennis L.*). In Scotland Dr. T. Westold described the skeletal structure of the two Permian fishes *Dorypterus* and *Lekanichthys*.

In invertebrate palaeontology, Lloyd W. Stephenson published a monographic study of the larger fossils comprising the fauna of the Navarro group of Texas. The classification, distribution and range of these fossils are discussed and all of the forms are systematically described. In all about 296 varieties and species are described as new.

Doctors Edward Oscar Ulrich, August F. Foerste, A. K. Miller and W. N. Furnish issued a joint report on the Nautilicones of the Ozarkian and Canadian faunas of the United States. Altogether 75 species belonging to 17 genera are systematically discussed, of which 7 genera and 40 species are described as new.

A paper by Charles E. Resser names nearly 200 new species of Upper Cambrian trilobites. It is the purpose of this paper to improve the concept of known genera and to supply species for more exact stratigraphic work.

In palaeobotany the publication by R. Thiessen and G. C. Sprunk of "Coal Paleobotany," records the progress made in the study of Carboniferous floras in the United States. A paper by H. P. Hansen gives the results of studies by pollen analyses of Pleistocene and recent peat deposits in Oregon and Washington. A paper by H. D. MacGinitie describes an Eocene flora from Chalk Bluffs, Calif. Erling Dorf published a review of the important flora of the Lance formation at the type locality.

Palestine. Palestine lies on the western edge of Asia and is bounded on the west by the Mediterranean, on the southwest by Egypt, on the south by the gulf of 'Aqaba, on the east by Trans-Jordan, on the northeast by Syria and on the north by Lebanon. Area 10,100 sq.mi.; pop. (est. Dec. 31, 1940) 1,545,000.

Chief towns: (pop. est. 1939): Jerusalem (cap. 129,800); Haifa (104,800); Jaffa (77,400); Tel-Aviv (130,300). Hig Commissioner (1942): Sir H. A. MacMichael, K.C.M.G., D.S.O languages: English, Arabic, Hebrew; religions: (1939) Mohammedan 848,933; Jewish 424,373; Christian 114,624.

History.—The preoccupations of the government and people Palestine in 1942 were symbolized by the appointment of a controller of man power and a food controller. Enrolments in the British armed forces and women's services amounted on July to just over 20,000—nearly 14,000 Jews and over 6,000 Arab There were also 20,000 Jews in various formations of auxiliar police. The responsible Jewish organizations worked both for i creased enlistment in existing conditions and for the acceptance by the British government of a separate Jewish fighting forc In June they appealed to all members of the community betwee the ages of 20 and 30, if they were unmarried or married an childless, to volunteer for combatant or women's service; an considerable social pressure, amounting at times to dismissal fro employment, was brought to bear on the unwilling. On Aug. 6 th secretary of state for war made an announcement which partial satisfied the Zionist demand for a distinct Jewish force; a Pale tine regiment, consisting of separate Jewish and Arab infantr battalions, would be created at once for service in the Midd East. The numbers in the Jewish battalions, however, would fa considerably short of the 32,000 combatants which the Jewis Agency proclaimed its ability to raise, still more of the 200,00 Jews from Palestine and elsewhere promised to the United N tions by the American Committee for a Jewish Army.

Palestine's numerous small factories and workshops, mostly i Jewish ownership, produced increasing quantities of miscellaneo manufactured goods for the army. Agricultural production, apa from citriculture, also increased, and unemployment was pract cally eliminated. The citrus farmers, whose 1941–42 crop w estimated at the low figure of 6,000,000 cases and who were ab to export only small quantities to neighbouring countries, we again given relief by the government. Loans for the 1942–43 se son were promised up to a total of £P.650,000, and it was stat that the government was trying to devise for subsequent years form of assistance which would not add to the farmers' burd of debt.

The possibility of food shortage, after the poor Middle Easte harvests of 1941, gave rise to anxiety in the early months of th year, and the cost of living continued to rise, more steeply in th Arab than in the Jewish districts. Substantial quantities of gra were imported on government account to close the gap betwe the harvests of 1941 and 1942. The latter was unusually abu dant, and the government took steps to ensure that it should n slip into the hands of hoarders and speculators, by assuming monopoly of the purchase from cultivators of wheat, barley, maiz durra and sesame, and by requisitioning the whole of these cro above the needs of the agricultural population for food and see The prices of grain and flour were also controlled, the latter bei kept down by a subsidy. Sugar and certain other commoditi were rationed.

The interruption of communications over an increasingly wi area made Jewish immigration into Palestine more and more d ficult. The number of permits issued since the *White Paper* 1939 exceeded the number of arrivals, but small numbers of ce tificates were still granted, amounting to 3,750 between Oct. 1941 and Sept. 30, 1942. (The dependents of certificate-holde would be additional to this figure.) The government continued apply its declared policy against unauthorized immigration, whi also declined in volume. On Feb. 24 the "Struma," a sm vessel which had left Constanza with 769 Jewish refugees board, was sunk in the Black Sea after being turned back by t Turkish authorities on the Palestine government's intimation th

:s passengers would not be allowed to land. There were only two
urvivors, and the episode caused intense indignation among the
ews of Palestine and elsewhere. Jewish bodies in the United
tates appealed to the State Department to ask the British gov-
rnment to modify its immigration policy in Palestine.

There was little political activity in the Arab community, but
nternal Zionist politics were lively, and dissensions in the world
adership of the movement were reported from the United States.
ı Palestine, the first elections since 1933 to a conference of the
eneral Federation of Jewish Labour (Histadruth) showed that,
though the Labour party retained its dominant position, one of
ie left-wing organizations (Hashomer Hatzair) had increased its
rength. Dr. Judah Magnes aroused vehement opposition by an
ticle in which he advocated the incorporation of a bi-national
alestine in a Semitic federation and attacked 'maximalist aspi-
tions' for either a Jewish or an Arab state. He subsequently
ganized a movement, known as Ichud (Union), to press this
oint of view. At the other extreme, a small terroristic group
hich had seceded from the illegal military formation of the Re-
sionists committed a series of outrages against the police. These
ts, which were deplored by the responsible Jewish leaders, caused
x deaths. The leader of the gang, Abraham Stern, was captured
the police and killed while trying to escape. (H. By.)

Education.—(1939–40): Arab public system maintained by government,
2 schools (12 with secondary sections), 54,367 scholars; Moslem schools,
ivate 178 (2 with secondary sections) with 14,204 scholars; Jewish public
ools (1940) 419 (including 6 training colleges and 18 secondary, 5 trade
d vocational schools) with 56,900 scholars; Jewish private schools 320
ıcluding 22 secondary schools and 2 training colleges) with 25,700
olars; Christian schools 195 with 25,274 scholars; Hebrew university,
rusalem, 130 teachers, 1,106 students.

Banking and Finance.—Revenue and expenditure (actual 1940–41) revenue
.8,441,899; expenditure £P.7,633,661; (1941–42) revenue est. £P.7,450,-
5; expenditure est. £P.9,105,532; public debt (March 31, 1941) £P.4,-
5,000; notes in circulation (April 30, 1942) £P.14,900,000; exchange
te £P.1=£1 sterling=approx. $4.03 in 1942.

Trade and Communication.—Overseas trade (merchandise): (1941) im-
rts £P.12,038,000; exports £P.1,362,000; (1940) imports £P.11,035,454;
ports, domestic £P.2,114,584; re-exports £P.176,195. Communications
d transport: roads (1939) all weather 1,451 mi.; seasonable 985 mi.;
ilways (1940) broad gauge 333 mi.; narrow (Hedjaz Rly.) 271 mi.;
ways (1938): passengers 600, mail 86.9 tons; shipping (1939) entered
57 vessels; 4,370,085 net tons (Dec. 31, 1940). Motor vehicles licensed:
62 private cars, 1,198 public cars, 936 buses; 3,180 trucks and vans,
31 cycles; 20 tractors; wireless receiving set licenses (1938) 35,708;
ephone subscribers (1940), 10,716.

Agriculture and Minerals.—Production 1939 (in metric tons): potash (ex-
rts) £P.381,162; citrus fruits (exports) £P.3,807,570; barley (1940)
3,000; wheat (1940) 136,000; olive oil (1940) 3,600; wine (1938)
,000 hectolitres; maize 6,200; tobacco (1940) 1,000; potatoes 10,400;
amum 3,800.

anama. The most southerly Central American republic. It
is bisected by the Canal Zone, leased to the United
ates. Area, 32,933 sq.mi. Pop. (census of 1940): 631,637 ex-
usive of the Canal Zone (1940 census: 51,827). Of this num-
r, 64,960 were Indians. Capital, Panama city (111,897); other
ies are: Colón (44,395); David (9,222); Chitré (4,790). Presi-
nt in 1942: Dr. Ricardo Adolfo de la Guardia.

History.—The administration of Pres. de la Guardia, which
d come into power late in 1941 on a program friendly to the
nited States and the allies, entered actively into the work of
mination of axis activity in an area so vital to American de-
nse. Civilian defense organizations of all types were established,
d the republic planned the formation of an army of at least
000 men. An agreement was worked out in May 1942 which
rned over to the United States land needed for military projects,
d which granted to Panama certain railroad lands, waterworks,
d sewage systems, also the liquidation of an indebtedness of
,700,000, the Panama share in the cost of construction of the
o Hato-Chorrera military highway. Japanese merchants were
ohibited from doing business in the republic, and travel by
ens was rigidly supervised. Spain's chargé d'affaires, Count
rlos de Bailen, was expelled.

U.S. "BUSHMASTER" jungle troops constructing a camp in Panama in 1942

Panama, with imports of tremendous importance in her economy, felt the effects of shortages in shipping facilities early in 1942. Government control of tires and autos took place in February, with typewriter stocks and other items taken over in succeeding months. For a week in Aug. 1942 no bread was available, and flour had to be shipped in from the Canal Zone. Scarcity in other articles resulted in rigid price control. Inter-American projects for the production of strategic materials included plantings of abacá and rubber in the republic.

Education.—The school system of the republic included more than 600 primary schools and a number of secondary schools. Expenditures for 1941 were $2,513,000.

Defense.—The peacetime national police force of 3,000 men was being rapidly augmented in 1942 toward a goal of an army of 5,000, supplemented by a volunteer national militia.

Finance.—The monetary unit is the balboa, in value equal to the U.S. dollar. In 1941, government revenue amounted to $17,621,000; expenditures were $18,146,000. A bond issue of $500,000 was authorized during 1942.

Trade.—Figures at hand for trade show, for 1941, exports: $4,283,145; imports: $32,507,755. The United States normally takes 90–95% of Panama's exports, and supplied (1941) 80% of imports. Main items of export: bananas, cacao beans, beef, coconuts, gold and forest products. Imports are largely machinery and vehicles, other manufactured goods and foodstuffs. Tourist trade, always important in Panama, was eliminated by the war.

Communication.—Panama had 257 mi. of railway in 1942,

CHILDREN playing outside one of the air-raid shelters for civilian inhabitants constructed in the Panama Canal Zone in 1942 and at least 750 mi. of highway, including the transisthmian defense road, reported near completion during the year. The U.S. allotted $3,675,000 for defense highway plans in Panama. One new airline service with Costa Rica was established in 1942. (*See* also CENTRAL AMERICA; HISPANIC AMERICA AND WORLD WAR II.)

Pan American Union.

The Pan American union is an international organization created in 1890 at the First International Conference of American States and maintained by the 21 American republics to promote peace, commerce and friendship among the republics. The union is supported by annual contributions from member countries in amounts proportional to population. It is controlled by a governing board composed of the secretary of state of the United States, who is chairman, and the diplomatic representatives in Washington of the other republics. Headquarters: Washington, D.C.; director general in 1942, Dr. L. S. Rowe; assistant director, Dr. Pedro de Alba.

The Pan American union serves as the permanent secretariat of the International Conferences of American States and organizes many of the technical inter-American conferences convened to consider specific subjects. The union is also a centre of information on the American republics and on inter-American relations.

During 1942, in addition to its regular activities, the Pan American union was especially active in dealing with the problems arising out of the extension of World War II to the American continent. At the beginning of the year, and on the initiative of the governments of Chile and the United States, the governing board of the Pan American union convened the third meeting of ministers of foreign affairs of the American republics which met at Rio de Janeiro Jan. 15–28, 1942. That conference recommended the severance of diplomatic and commercial relations by the American republics with the aggressor nations and adopted a series of other conclusions designed to promote the security of the western hemisphere.

Pursuant to a recommendation of the Rio de Janeiro meeting, the Pan American union organized the Inter-American Defense board, which held its first meeting in Washington on March 30, 1942. Military, naval and aviation experts of the several republics comprised the board.

An Emergency Advisory Committee for Political Defense composed of seven representatives designated by the governments of Argentina, Brazil, Chile, Mexico, the United States, Uruguay and Venezuela was also set up by the governing board of the Pan American union in April, and established its headquarters in Montevideo. This committee was organized to control subversive activities in the American republics. Closely related to this committee was the Inter-American Conference of Police and Judicial authorities which met at Buenos Aires from May 27 to June 9, 1942.

The Inter-American Financial and Economic Advisory committee organized at the Pan American union in 1939 to consider the economic and financial consequences of the war, set up during 1942 an Inter-American Maritime Technical committee to carry into effect a plan for the use of immobilized ships lying in the ports of the American republics. The committee al organized a special Conference on Systems of Financial and Ec nomic Control to regulate economic intercourse between the wes ern hemisphere and the aggressor nations, which met at the P American union from June 30 to July 10, 1942.

In Oct. 1942 the Pan American union received from the Inte American Juridical committee of Rio de Janeiro a Prelimina Study on Post War Problems, copies of which were forwarded the member states for observation and comment. An Executi Committee on Post War Problems was also appointed by th governing board. (*See* HISPANIC AMERICA AND WORLD WAR II)

(L. S. Ro).

Paper and Pulp Industry.

In 1942 the paper and pu industry found itself in th middle of a war economy. With steel, tin, aluminum and oth materials diverted almost entirely to armaments many produc heretofore made of these materials found paper and paperboa as substitutes. In the packaging of foods alone the requiremen of paper products had to meet tremendous demands. On th other hand the industry had to meet large losses through pap curtailment of other industries such as the automobile, refriger tor, radio, etc. whose reduced requirements were reflected paper and paperboard production. In all branches of busine great accomplishments were made in reducing paper requir ments.

In Nov. 1942 the industry in the east found itself cut off fro most of the wood pulp production of the Pacific coast becau of the pulpwood, labour and transportation problems of th region. Three mills were closed completely and the products the others were diverted to nitrocellulose, rayon and lend-lea commitments. Rayon pulp requirements increased from 72,00

SERIOUS PAPER SHORTAGE occurred in the U.S. during 1942. Partially onsible for the adequate supply were the waste-paper salvage campaigns ucted by U.S. school children

s in 1930 to 287,500 tons in 1941. Nitrocellulose as an outlet a new and large user of wood pulp, it having previously n made from cotton. Because of steel and other priorities new mills were built in 1942.

Canada.—In 1941 the Canadian industry surpassed the record hade in 1940. One hundred six mills operated in 1941, an in- ase of three over 1940. Production was increased in all nches of the industry. One newsprint mill was closed in 1942 onserve on power and labour.

United Kingdom.—No statistics were available to show paper duction in Great Britain after the war began. Having depended largely on Scandinavian mills for raw materials, considerable adjustment was necessary in operations since only a limited amount of pulp was available from America. Straw and old papers became the major raw materials. There was a critical shortage of rosin and esparto. The government controls eliminated most unessential uses for papers and Great Britain learned how to get along with the quality and quantity of papers produced.

(R. G. M.)

Papua: *see* BRITISH EMPIRE; PACIFIC ISLANDS, BRITISH.

Paraguay. An inland republic in southern South America. Area, 154,165 sq.mi.; pop. (1938 official estimate: 954,848) approximately 1,000,000 in 1942. Capital: Asunción (104,819). Other important cities (with est. pop.) are: Villarrica (36,000); Concepción (11,000); Encarnación (10,000); Paraguarí (10,000). President in 1942: Gen. Higinio Morínigo.

History.—Political discord and uncertainty, accompanied by ironclad censorship and rigorous repression, marked the year 1942 in Paraguay. General Morínigo and the army group which had been his support since his rise to power in 1940, were faced with several abortive revolts. In May the Liberal party, one of the principal opposition groups, was dissolved, and in September the "provisional" term of the president was extended, without an election, for another five years. Late in the year, however, an election was scheduled for January, 1943, with General Morínigo the sole candidate. In an effort to develop agricultural and industrial resources, loans were negotiated with the United States ($3,000,000) and Brazil (approximately $5,000,000, to be received in a six-year period).

Education.—There were nearly 2,000 primary schools in 1941 and a national university at Asunción.

Finance.—The monetary unit is the peso, valued at approximately $\frac{1}{3}$ cent U.S. in 1942 (or 70 to the Argentine peso). In Aug., Paraguay resumed interest service (unpaid since 1932) on its foreign debt (total: approximately £800,000).

Trade and Communication.—In 1940 imports (chiefly textiles, tinplate for canning, foodstuffs and miscellaneous manufactures) totalled 14,832,657 pesos, a 16% rise; exports, 11,385,345 pesos, a 29% decline from 1939. The main exports were quebracho extract, 32,066 tons (22.1% of export values); canned meat, 9,100 tons (15%); yerba maté, 10,092 tons (12.9%); hides, (12.5%); cotton 19,347 bales (11.1%); lumber (6.1%); petit grain oil, 164 tons (4.5%). In 1941, exports of quebracho extract and petit grain oil rose (respectively to 36,574 and 199 tons), while those of yerba maté fell off to 8,863 tons.

External communication is primarily by the Paraguay river to Buenos Aires, by rail to Argentina and by air. In 1942 air service was increased from three to five flights weekly. There were, in 1942, 713 mi. of railway.

Agriculture.—Important crops include sugar (1941 production: 17,474 short tons; 1940: 13,720), coco-nut oil and tung oil. Cattle are raised extensively, with canned meat and meat extracts an important export item.

Manufacturing.—Industry is chiefly textile manufacture, flour milling, and tannin extraction. (C. N. G.)

Parents and Teachers, National Congress of.

The National Congress of Parents and Teachers had a membership of 2,685,041, enrolled in 27,845 parent-teacher associations in the 48 states, the District of Columbia, Hawaii and Puerto Rico, as of April 15, 1942. It was founded in Washington, D.C., in 1897, as the National Congress of Mothers. Membership in Congress parent-teacher associations is open to all persons interested in the education and welfare of children and youth.

Activities relate to education in all its phases, health, family life, juvenile protection, etc. Outstanding projects are the summer round-up of the children, community school lunch program, and traffic safety education project.

A special war program undertaken by all local associations in 1942 included activities in the following fields: morale; health; education; juvenile protection; consumer safeguards; safety; recreation; aid to the men in service; community co-operation and volunteer service; and wartime finance.

The *National Parent-Teacher,* official parent-teacher magazine, is issued ten times a year. The *National Congress Bulletin* is sen monthly from September to June to every local association an to individual subscribers. *Community Life in a Democrac* *Schools for Democracy,* and the annual convention *Proceeding* are important books included among the numerous publication of the organization. The office of the National Congress is a 600 S. Michigan blvd., Chicago, Ill. (V. M. K.)

Paris. Capital and largest city of France, pop. (1936 2,829,746; of greater Paris, including the belt of subur ban factory towns, 4,933,855. Paris ceased temporarily to be th French capital when the government, headed by Premier Pau Reynaud, quit the city under the threat of the German advanc on June 9, 1940. The Germans entered Paris five days late The city continued under German military occupation throughou 1942. The French government organized after the loss of th war under Marshal Henri Philippe Pétain took up residence i Vichy, (*q.v.*), which was outside the original zone of Germa occupation.

Gen. Otto von Stulpnaegel, the German administrator of Paris continued to rule with an iron hand in 1942 and repeatedly re sorted to the shooting of large numbers of hostages for real o alleged attacks on German officers and soldiers. The majorit of Parisians also suffered from shortage of fuel in winter an from chronic undernourishment, the extent of which could b gauged from a report issued in 1942 on French food rations pe week:

Bread 68 oz., meat $6\frac{1}{2}$-9 oz., sugar $4\frac{1}{2}$ oz., fats and oils $3\frac{1}{2}$ oz potatoes (irregular). A card system was introduced for clothing and shoes were doled out very sparingly. An applicant for a ne pair was required to prove that his old shoes were dilapidate beyond repair.

One of the first features of life in Paris that impressed the fe foreign visitors in 1941 and 1942 was the virtual disappearanc of motor vehicles, apart from German military cars and automo biles and trucks engaged in municipal services. The Metro o underground railway continued to function and was often jamme to capacity. Horse-drawn cabs reappeared, although the horses like the human inhabitants of France, suffered from very lea rations.

With all the undernourishment and privations, places of amuse ment continued to function as usual, except when they wer temporarily closed as a punitive measure by the German militar authorities. The Opera and the Opéra Comique gave their usua repertory; concerts took place and theatres, dance halls an moving-picture theatres remained open, although the latter wer handicapped by the shortage of new films.

A minority of wealthy people, speculators and "collaboration ists" who were of service to the Germans in various ways did no suffer from the general restrictions and were able to patroniz such fashionable restaurants as Maxim's, the Lido and the Boeu sur le Toit. The first named of these restaurants, incidentally had been bought up by a famous Berlin restaurant, Horcher's and this was symptomatic of a general tendency both in Paris an in France as a whole.

The Germans had been using the considerable surplus of th huge indemnity imposed on France ostensibly for payment o the costs of the occupation (first set at 400,000,000 francs a day later reduced to 300,000,000 francs) to buy control of most o the leading French industrial and commercial establishments Since the purchases were outwardly legal and not simple acts o expropriation, a very confused situation was created in relatio to many property titles. Renault was producing tanks for th German army and Citroën was making shells, grenades, bomb and army cars for German use. The Potez aeroplane factory a niens was working for the Germans, and it was estimated that ance in 1942 was supplying Germany with motor vehicles at rate of 38,000 annually.

Especially after Pierre Laval became premier in the spring of 42, there was a good deal of pressure on French workers to lunteer for work in Germany. Compliance with German de-nds in this field was represented as a means of obtaining the ease of some of the 1,500,000 French war prisoners still in rman camps.

After the establishment of the Vichy regime, Paris was the onghold of extreme French collaborationists of the type of arcel Déat and Jacques Doriot, an ex-Communist turned scist, who advocated complete French association with Ger-ny, stronger measures against the Jews and outright war inst the Anglo-Saxon powers. These collaborationists con-ntly prodded and reproached Vichy, before the Germans took er the unoccupied zone Nov. 11, 1942, for not going far enough bowing to the German will.

Paris witnessed a good deal of speculation in objects of perma-nt value, such as paintings, rare editions of books, furniture, mps and fine porcelain. Paper francs were viewed with distrust, d a U.S. dollar bill, before the beginning of war between Ger-ny and the United States, could realize 210 francs on the ack bourse," as against an official exchange value of 43.50 ncs. (W. H. Ch.)

rker, John Henry (1866–1942), U.S. army officer, was born Sept. 19 near Tipton, Mo., and duated from the U.S. Military academy in 1892. After serv- on active duty in the Spanish-American War, he went to Fort avenworth, Kan., where he organized the first model machine- detachment in 1903. His efforts to advance the use of the chine gun as an army weapon won recognition in 1904, when army incorporated the "model unit" into the regular army. ring World War I he was attached to General Pershing's staff machine-gun expert and organized the automatic weapons ools at Gondrecourt and at Langres, France. He was wounded ile on active service in France and received the D.S.M., the oix de Guerre and the D.S.C. with three oak leaves for gallan- in action. He was made a colonel in 1920, retired four years er, and in 1941 was made brigadier general, retired, in recogni-n of his services. He died in Reno, Nev., Oct. 13.

rliament, Houses of. The seventh session of the 37th parliament of the United King-m of Great Britain and Northern Ireland was opened by the g, accompanied by the queen, on Nov. 12, 1941. It was again simple ceremony without robes, state procession or prior nouncement.

During the session the strength and composition of the war inet was changed more than once. The number was reduced m nine to eight. Lord Beaverbrook and Arthur Greenwood t the government. Sir Kingsley Wood remained chancellor of exchequer but left the cabinet. Sir Stafford Cripps was ought in as Lord Privy Seal to act as leader of the House of mmons, but in November relinquished his seat in the war inet and became minister of aircraft production. Herbert orrison, the home secretary, entered the war cabinet in his place. iver Lyttelton came back from Cairo to a newly-created cabinet nistry of production. By consent of the Australian government, G. Casey joined the war cabinet at Cairo. This appointment, d the transfer of C. R. Attlee to the Dominions office, while remaining deputy prime minister, associated the dominions more directly with the conduct of the war. (*See* also Cabinet Members.) Later Lord Moyne went to Cairo as assistant minister. A new office, that of minister-resident in West Africa, brought Viscount Swinton into the ministry, and Col. Oliver Stanley succeeded Lord Cranborne as colonial secretary. Captain David Margesson and Lt. Col. John Moore-Brabazon were succeeded as war minister and aircraft production minister by Sir James Grigg and Col. John J. Llewellin respectively. The latter on being succeeded by Cripps went to Washington as minister-resident for supply. Sir Andrew Duncan returned to the ministry of supply and Hugh Dalton was transferred from economic warfare to the board of trade. (*See* also Government Departments and Bureaus.)

House of Commons.—Ten contested by-elections in the period up to Oct. 1942 brought a slight but significant change in party representation. Four seats (Maldon, Grantham, Wallasey and Rugby) were won against Conservative supporters of the government by Independents. One other Conservative seat (Cardiff East) was held for the government, but Sir James Grigg who was elected to it when he became secretary for war stood as the nominee of no party. Five other Conservative seats were successfully retained. Of 13 uncontested by-elections 11 were in Labour seats and the other 2 Conservative. Apart from by-election victories the Independents were increased to 18 during the year by the accession of Leslie Hore-Belisha, Sir Henry Morris-Jones and E. Granville from the National Liberals, Sir Richard Acland from the Liberals, and the withdrawal of the Conservative whip from Captain Alec Cunningham-Reid, who with two Independents formed a short-lived People's party. The regroupings left the Conservatives 354 strong, Labour 170, Liberal Nationals 28, Liberals 18. There were also 6 National Labour, 10 Ulster-Unionists, 5 Nationals and 1 Communist.

Twice the government was challenged on votes of censure in debates on the conduct of the war. In January they had a majority of 464 to 1; in July when the censure motion was moved by Sir John Wardlaw-Milne, a Conservative, the majority was 475 to 25.

House of Lords.—In the government changes Viscount Cranborne was summoned to the peers, taking the courtesy title he had borne as the eldest son of the marquis of Salisbury, to become leader and colonial secretary and later Lord Privy Seal. Viscount Wolmer was similarly raised when he became minister of economic warfare but on his father's death succeeded to the earldom of Selborne. Lord Margesson's was the only new viscounty but on ceasing to be archbishop of Canterbury Dr. Cosmo Gordon Lang was created a baron and other baronies were conferred on four members of the Commons. (L. Du.)

Parseval, August von (1861–1942), German aerostatics expert, was born Feb. 5 in Frankenthal, Germany. After serving in the reichswehr, he retired in 1907 to devote himself to the construction of nonrigid dirigibles. He perfected a captive observation balloon which was employed by the German army during World War I. This lighter-than-air craft, frequently called a "sausage" balloon, played a vital role in directing artillery fire during the war. He also experimented with motor-driven dirigibles. After the war, he became professor at the Berlin Technical academy and was the author of *Count Zeppelin and German Aviation* and *Mechanics of Bird Flight.* He died Feb. 23, according to a German broadcast.

Patents. The quest for inventions of purely military character or of value in the manufacture of materials needful to the armed forces of the United States and its allies continued to be one of the important activities of the patent office in 1942. All of the thousands of applications for patents pending and those received each day were examined by the experts of the office and those found useful for the army or the navy were brought to the notice of the military and naval branches of the government.

Applications filed by nationals of Germany, Italy and Japan and of the countries occupied by them were segregated by the patent office for seizure by the Alien Property custodian. Among these were many covering inventions of helpfulness in the prosecution of the war. In addition, the patent office effectuated public law no. 700 and public law no. 239 prohibiting the sending abroad of information that might come into the possession of the axis. These acts of congress are administered by the Patent Office War Division, under the direction of the commissioner of patents.

Applications filed in the 12 months from Nov. 30, 1941 to Dec. 1, 1942, totalled 51,035, of which 4,518 were for design patents. This recorded a further decrease, compared with the calendar year 1941 and the fiscal year 1940–41. The number of applications for registration of trade marks in the 12 months ended Nov. 30, 1942, was 8,075. There were 6,950 registrations.

Financial receipts of the office from Nov. 30, 1941, to Dec. 1, 1942, were $3,546,176.71. Expenditures in the corresponding period were $4,516,432.07. This was a decrease of $254,660.07 from the outgo in the preceding year. As in 1941, the decline in the number of applications filed, notably by foreign inventors, explained, in large measure, the diminution of revenues. (*See* also INTERNATIONAL LAW; LAW: *Patents.*) (C. P. Co.)

Patrick, Mason Mathews (1863–1942), U.S. army officer, was born Dec. 13 in Lewisburg, W.Va. He was graduated from West Point in 1886. During World War I, he was commandant of the Engineer school, Washington, D.C., 1917. Late in 1917, he was sent to France as chief engineer of lines of communications and director of construction of the A.E.F. In 1918, he was assigned to reorganize the army air force. Though he had no previous aviation experience, Gen. Patrick undertook the task and developed the air force to 45 squadrons by Nov. 1918. He was made first chief of the army air service in 1921, serving in that post until 1927, when he retired. Gen. Patrick died in Washington, D.C., Jan. 29.

Patton, George Smith (1885–), U.S. army officer, was born Nov. 11 in San Gabriel, Calif. He was graduated from West Point, 1909, began his army career as cavalry lieutenant, 1913, and was aide-de-camp to General Pershing in Mexico, 1916–17, and in England, 1917. In France during World War I, he trained at a French tank school in Champlieu and was the first man entered in the U.S. tank corps, Nov. 1917. An expert on mechanized warfare, he was made a tank brigade commander in July 1940. On Oct. 1, 1940, he was promoted to brigadier general, on April 4, 1941, to major general and two weeks later he was made commander of the 2nd armoured division. Soon after Pearl Harbor, he was made corps commander in charge of both the 1st and 2nd armoured divisions, organized the desert training centre at Indio, Calif., where he staged manoeuvres under conditions similar to the fighting in Egypt and Libya. Patton was commanding general of the western task force during the U.S. operations in Africa in Nov. 1942, and together with Adm. H. K. Hewitt (*q.v.*) handled the landing of American forces on the western coast of Africa. Riding in a tank, Patton personally led his forces into Casablanca and compelled the French forces there under Adm. Michelier to surrender.

Paul, Maury Henry Biddle (1890–1942), U.S. society editor, whose widely-read gossip column was syndicated in 60 U.S. newspapers, was bo April 14 in Philadelphia. He entered the University of Philad phia in 1910. Four years later, he convinced the editor of *Philadelphia Times* that a male society editor was needed to ke "drivel" out of the society columns. In 1915, he went to the *N York Mail*, and in 1919 he was hired by the *New York Even American*, a Hearst paper. Paul took over the title of "Cho Knickerbocker," a copyrighted name owned by the paper, and i mediately injected life into the hitherto dull society page. coined the phrase "café society" and started feuds with the cially prominent when he divided society into Class A and Cl B strata. His polished and ironic style won nation-wide pop larity. He stayed with the *New York American*, later the *Jo nal-American* until his death, July 17, in New York city.

Pavlovich; Dimitri, GRAND DUKE (1891–1942), Russi nobleman, was born Sept. 6 in Ily skoïé, near Moscow. Grand Duke Dimitri, former captain Russian cavalry, was a nephew of Tsar Alexander III and cousin of Nicholas II, last Russian tsar. He was said to ha been the accomplice of Prince Felix Yussupoff in the shooti in 1916 of Rasputin, the monk who had been a close adviser a exercised great influence over the last tsar's family. The gra duke was said to have been arrested in 1917 in a counterrevo tionary plot in Petrograd (Leningrad), but fled to Paris, whe he lived for many years. He died in Davos, Switzerland, March

Peaches. The 1942 peach crop in the United States was es mated Dec. 1 by the department of agriculture 65,345,000 bu., which was 19% above the 10-year (1930–3 average. The 1941 crop was 74,364,000 bu.; the 10-year avera 54,706,000 bu. The crop in California, the leading producer, co sisted of 17,543,000 bu. of clingstones, mainly for canning, a 9,918,000 bu. of freestones. The 1941 California production w 13,834,000 bu. of clingstones and 8,918,000 bu. of freestone the 10-year average, 15,143,000 bu. of clingstones and 7,836,c bu. of freestones.

Production in all other states was less than 1,000,000 bu. apie in 1942. (S. O. R.)

Peanuts. Growers of peanuts in the United States respond to the urgent wartime need for increased producti in vegetable oils by almost doubling the peanut crop of 19 over that of 1941. The 1942 harvest for picking and threshi was estimated Nov. 1 by the department of agriculture 2,810,525,000 lb. compared with 1,476,845,000 lb. in 1941, a 163% above the 10-year (1930–39) average crop. Peanut oil, well as other oils and fats, was greatly needed to supply glyceri for the manufacture of munitions and also to add to the supp of oils for table and cooking fats. Peanut production for declined drastically after World War I, and in 1933 only abo 1,000 tons were crushed, because of low prices. In 1934 the d partment of agriculture launched a program to encourage produ tion of peanuts for oil under payments of $1,500,000 annua r diversion of peanuts to oil. From 1934 through 1939, under e diversion plan, the value of the crop averaged $39,813,000 nually and increased to $57,000,000 in 1940, at which time version payments had approximated $8,000,000. The yield in 42 averaged 673.5 lb. per ac. in the United States.

All other states produced less than 500,000 bu. each in 1942.

(S. O. R.)

eat. Lack of imported supplies stimulated peat production in the United States, which increased from 70,097 short ns in 1940 to 86,503 tons in 1941. Imports, which formerly were about the same magnitude as current production, shrunk in 40 to 21,689 tons, but increased to 22,127 tons in the first nine nths of 1941, mostly from Canada. About 75% of the supply used as a soil conditioner, 20% in mixed fertilizers, and 5% in her uses, including litter in barns and poultry yards, and pack- r material for fruits, vegetables and shrubs, so that practically entire supply is used in agriculture, and none as fuel, which is main use in the important European producing countries.

nnsylvania. One of the original 13 states of the United States, Pennsylvania is popularly known as "Keystone state." Area, 45,333 sq.mi. (288 sq.mi. water); pulation (1940) 9,900,180, of whom 973,260 were foreign-born ites, including 80,111 of German birth and 197,281 of Italian. pital, Harrisburg (83,893). Cities with a larger population Philadelphia (1,931,334); Pittsburgh (671,659); Scranton 40,404); Erie (116,955); Reading (110,568); Allentown (96,- 4); Wilkes-Barre (86,236).

History.—The congressional reapportionment act, based on the sus of 1940, reduced the representation of the state in the national house of representatives from 34 to 33. The state's general assembly, in biennial session in 1941, adjourned without redistricting the state. In order to provide for the election of members of the house of representatives by districts, Governor James called the general assembly in special session on Feb. 17, 1942, to take the necessary action. On Feb. 25 it passed a bill abolishing two districts, allowing the others to remain unchanged and providing for the election of two representatives-at-large on a state-wide ticket. The governor signed the bill at once.

In November the Republicans elected Edward Martin as governor, John C. Bell, Jr., as lieutenant governor and William A. Levengood as secretary of internal affairs; also as a justice of the supreme court and a judge of the superior court. In addition, the Republicans retained control of the senate and regained control of the house of representatives which they lost to the Democrats in 1940. They also elected 19 of the 33 members of the national house of representatives including the representatives-at-large.

EDWARD MARTIN, Republican governor of Pennsylvania, elected Nov. 3, 1942

The principal officers in 1942 were: Arthur H. James, governor; Samuel S. Lewis, lieutenant governor; Claude T. Reno, attorney-general; G. Harold Wagner, treasurer, and William I. Schaffer, chief justice.

Education. — There were in 1942 approximately 11,400 public schools, of which 1,277 were high schools. The total enrolment of pupils was 1,813,255, of whom 34,617 were in kindergarten, 1,088,591 in elementary and 90,047 in secondary schools. Current expenses for the fiscal year were $152,-939,741 and the total expenses for the maintenance of the system were $200,113,414.

Public Welfare, Charities, Corrections.—The average number of men, women and children dependent on public assistance or work relief in Oct. 1942 was 415,000, or 251,000 fewer than in Oct. 1941. Those receiving old age assistance numbered 98,808; relief was given to 168,552 dependent children and to 13,885 blind persons and 86,000 were dependent wholly or in part on WPA relief wages. The total expenditures for the month amounted to $6,354,000, of which $2,007,000 was provided by the federal government for old age assistance and dependent children.

Communications.—There were in the state 99,716 mi. of highways in 1942, 40,764 of which were classified as state roads and 22,764 as second-class township roads. The remainder were city and borough streets and county roads. There were 5,754 mi. of city streets, including 1,842 in Philadelphia. The average cost of maintenance for the three fiscal years ending June 30, 1942, was $16,524,000 a year. Highway improvements costing an average of $38,123,000 a year in 1939–42 had been paid for out of the motor licence fund. There were 11,966.33 mi. of main-line railroads in operation.

Banking and Finance.—On June 30, 1942, there were 396 banking institutions with total resources of $3,491,202,429 and deposits of $2,976,626,608. At the beginning of the year there were 1,207 building and loan associations with assets of $350,-

044,290. At the beginning of the fiscal year 1942–43 there were 681 national banks with assets of $3,943,118,000 and deposits of $3,474,266,000. The state appropriations for the biennium beginning July 1, 1941, were $331,147,595, which included $98,000,000 for public relief. The estimated receipts from taxation for the period were $414,141,822.

Agriculture.—The farmers received $5,723,000 in benefits from the federal government in 1940.

Table I.—*Leading Agricultural Products of Pennsylvania, 1942 and 1941*

Crop	1942	1941
Corn, bu.	56,898,000	56,594,000
Tobacco, lb.	48,716,000	53,293,000
Potatoes, bu.	17,696,000	23,674,000
Apples, bu.	10,031,000	9,313,000
Grapes, tons	21,500,000	16,500,000

Manufacturing.—There were 17,366 manufacturing establishments in the state, according to the census of 1940, employing 1,419,051 persons to whom $1,940,045,800 was paid in wages. The capital invested was $4,223,471,300 and the value of goods produced was $6,901,966,000.

Table II.—*Principal Industries of Pennsylvania, 1940 and 1937*

Industry	Value of Products	
	1940	1937
Metals	$2,944,848,400	$3,058,279,000
Textiles	795,457,200	819,402,500
Food	740,901,600	770,319,300
Chemicals	518,062,300	499,395,500
Paper and printing	372,074,400	350,436,600
Leather	174,963,900	175,288,000
Tobacco products	92,272,300	85,513,300

Mineral Production.—The federal bureau of mines reported the value of the mineral production of the state in 1939 at $552,355,651 as against $472,773,327 in 1938.

Table III.—*Principal Mineral Products of Pennsylvania, 1939 and 1938*

Mineral Products	Value	
	1939	1938
Bituminous coal	$188,900,000	$160,965,000
Anthracite	187,175,000	180,600,167
Pig iron	186,302,533	101,266,844
Petroleum	36,200,000	32,762,000
Natural gas	35,268,000	29,544,000
Cement	34,332,649	28,242,913

The department of the interior reported that the production of anthracite in 1940 was valued at $192,539,500 and the value of bituminous coal mined in that year was $218,504,200. On Dec. 31, 1940 there were 81,946 oil wells which produced 17,434,626 bbl. during the year. (G. W. Do.)

Pennsylvania, University of. An institution of higher learning at Philadelphia, Pa. Continuing the policy begun in 1941, the entire faculties, facilities and resources of the university were made available to the United States government for the national war effort. Research projects begun in 1941 were continued, and additional ones were initiated in 1942 in the various fields of chemistry, engineering, physics, medicine, psychology and surgery; about 75% of the projects had to do with war problems. The engineering departments and the Wharton school continued a program of training war workers for factories; several thousand persons took advantage of this instruction.

The entire university was placed on an accelerated basis with a full semester of work being offered in summer session, thus making possible graduation in three years or less, depending upon the course pursued. Approximately 3,140 students took advantage of this program in 1942. New classes were admitted to all schools of the university for the summer session, and convocations were held in February, May, June and September 1942 t meet the new program.

Two hundred forty-two members of the faculty entered th government service, the majority of these having been called t fill positions of administration or research in Washington o elsewhere.

Arrangements were completed for the establishment of a Pr Flight Preparatory school of the U.S. navy at the University o Pennsylvania in Jan. 1943, involving the training of 600 nav aviation cadets.

In the university museum, instruction in African languages and culture was offered to approximately 25 students. (T. S. G.)

Péret, Raoul (1870–1942), French politician, was bor Nov. 29 in Châtellerault, France. A doctor o law, he joined the radical socialist party in the early 1900s and was deputy for Vienne, 1902–26. He was named to his first important cabinet post in 1914, when he held the telegraph and commerce portfolio. He was minister of justice in 1917 and president of the Chamber of Deputies in 1920, 1924 and 192 As minister of finance in 1926, he was instrumental in negotiatin the Franco-American and Franco-British debt agreements, bu he resigned later in the year when the chamber failed to suppo his formula for stabilizing the franc. In 1930, while minister o justice in the Tardieu cabinet, Péret was involved in the Oustr bank scandal, and was compelled to resign under the risin clamour of the opposition for political victims. In 1931, th senate, sitting as a high court, acquitted Péret of charges o dishonesty. Subsequently his political career waned. He died at Saint-Mandé, near Paris, July 22.

Performing Right Societies. Co-operative associatio s of composers, authors and publishers of music which function as clearing houses for the censing of public performance of members' copyrighted musi. Performing right societies exist in the principal countries throug out the world. They are founded on the principle of copyrig t law that the right to control the public performance is vested in the owner of music copyright. The extent of this right vari s under the laws of different countries. In the United States an u authorized public performance is not a copyright infringeme t unless the element of profit enters into the performance.

In certain other countries, where under the law the element of profit is not a consideration, no public performance of any kind may be had of a copyright work without permission of the cop right owner. Chief performing right society of the United Stat s and sole affiliate in the U.S. of the principal foreign societies i 1942 was the American Society of Composers, Authors and Pu lishers, familiarly known under the alphabetical designation of ASCAP.

Reciprocal collection of the international affiliation of the s societies was all but halted by the war. The only European s ciety to continue exchanging funds with ASCAP was the Performing Right Society of England. Aside from this physical exchang, the customary mutual collections became chiefly matters of boo keeping.

ASCAP's perennial difficulties with proposed state laws to r strict its operations largely disappeared following its signatu of a consent decree under which its operations were conduct

h approval of the federal government. Most of the difficulties
ulting from anti-ASCAP laws were solved, either by repeal of
laws or by conciliation with its licensees.
uring 1942, ASCAP increased its activities in the promotion
American music. It completed a survey made jointly with the
erican Composers' Alliance for the purpose of cataloguing all
erican music in the standard field, aiming thereby to supple-
nt the great catalogue already assembled in ASCAP head-
rters. In co-operation with the National Federation of Music
s it sponsored the inauguration of semi-monthly bulletins
igned to stimulate interest in American music in grade schools,
schools and colleges, a special edition of the bulletin being
pared for each of the three types of schools. It continued
Nathan Burkan Memorial competition in about 100 of the
ling law schools, with a $100 prize in each school for the
copyright essay. It elected some 200 new members, its
l at the end of 1942 being more than 1,600.
SCAP's distributable revenue for 1942 was approximately the
e as in its best year, 1940. Although gross receipts were less,
to decreased income from radio, reorganization of its business
hods effected savings to offset loss of income.
SCAP is conducted by a board of 24 directors, representative
ll classes of music, and divided equally between publishers and
ers. Its president in 1942 was Deems Taylor; general man-
, John G. Paine. Its chief offices are at 30 Rockefeller Plaza.

rkins, Milo Randolph (1900–), U.S. government official, was born Jan. 28 in
waukee, Wis. A salesman and part owner of a burlap bag
ness, Perkins became assistant secretary in the department
griculture in the early days of the New Deal, and by 1935
Secretary Henry Wallace's right-hand man. Named assist-
director of the Farm Security administration in 1937, he
lled the rehabilitation loan program and cut the cost of gov-
nent housing for farmers. In Jan. 1939 he was transferred to
Agricultural Adjustment administration as associate adminis-
or and was also named president of the Federal Surplus Com-
ities corporation. He originated the food stamp plan under
h surplus foods were distributed free to the needy, and he
blished, on a nation-wide scale, the school lunch and low-
e milk distribution plans. In 1941 he was appointed executive
l of the Economic Defense board, retaining that post when
agency was reorganized as the Board of Economic Warfare
.) on Dec. 17, 1941. In April 1942 he was given control of
government program to acquire critical war materials.

rrin, Jean (1870–1942), French physicist, was born Sept. 30 in Lille and was educated at the
le Normale in Paris. He received his D.Sc. in 1897, was made
ader in physical chemistry in the Paris university and was
ed professor of sciences there in 1910. Dr. Perrin won the
el prize for physics in 1926 for his work on the discontinuity
e structure of matter and for his discovery of the equilibrium
edimentation. His writings dealt mainly with the molecular
omena of oscillation and Brown's movement in kinetics. He
named to the French Academy of Sciences in 1923. In
3, he announced the existence of transuranium, a 93rd ele-
t heavier than uranium, which had been considered the
iest. Dr. Perrin was keenly interested in the social and
tical movements of his time and supported Leon Blum's
ular Front government, of which he was made undersecretary
tate for scientific research in 1936. He was again honoured
939 when he was made president of the government's high
mittee for scientific research. An intense anti-fascist, he left unoccupied France and went to the United States in Dec. 1941. He was actively engaged in the Fighting French movement and also was associated with a school of exiled French and Belgian scientists in the U.S. He died in New York city, April 17.

Persia: *see* IRAN.

Peru. A republic on the west coast of South America and extending into the Amazon basin. Area, 532,185 sq.mi. including some 100,000 sq. mi. in dispute during part of 1942 with Ecuador. Pop. (June 9, 1940 census): 7,023,111, officially computed as white and mestizo 52.89%, Indian 45.86%, yellow 0.68%, Negro 0.47%, others 0.1%. Capital, Lima (522,826 in 1940). Other cities: Callao (69,601 in 1940), Arequipa (est. 60,000), Cuzco (est. 44,080), Trujillo (est. 33,435). President (1942): Manuel Prado y Ugarteche.

History.—The most important single factor affecting Peru's history in 1942 was the settlement of the century-old boundary dispute with Ecuador. Although, early in 1941, both disputants had accepted the offer of mediation made by Argentina, Brazil and the United States, the insistence of Ecuador that arbitration should include the question of sovereignty over Túmbez, a coastal province under the effective occupation of Peru for more than a century, angered the Peruvians and prevented the immediate settlement of the matter.

With these factors in mind, the mediating powers utilized the Conference of American Foreign Ministers held in Rio de Janeiro in Jan. 1942 to bring a final settlement between the two nations. By that agreement Peru received full sovereignty over a major portion of the disputed Amazonian territories and its claims to Túmbez were upheld.

As a result of the settlement Peru was free to turn its atten-

PRESIDENT MANUEL PRADO of Peru laying a wreath on the tomb of George Washington at Mt. Vernon, Va., during his visit to the United States in May 1942

tion to some of the other problems facing the nation. Projects for the development of Peruvian agricultural and industrial resources, both as temporary expedients to relieve the economic distress during the wartime and as measures to avoid similar troubles in the future, received the full attention of the government. Several treaties affecting Peru's economic future were signed in Washington in April 1942 as a result of a series of conferences between Finance and Commerce Minister David Dasso and officials of the United States.

Signalizing the growing friendship between Peru and the United States was the May visit of President Prado to Washington.

Education.—In 1939 there were 4,727 elementary schools (492,989 enrolment), about 216 secondary schools, several technical schools and 5 universities.

Defense.—Peru had a standing army of 15,000 and reserves of 100,000 men, a 10-vessel navy and 150 planes in 1941.

Finance.—The monetary unit is the sol, valued at 15.4 cents U.S. during 1942. The national debt was 925,817,000 sols (external: 546,078,000 sols) in 1941, of which some $54,000,000 in bonds were held in the U.S.

Trade and Communication.—In 1940 imports (foodstuffs, textiles, machinery and other manufactures) were valued at $51,668,000 (1939: $47,960,000), supplied mainly by the United States, 53.1% (1939: 41.1%), Great Britain 9.2% (8.4%), Argentina, 7.8% (5.4%). Exports were valued at $65,782,000 (1939: $71,517,000), to the United States, 42.9% (1939: 30.4%), Great Britain, 12.1% (19.6%), Chile, 10.1% (7.8%), Japan 7.8% (2.4%). The leading exports were petroleum and its derivatives 24.8% (1939: 29.0%), copper 18.5% (17.7%), cotton 17.4% (19.7%), sugar 10.7% (10.8%), ores and mineral concentrates 7.6% (5.8%). In the first eight months of 1942, imports were lower by volume, but only slightly less by value. Exports were higher in both volume and value than for a similar period in 1940.

Peru normally has good maritime and excellent air communication (by Pan American Airways) with other countries, supplemented by a railway connection with Bolivia. The National Air lines and one private company provide extensive internal air service. The highway system, greatly expanded since 1937, was being extended and improved in 1942. Partially completed, with construction crews at work on the remaining miles, was an important highway connecting the Pacific coast and the Amazon basin, and planned eventually to reach Iquitos.

Agriculture.—Cotton and sugar are the leading agricultural products, with rice, coffee, maize, wheat, coca and vegetable ivory also important. Cotton production in 1942 was estimated at 73,225 tons (1940: 83,030 tons; 1941: 78,275 tons), with a 20% reduction in acreage planned for 1943. Domestic consumption, however, increased 23% in 1941 and showed a further increase in 1942 which somewhat offset export losses. Sugar exports (301,954 tons in 1940) decreased considerably in 1941 and 1942. Insect pests caused an approximate 40% decrease (as compared to 1941) in the rice crop.

Mineral Production.—Metal production in 1940 (in bars, ores and concentrates) was: antimony 896 tons, bismuth 383 tons, copper 38,557 tons, manganese 222 tons, gold 8,963 kg., silver 573,867 tons, lead 37,072 tons, vanadium 2,167 tons, molybdenum 364 tons, zinc 31,588 tons. Beginning in 1941, the United States by agreement purchased all surpluses of Peruvian antimony, copper, lead, tungsten, vanadium and zinc.

Petroleum is found in several sections of Peru, but production centres in the north coastal region. Oil production in Peru rose from 10,000,000 bbls. in 1931 to a 1937 high of 17,595,000 bbls. In 1941 estimated production was 12,800,000 bbls. Shipping shortages caused losses in 1942.

Rubber, formerly produced on a considerable scale, dropped in 1940 to a production of 70 tons. During 1941 and 1942 greatl renewed interest, along with improved transport facilities, brough stepped-up production. (*See* also HISPANIC AMERICA AND WORL WAR II.) (C. N. G.)

Pessôa, Epitacio da Silva (1865–1942), Brazilian poli tician and lawyer, was bor May 23 in Umbuzeiro, Brazil. He received his law degree i 1886 and was named secretary of justice in the state of Para hyba do Norte in 1889. He was minister of justice and of th interior, 1898–1901, served on the supreme court, 1902–1912 and was also senator and attorney general. He was Brazil's chie representative at the Versailles peace conference in 1919. Tha same year, he was elected president of Brazil. When his terr expired in 1922 he was elected a member of the Court of International Justice in The Hague. In 1932, President Hoover ap pointed Dr. Pessôa as non-national commissioner in the per manent Anglo-American arbitration commission. He died in Ri de Janeiro, Feb. 13.

Pétain, Henri Philippe (1856–), French soldier an statesman. See *Encyclopædia Br tannica* for his biography. He was called from virtual retiremen in 1939 to become French ambassador to Spain after Franco triumph in the civil war and remained in this post after the be ginning of war in 1939 until May 18, 1940 when, with France army falling back in a retreat approaching a rout, he was sum moned to Paris to act as vice-president of the government counc and adviser to the minister of war. On June 16, 1940, he suc ceeded Paul Reynaud as premier, and the next day he was force to sue for peace. He then began the painful task of reconstructio under the watchful eye of France's conquerors. Moving his gov ernment to Vichy July 2, he secured from the national assembl authorization to prepare a new constitution. On July 10, 194 Pétain assumed dictatorial powers.

Pétain in 1941 apparently followed a two-way policy in whic he alternately submitted to Germany, then resisted German de mands for the French fleet and for bases in North Africa. O April 7 he declared that "honour commands that we shoul undertake nothing against our former allies (Britain)." The nex month, however, he approved "in principle" the Hitler-Darla talks on collaboration. Again, on Aug. 12, he announced tha France would work with Germany in the European "new order' but on Jan. 1, 1942, he appealed to the Reich to ease the hars occupation terms. Germany subsequently agreed to a "conce sion"—the release of a number of French war prisoners if i return French workers would go to Germany to work in wa factories. This request, passed on to French workers by Pierr Laval, proved unpopular. Few workers voluntarily consented t go; the Vichy government later compelled many to emigrat Pétain protested bitterly against U.S. occupation of French Nort Africa in Nov. 1942 and severed diplomatic ties with Washingto Two days later, he protested the total occupation of France b German troops as a breach of the armistice terms. Shortly afte wards, he rebuked Adm. Darlan for joining the Allies; the latte however, insisted he was acting in the name of the Marshal, a "unwilling" prisoner of the nazis. On Nov. 18, Pétain hande over to Laval dictatorial powers to make all laws and decree

Petrie, Sir (William Matthew) Flinders

(1853–1942), British Egyptologist, was born June 3 in Charlto England. He spent 45 years exploring and excavating Egypti ruins and wrote about 75 volumes on his work, but in 1926 i left Egypt because the Egyptian department of antiquities wante rtual dictatorial powers over almost every phase of his work. e then went to Palestine, where he excavated ruins at the site ancient Gaza. His later works include *Seventy Years in Arch- ology*, an autobiography (1931), *Palestine and Israel* (1934), *gyptian Architecture* (1938), *Making of Egypt* and *Egyptian ience* (1939). He died in Jerusalem, July 28. (See *Encyclo- edia Britannica.*)

etroleum. As the year 1942 closed, Hitler's drive for Russian and near eastern oil had stalled, and his 42 score of conquest so far as oil was concerned was one issian oil field—Maikop—important but minor. The high barrier the Caucasian mountains still lay between the farthest advance the nazi wehrmacht and the rich Baku oil fields.

Russia ranks second only to the United States in oil produc- n, with a total output in 1941 of 238,150,000 bbl. (excluding khalin) accounting for about 11% of the total world produc- n. The Maikop-Kuban field, in nazi hands in 1942, has an nual production of about 17,000,000 bbl., or about 8% of the al Russian production.

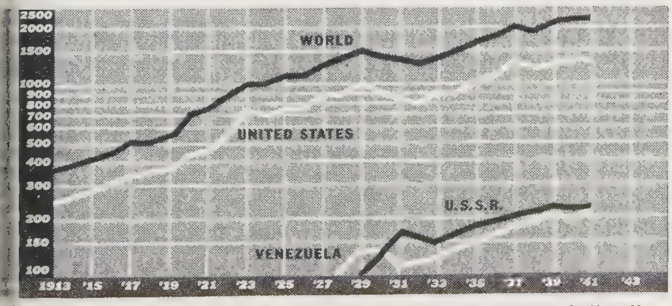
The bulk of Russian oil comes from the Baku-Azerbaijan fields the Apsheron peninsula which projects into the Caspian sea the eastern end of the Caucasus. They make up about 70% the soviet's total production. The Groznyi field, inland from Caspian and along the north bank of the Caucasus, also ded Hitler. This field produces about 17,000,000 bbl. annually. ikop-Kuban, Groznyi and Baku-Azerbaijan account for about % of Russia's annual production. The remaining 5% principally nes from the Emba field, northwest of the Caspian sea.

Not only had Hitler's drive fallen short of the Russian oil ze, but also of the rich oil fields in Iran and Iraq.

On the other hand, the score of oil conquest by the new axis tner Japan was highly impressive in 1942.

apan's domestic production is insignificant—2,659,000 bbl. in .1. By the conquest of the Netherlands East Indies, Burma, awak and Brunei, it gained control of countries having a total nual oil production of 68,366,000 bbl. Of course Japan was ble immediately to gain from these fields a production as large hat because of the demolition of wells, refinery equipment and like. But assuming that it retained its hold on this conquered itory, it had, in this one stroke, secured adequate petroleum ources to prosecute by force of arms its dream of a greater a. In one year it acquired control of fields with an annual duction greater than the total held and acquired by Hitler in ee years at war.

Germany had a total annual production of 4,438,000 bbl. in 1. When Hitler took Austria, Czechoslovakia and Poland in 9, he added an annual oil production of 692,000 bbl., 109,000 and 3,319,000 bbl. respectively. He added France, 479,000 ., in 1940; Hungary, 2,474,000 bbl., and Rumania, 38,147,000 , in 1941. Italy had a small production of 46,000 bbl. and ed Albania, 1,381,000 bbl., in 1941. Thus the petroleum production under German-Italian control totalled 68,327,000 bbl. (including Maikop production) as against 68,366,000 bbl. under Japan's domination.



AL WORLD PRODUCTION OF PETROLEUM and output of the three cipal producing countries, as compiled by *The Mineral Industry*

It may be assumed that during three years of war, Hitler drew heavily upon the oil reserves built up in preparation for the nazi blitz. The bulk of the increased demands for petroleum products created by his augmented mechanized armies, air fleets and sea craft had to be met by increased production of synthetic fuels and oils from coal; and these facilities would appear to be wholly inadequate to keep up with the war demands.

Even with the loss of East Indies oil, the Allies were in 1942 statistically far ahead of the axis partners in their control of oil production sources as shown in the following table:

Oil Sources, 1941 Production

Allies	Thousands of Barrels	Axis	Thousands of Barrels
Controlled by .	1,820,749	Controlled by .	136,693
Available to . .	269,394	Available to . .	none
Total	2,090,143	Total	136,693

The statistical picture of the relative positions of Allied and axis powers as to oil may, however, be entirely misleading. Control does not always mean availability, as for instance a source of oil may be cut off or reduced because of submarine blockade. There may be controlled sources which for all practical purposes are out of range of ready utilization. For instance, it was difficult for Russia to get all the oil it needed from some of its own fields in the Caucasus because the German advance cut off pipe lines and other transportation media.

Iraq was in 1942 under the control of the Allies; nevertheless shipment of Iraq oil to the Mediterranean was not resumed after the occupation of that country by the British because of the difficulty of Mediterranean oil transportation. On the other hand, the Iranian oil fields furnished increased amounts of oil because shipment could be made southward by way of the Persian gulf.

In this war of long supply lines, transportation, almost more than control, tells the story. Axis submarines took a terrific toll of Allied tankers. This and the diversion of tankers from civilian to war use were the direct cause of a shortage of gasoline and fuel oil in the east coast states of the United States, resulting in drastic rationing of motor fuel and furnace oil.

A year after Pearl Harbor found the United Nations turning of necessity their chief reliance for vital oil products upon the western hemisphere—chiefly upon the United States. It found the United States producing crude oil and natural gasoline at the rate of more than 400,000 bbl. per day and capable of producing more—for American production is prorated. Nevertheless, because of greatly curtailed drilling activity due to steel conservation and to the War Production board's Order M-68 issued in Jan. 1942, limiting oil well drilling to one well per 40 ac., the rate of discovery of new oil reserves greatly decreased.

From 1939 to 1941, on an average of 2,963 wildcat wells per year were drilled and these discovered an average of 387,000,000 bbl. in new fields. From 1936 to 1938, fewer wildcat wells by 22% were drilled, yet they discovered 78% more oil. Both the government and the petroleum industry agreed that something must be done to stimulate exploration and wildcat drilling. The industry asked a substantial increase in the ceiling on crude oil prices and corresponding increases in the wholesale prices of refined products and in the retail prices to the consumer. It also recommended that necessary production materials and supplies be made available.

Not until Pearl Harbor and the subsequent military events affecting oil supply and supply lines, was the American oil industry put to a test in meeting war requirements. In fact, during the first two years of the war in Europe, there was far less drain on American oil sources than had been anticipated. But in 1942—with America itself in the war—the American petroleum industry was called upon to supply the bulk of the 100-octane gasoline, toluene, aviation lubricants, materials for synthetic rubber, and many other critical petroleum products needed to insure victory for the United Nations.

After Pearl Harbor, the transportation bottleneck affecting the east coast area became more acute since Germany intensified its submarine campaign and directed it particularly against tankers. Movement of tankers moreover was dictated by military rather than by civilian requirements.

Gasoline.—To meet the needs of eastern United States, shipments of crude oil and of products by rail were increased, but they far from made up for the tanker shortage; therefore, rationing of gasoline throughout the east coast area went into effect not alone as a means to conserve gasoline but also rubber. This was in May 1942. Meantime the rubber shortage was coming to the fore in such a way as to foreshadow national gasoline rationing as a rubber conservation measure. In December, national rationing went into effect, and in the meantime a federal edict keeping driving to a maximum speed of 35 mi. an hour was promulgated by the president.

In June 1942 the War Production board approved the construction of a "big-inch"—24-inch—pipe line, the largest diameter oil pipe line on record—to run from Texas to Norris City, Ill This was planned by the end of the year to afford relief to the war-blighted east by increasing the flow by connecting eastern pipe lines, barge and tank car into that area. The line was la extended to the New York-Philadelphia refinery areas and completion date was scheduled for Feb. 1943. The capacity of line was planned to be 300,000 bbl. daily.

OBSERVING THE EFFECT of low atmospheric pressure on gasoline, which gives off vapour at 26,000 ft. above sea level. New types of tanks and feed lines were designed for flight at high altitudes as air warfare approached the level of the stratosphere in 1942

Under the authority vested in the Office of Petroleum ordination, the American petroleum industry went into a progr of "quick conversion" of refinery facilities to increase the outp of war materials. The major features of this program invol greatly increased production of aviation gasoline and of the r materials for synthetic rubber. Plants went to work on making of toluene for T.N.T.; benzene, isobutane, butadiene a codimer for aviation gasoline. Isobutylene production was stepp up for butyl rubber.

One of the most spectacular war jobs done by the Americ petroleum industry was that of multiplying production of 1 octane gasoline, which only a few years previously was largely laboratory product. This "super-fuel" could mean the mar of victory in the air—in the Pacific, in Africa, in Europe and China—according to Petroleum Administrator for War Har L. Ickes who stated that the United States was dangerously sh of capacity for making 100-octane gasoline; having at that ti a production of only about 40,000 bbl. a day, while one motored bomber could use several barrels in a single hour flying. The industry set out to double, then treble, then incre by fourfold the production of this fuel. Construction of n units, largely financed by the government, proceeded with speed and was continuing at the close of 1942. The output of ex ing facilities showed a phenomenal increase.

Rationing of fuel oil used for heat in homes went into eff in the fall, and fuel oil use in 30 states was ordered reduc $33\frac{1}{3}\%$, or 100,000,000 bbl. per year. Fuel oil shortage in the e was further complicated by the diversion of supplies from t east coast to north Africa in connection with American milita operations.

The American petroleum industry was adjusting its refin operations to fit into the synthetic rubber production progr under Rubber Coordinator W. M. Jeffers, and rubber pla using petroleum products as a base material were being c

30-MI. PETROLEUM PIPE LINE from Longview, Tex., to Norris City, Ill., constructed in 1942 at the record rate of five miles a day. With a carrying acity of 9,000,000 barrels a month, the pipe line was the largest in the ld. The War Production board on Oct. 28, 1942, authorized extension of the line to New York city

ucted and were expected to be operated co-operatively by oil panies in several regions of the United States.

n Dec. 1942, President Roosevelt appointed Mr. Ickes peeum administrator for war. The new agency of Petroleum ministration for War supplants the former Office of Petroleum ordinator for War which Secretary of Interior Ickes headed on establishment May 28, 1941. The government's petroleum adistration for war was organized regionally and departmentally was assisted in an advisory way by petroleum industry comtees. Also assisting was the Petroleum Industry War council prising oil industry representatives who met regularly with Ickes' organization in Washington.

iladelphia. Third largest city in the U.S.A. and the largest city in Pennsylvania, Philadelphia had a popion of 1,931,334 by the federal census of 1940. This figure eased to an estimated 1,980,000 in 1942. Mayor (1942): nard Samuel.

he influx of workers in war industries was largely responsible the increase in population. The army quartermaster's depot, ch usually had employed about 3,000, had about 16,000 on ay roll in 1942. There was a similar increase in the number workers in the League island navy yard as well as a great ease in the number of employees of private corporations ened in war work.

he increase in population seriously affected the housing situn. The newcomers found it difficult to get living quarters when they offered high rent out of the high wages which they received. The payment of high wages led the local housing authority, which had built a large number of small houses and apartments for families with low incomes, to announce that when leases expired it would raise the rent of those families whose income had been increased and at the same time would lower the rent for those families whose incomes had remained stationary.

In preparation for a possible hostile attack, the Citizens Defense corps ordered frequent blackouts. A committee was appointed to superintend the evacuation of the city in an emergency.

In the election of Nov. 3, 1942, General Martin, the Republican candidate for governor, carried the city by about 600 and the Republicans elected three of the six members of the national house of representatives from the city, defeating two Democrats who sought re-election.

In order to provide additional revenue the city council levied a tax of 1½% on the earnings of all workers, a tax which the courts decided could be collected from federal employees as well as from nonresident workers.

(G. W. Do.)

Philately. Poland, although her territory had been completely dominated by hostile armies, issued new stamps pertaining to the war effort: and these were not only legal, but could be properly postally used. Philatelists found that this was because Poland's ships were still free, and post offices on these ships were, by international convention, Polish post offices.

During 1942, the total number of stamps listed as new emissions in the Standard catalogue dropped to a new low—scarcely 1,000 were listed and most of these classified as either purely postal or air mail issues.

Because of the success of the United States Philatelic agency at Washington, D.C., where postage stamps in select condition were furnished for philatelists, the treasury department opened a Revenue Philatelic agency, also at Washington, purveying revenue stamps for collectors.

The enormous accumulation and collection of the late Col. E. H. R. Green, son of the famous Hetty Green, posthumously dragged him into the limelight as a canny and astute philatelist. Seven sales of material were held during 1942, and brought much larger sums than many expected.

The War.—Impetus was given to the collection of censor markings and war postmarks, while at the same time the exigencies of national security reduced the collectible items. During World War I, few collected the various army post office markings, making some of them rather rare when, later, postal marking collectors began to look for them. In 1942, the trend was toward the elimination of all distinguishing markings, such as the A.P.O. numbers which made army post office markings distinctive. Even some overprints, such as the Canal Zone overprints of the United States, were omitted in some instances.

V for victory spread to philately. The Belgian lion upheld a V on a shield in a Belgian Congo issue. The only United States postal issue of the year had a V design formed by the wings of a challenging eagle. Cuba's V, with the word "Victoria," dominated an orange one-half cent stamp placed on every piece of mail.

Costa Rica permitted a huge V and torch of liberty to be blazoned atop of the national banner in one issue.

Savings Stamps.—At last, the Standard catalogue opened its pages to the listing of these issues of the United States. Though they could not be called postal items nor yet revenue stamps, they were, like the thrift stamps of 1917–19 and the war savings issues of other countries, of interest to the collector and their sale for collecting purposes was a net gain to the country of issue. It was rumoured that the treasury department was working on plans to permit these stamps to be cancelled when turned in for the purchase of war bonds and retained for collections. A complete set of United States war savings stamps cost $6.85 for singles (10c, 25c, 50c, $1 and $5 denominations).

Commemoratives.—Two new commemoratives of the United States were issued in 1942. One, the five cent China commemorative, with portraits of Dr. Sun Yat-sen and Abraham Lincoln, could be called a war issue. The other, for the centenary of Kentucky's statehood, was a definite commemorative, in keeping with the series of statehood issues inaugurated some years ago (1927–28) with the Vermont, Massachusetts and Charleston-Carolina issues.

The Argentine republic, probably with some idea of emphasis on Pan-American solidarity, issued a Columbus lighthouse commemorative stamp on Columbus day (October 12). Switzerland's trilingual issue was an appeal for collection of scrap materials. To conserve paper, the Union of South Africa drastically reduced the dimensions of its stamps. The triumph of United Nations arms in Syria was signalized by Fighting French overprints on the familiar Syrian issues. Cuba issued a series warning against the fifth column of spies.

Literature.—The war forced continued conservation of materials, and the Standard Catalogue, in the United States, was published in sufficient quantity to meet advance orders, and no more. The result was a definite shortage of catalogues. This is interesting, because for the first time, the catalogue appeared in three forms instead of one—a volume covering the whole stamp-issuing world, as previously, and also in two limited volumes: one for the issues of the United States, the British empire, and the American colonies; the other for the rest of the world.

Clarence W. Brazer won the Eidsness award of the Washington (D.C.) Philatelic society for his new volume, *Essays for U.S. Adhesive Postage Stamps.* It was issued as a handbook of the American Philatelic society. (M. HA.)

Philippines, Commonwealth of the.

The Philippin Islands exten between north latitude 4° 21′ and 21° 10′, and lie approximatel 800 mi. to the east of French Indo-China. The northernmost the islands are in the Bashi channel immediately south of Fo mosa, while the southernmost group, usually known as the Sul archipelago, approaches to within 20 mi. of British North Borne The number of islands is well over 7,000, with a total area 115,600 sq.mi. By regular steamship routes, Manila is 631 naut cal miles southeast of Hongkong, 1,757 mi. southwest of Yok hama, 1,370 mi. northeast of Singapore, 4,838 mi. west of Hon lulu and 6,929 mi. southwest of San Francisco. The census 1939 showed a total population of 16,000,313, including the fo lowing principal non-Filipino nationalities: Chinese, 117,48 Japanese, 29,057; Americans (U.S.), 8,709; Spanish, 4,627; Ge mans, 1,149; British, 1,053. The estimated population at the en of 1942 was 17,600,000. Principal religions: Roman Catholi 12,603,365; Aglipayan, 1,573,608; Mohammedan, 677,903; paga 626,008; Protestant, 378,361. Capital, Manila (623,492), on th northern large island of Luzon. Other chief cities: Cebu (146 817), Iloilo (90,480), Legaspi (41,468).

Organic laws are the Philippine Independence act, 48 Stat. 45 as amended by various subsequent laws, the most important bei the Philippine Economic Adjustment Act of 1939, 53 Stat. 122 and the Quota Suspension Act of 1941, 55 Stat. 853; and th Philippine Constitution of 1935 adopted in accordance therewit as amended in 1939 and 1940. The commonwealth president an vice president are elected at large; the amendments of 1940 pr vided for a congress with a senate elected at large and represent tives elected by districts, superseding the previous unicamer national assembly. The Philippines are a commonwealth und the sovereignty of the United States until July 4, 1946, wh independence is provided for by the Philippine Independence ac The chief officer is a representative of the president of the Unit States known as the United States high commissioner to t Philippine Islands. The principal commonwealth officers in 19 were Manuel L. Quezon, president, Sergio Osmena, vice-presiden and J. M. Elizalde, resident commissioner to the U.S., who sits congress with the right of debate, but without vote.

History.—On July 26, 1941, President Roosevelt had call General Douglas MacArthur from retirement and his position military adviser to the commonwealth, and placed him in co mand of all U.S. army forces in the far east. Under his co mand some 90,000 of the commonwealth army (including 3 re ments of constabulary) and about 30,500 U.S. regulars (includi some 10 regiments of Philippine scouts) were mobilized.

Coincident with Pearl Harbor and Hongkong, the Philippi were attacked by Japan on Dec. 8 (far eastern time), 1941. series of aerial attacks during the following week destroyed t Cavite navy base, and the Clark, Iba and Nichols air fields, t gether with most of the defending planes. Immediately landi were attempted at numerous points on Luzon island, particula along the "Ilokano" or northeastern coast, and several bea heads were successfully established before the middle of cember. Defensive land action continued throughout Decemb The principal theatre was the central plain of Luzon north Manila. Within a comparatively short time the overwhelmi numerical superiority of the enemy, favoured with powerful na and air protection, forced the stubbornly resisting U.S.-Filipi forces toward Manila from both the north and the south. Dec. 24, 1941, High Commissioner Francis B. Sayre, Gene MacArthur, and President Quezon, together with their sta were evacuated to Corregidor. Manila was declared an open ci

The forces defending southern Luzon slipped around Lagu de Bay and joined the main northern forces on a line extendi om the Pampanga swamps into Bataan peninsula. With enor- ous superiority in the air, the Japanese gradually forced the fenders through the peninsula toward Corregidor, off the south- n tip across a two-mile strait; this fortress guarded the rear d denied use of Manila bay and harbour to the enemy. Davao southern Mindanao was invaded on Dec. 20, and the Japanese tered Manila from the south on the night of January 1–2, 1942. ıring the last week in Feb. 1942, the high commissioner and e commonwealth president with their staffs were evacuated, and March General MacArthur moved his headquarters to Aus- ılia.

Subsequent to the fall of Bataan on April 9, 1942, the enemy entlessly attacked Corregidor and its sister forts with artillery ounted on the Bataan and Cavite coasts and with a heavy con- ntration of air forces. Corregidor fell to the Japanese on May 1942. In the meantime, the enemy had invaded key points the Visayan islands; Cebu on April 10 and Iloilo on April 16. e invasion of Parang and Tagaloan on the island of Mindanao s effected on April 29 and May 3.

The outnumbered Americans and Filipinos threw back repeated acks by veteran Japanese troops with resourcefulness and acity and greatly delayed the enemy's southern thrust.

After Manila had been declared an open city and evacuated by defenders, the Japanese subjected it to repeated bombings in ich churches, schools and residential sections as well as docks l other installations of military significance were destroyed. many parts of the archipelago undefended cities, towns and lages of no military value were ruthlessly bombed and machine- nned from the air. Sternly repressive measures were taken in ling with the civilian population.

By the end of 1942 presumably all important coastal points in principal inhabited islands were under enemy control, but iable reports indicated sporadic attacks from a number of errilla bands operating from isolated or mountainous up-country nts. A large prisoner-of-war camp was established at Camp Donnell, 60 mi. north of Manila. More than 3,500 civilians pproximately 2,500 Americans and 1,000 British and Dutch) re held in Manila at Camp Santo Tomas. Other civilian con- ntration camps were located at Baguio, Legaspi, Cebu, Barolod, ilo, Davao and Malabalay.

Filipinos, allowed limited freedom of residence, occupation and igion, were subjected to a carefully designed policy of attrac- n. The Japanese re-opened a considerable number of elemen- y schools, but all textbooks were censored and the curricula re distorted to include the Japanese language and to suppress S. and native history, civics and culture. Elaborately hedged omises of independence, with the Filipinos as reliable adherents Japanese policy in the far east, were made.

Jorgé Vargas, formerly executive secretary to President Que- n, with cabinet rank, was appointed late in Jan. 1942 by the panese commander-in-chief in the Philippines to be chairman the executive commission. This commission assisted the Jap- se military authorities in the establishment of "Central Ad- nistrative Organs and Judicial Courts" which apparently con- ed of 7 departments and 40 or more bureaus and courts. The partments were reportedly headed by Filipinos formerly hold- high positions in the commonwealth government.

Political Developments.—In accordance with the constitu- nal amendments of 1940, commonwealth officers and members congress had been elected in Nov. 1941. President Quezon and e-President Osmena were inaugurated for their second terms Dec. 30, 1941, at Corregidor. However, the congress was able to sit by reason of the invasion. In March 1942 High mmissioner Francis B. Sayre arrived in Washington, where his ce was temporarily established. On Sayre's resignation, the president of the United States, by executive order of Sept. 16, 1942, transferred the duties, powers and functions of the high commissioner and his office to the secretary of the interior. The temporary office in Washington consisted of an economic adviser and a financial expert with limited clerical assistance principally engaged under a presidential directive in preparation of plans for the financial and economic rehabilitation of the Philippines.

President Quezon and Vice-President Osmena arrived in Washington in May 1942 to set up the official executive establishment of the commonwealth. President Quezon signed the United Nations pact for the commonwealth and represented it in the Pacific war council. Under the terms of the 1940 amendments to the Philippine constitution, President Quezon would serve until late in 1943, when he would automatically be succeeded by Vice-President Osmena.

Education.—Public schools, March 1940: number, 12,057; enrolment, primary, 1,572,639; intermediate, 277,574; secondary, 90,579; collegiate (normal and technical), 3,777; total, 1,944,569. Private schools, June 30, 1940: number, 439; enrolment, kindergarten, 2,844; primary, 41,861; intermediate, 22,578; secondary, 51,055; collegiate, 31,153; total, 149,491; in addition, recognized schools (136) offering special vocational courses had 9,188 enrolment.

Finance.—The monetary unit is the peso, fixed at a mint par of U.S. $0.50; exchange rates showed only negligible fluctuations from the par rate in 1941. Estimated general fund balance, June 30, 1942 on deposit in the U.S., 100,000,000 pesos. Total bonded indebtedness, June 30, 1941, 149,507,000 pesos; total sinking fund reserve 77,484,863 pesos. Currency dollar reserves on deposit in the U.S. as of June 30, 1942: cash surplus exchange standard fund plus cash balance treasury certificate fund U.S., $134,169,734. Currency in circulation and available per circulation as of Sept. 30, 1941, 222,407,808 pesos, including notes of the Bank of the Philippine Islands (1,358,385 pesos) and of the Philippine National Bank (2,299,816 pesos).

Trade and Communication.—During 1941, Philippine overseas markets, except in the U.S., were virtually closed on account of limited tonnage and restrictive control of foreign exports and funds. Overseas trade values Jan. 1 to Sept. 30, 1941 were: Shipments to U.S., 227,000,000 pesos (of which 77,000,000 pesos were gold and silver bullion and concentrates); exports to foreign countries, 41,000,000 pesos; total outward, 268,000,000 pesos; shipments from U.S. 180,000,000 pesos; imports from foreign countries, 43,000,000 pesos; total inward, 223,000,000 pesos. The total overseas trade value, 491,000,000 pesos, was 11% in excess of that for the same period in 1940 and only 16% under the total for the entire year of 1940. Outward values of principal commodities, Jan. through Sept. 1941: coco-nut oil, 22,000,000 pesos; copra, 17,000,000 pesos; desiccated coco-nut, 9,000,000 pesos; abaca, 29,000,000 pesos; cordage, 3,000,000 pesos; embroideries, 6,000,000 pesos; logs, lumber, 7,000,000 pesos; gold and silver bullion and concentrates, 77,000,000 pesos; other minerals, 12,000,000 pesos; centrifugal sugar, 48,000,000 pesos; refined sugar, 7,000,000 pesos; cigars, 4,000,000 pesos; pineapples, 3,000,000 pesos. Similarly for inward commodities: wheat flour, 10,000,000 pesos; rice, 1,000,000 pesos; other foodstuffs, 25,000,000 pesos; iron and steel, 15,000,000 pesos; automotives, 8,000,000 pesos; machinery, 17,000,000 pesos; non-metallic minerals and chemicals and manufactures thereof, 43,000,000 pesos; textiles, 50,000,000 pesos.

Communication.—In 1940: railroads, 840 mi.; highways (kilometres) first-class, 11,771.9; second-class, 7,393; third-class, 3,795.1; trails, 4,912.1. Motor vehicles registered: automobiles, 33,898; trucks, 20,236, motorcycles 630. Airways: 1,171,453 passenger miles; 20,407 passengers; 3,083,415 lb. air express;

THE LAST U.S. COMMANDER ON BATAAN, Maj. Gen. Edward P. King, Jr., as he waited with his aide at Lamao in April 1942 to discuss terms of surrender with the Japanese

OFFICE of the *Manila Herald* burning during a Japanese air raid shortly fore the fall of the Philippine capital Jan. 2, 1942

MARIVELES, at the southern tip of Bataan peninsula across a narrow strait from Corregidor Island, was the tiny port through which the U.S.-Filipino defenders received their meagre supplies before the surrender of April 9, 1942

855 lb. air mail. Telephones, 31,419. Telegraph lines, 14,716,- o kms. Broadcasting stations, 6.

Agriculture.—The total estimated value of crops in 1938 was 7,144,000 pesos. Area planted and value, leading crops: palay ough rice) 1,912,000 hectares, 136,423,000 pesos; sugar cane, 8,000 hectares, 113,559,000 pesos; coco-nut, 643,000 hectares, 126,000 pesos; abaca, 508,000 hectares, 22,672,000 pesos; corn, 3,000 hectares, 19,424,000 pesos; bananas, 92,000 hectares, 10,- 2,000 pesos; tobacco, 75,000 hectares, 4,125,000 pesos. Live- ck and poultry (1939) were valued at 141,514,451 pesos. mber and value: carabaos, 2,918,730, 78,826,516 pesos; hogs, 48,515, 26,100,326 pesos; cattle, 1,349,264, 20,077,610 pesos; ckens, 25,365,102, 8,994,591 pesos; horses, 340,433, 6,222,661 os; goats, 402,173, 874,155 pesos; ducks, 690,868, 418,592 os.

Manufacturing.—Chief manufactures are centrifugal sugar, ora, coco-nut oil, desiccated coco-nut, cordage, cigars and cigar- es and embroideries. Production of sawmills in 1940 was 332,- 3,721 bd.ft.; number of mills, 148.

Mineral Production.—Total estimated value of minerals pro- ced in 1940 was 91,626,384 pesos. Chief products: gold, 1,- ,745 fine oz., 76,563,888 pesos; iron, 1,221,126 long tons, 33,728 pesos; copper 20,014,918 lb., 3,487,701 pesos; chromite, ,919 long tons, 2,661,764 pesos; silver, 1,394.736 fine oz., 74,094 pesos; manganese, 48,036 long tons, 1,287,011 pesos; d, 2,080,381 lb., 117,927 pesos; platinum, 6.03 troy oz., 271 os. (*See* also Japan; World War II.) (E. D. H.)

ilosophy.

Two of the most important philosophical events of 1942, at least for western readers, re the translations into English of *The Gospel of Ramakrishna* Swami Nikhilananda and seven books of Søren Kierkegaard Walter Lowrie, David Swensen and Alexander Dru. Both are nslations of most significant but very different religious inter- tations of reality.

The Gospel of Ramakrishna belongs among the great works of stical and devotional literature. An impoverished Brahmin, makrishna transcended not only the caste distinctions of India the creedal variations and conflicts of the major religions h which he came in contact. He embraced all of the main hs of India along with Christianity and the religion of Islam, he is not eclectic. On the many paths to God he finds one tral thing, an object of love, a destination, a focus of mystical tasy, that is the same for all faiths. His approach to God is ely religious in this sense. It is a devotional attitude in respect which specific contents and creeds become irrelevant.

Ramakrishna renounces the world of action. He repudiates orm, or helping the world. Leave that to the Lord, he says. one loves God more he will do less in the world of action. deep devotional concern leads him astray in this respect, at st to western eyes. But the profundity of his devotion is ortant. Like all India he turns to mystical identities and stantives rather than to causation and process.

The English translations from the Danish of seven of Kierke- rd's works brought to a large public a tense, religious mind y different from the serene surrender of Ramakrishna. Though h the Indian saint and Kierkegaard are religious, non-rational either mystical or subjective in their approach to the world, storm and passion and the struggle of the one and the ine passivity of the other are the west and east all over again.

Other books of philosophical interest published were: *The isis of Our Age* by P. A. Sorokin, a swashbuckling, over-con- ent synthesis of history on a cyclical pattern, but withal chal- ging; *Introduction to Semantics* by Rudolph Carnap; *Social usation* by R. M. MacIver; *World Hypotheses* by Stephen C. Pepper; *Experience and Substance* by DeWitt Parker; *The Philosophy of Alfred North Whitehead*, edited by Paul A. Schilpp; *Foundations for a Science of Personality* by Andras Angyal; *The Intent of the Critic* by Wilson, Foerster, Ransom and Auden; *Reason and Revolution* by Herbert Marcuse, a study of Hegel and the rise of social theory; *The Philosophy of Edmund Husserl* by E. Parl Welch, though largely paraphrase and extracts, valuable because Husserl was virtually unknown in America; *A Dialectic of Morals* by Mortimer J. Adler, an account of the author's conversations with his class at the University of Chicago. (B. B.)

Phoenix Islands: *see* Pacific Islands, British.

Phosphates.

Mine production of phosphate rock in the United States in 1941 was 4,920,843 long tons, deliveries 4,688,312 tons, and consumption is estimated at 3,594,000 tons, all material increases over 1940. There were no imports, and exports increased, the 820,396 tons exported in the first nine months of 1941 being greater than the total for the year 1940. Mine production having increased more than sales, producers' stocks were at the highest level in a decade.

Production data from countries supplying about half of the normal output showed an increase of 11% over 1940, to 5,635,800 tons, but it is probable that other major producers, especially in Africa, were not able to maintain their 1940 level, and it is questionable whether the 1941 world total was any greater than the 10,000,000 tons estimated for 1940. The 1941 Tunisian output was estimated at 720,000 metric tons, and that of Curaçao at 125,000 tons, as compared with 4,736,546 tons in the United States. (G. A. Ro.)

Photography.

During 1942 all branches of photography were directly affected by war production. Great quantities of photographic materials were produced in Great Britain and the United States for immediate use on all war fronts. As it became increasingly important to maintain large photographic supply depots throughout the world, the scarcity of cameras, films, papers and other photographic products became a reality among the nonmilitary classes which included the professional photographers as well as the amateurs. The war between the United Nations and the axis accelerated the production of certain essential photographic products. New lenses, films and equipment were being made for exclusive military use.

Industrial Photography.—Photo tracings were used in many industrial plants to shorten the time required for making line drawings. Photographers and engineers in the aircraft industry pioneered in work for reducing cost and time in the making of templates. The Eastman Kodak company produced matte transfer paper in addition to their matte transfer film for use in the aircraft and other industries for making photo templates. Still and motion picture high-speed photography was finding widespread use in testing laboratories for recordings of vibrations, photo-elastic stress analyses, spectra and other physical phenomena. The X-ray pictures of castings, wells, small assemblies and other objects eliminated flaws and sped up production. The high-speed X-ray was valuable in ballistic studies. A new X-ray tube developed by Dr. C. M. Slack and his assistants of the Westinghouse Lamp Division Laboratories made high-speed X-ray pictures at a millionth of a second. Infra-red photographs of welded parts showed greater contrast between the joined metals, a clear definition of the outlines and the extent of defects and impurities.

Colour Photography.—Ansco colour film was introduced and offered to the armed forces and government departments. This multi-layer film was the first one which could be exposed, developed and projected by the user without the need of special equipment. It is manufactured for use in daylight and tungsten light.

Kodacolor roll film and prints were announced in January. Kodacolor is a process by which colour negatives can be made in ordinary roll film cameras and printed to give colour prints on paper. The finishing is done by the manufacturer, because best results cannot be obtained without proper chemical and photographic control. The Kodacolor process resembles Kodachrome in one sense, in that the film is coated with three layers which respond to blue, green and red light. It differs, however, in two fundamental respects. In Kodachrome the colours are formed by using special developers in which the dye-forming couplers are dissolved. In Kodacolor the couplers are actually incorporated in the sensitive coatings of the film. They are dissolved in minute droplets of organic material which is dispersed in the emulsions. Further, Kodachrome is developed by the reversal method to give a positive transparency, while Kodacolor is developed directly to give a film negative, and this is then printed onto a paper coated in a similar manner to give coloured prints.

Minicolor prints 8X were made available, in addition to Minicolor prints 2X and 5X previously announced. Minicolor prints in sizes up to 30x40 in. were furnished on special order. Minicolor prints were made from 35-mm. Kodachrome originals on white pigmented cellulose acetate support coated with Kodachrome emulsion.

Pan-Chroma-Relief film was an entirely new product intended for producing imbibition matrices for making colour prints from positive colour transparencies, such as Kodachrome, or complementary colour negatives, such as Kodacolor, without the use of intermediate separation negatives or positives.

The same material served the dual purpose entirely satisfactorily when processed with radically different techniques. Briefly, working from positive transparencies the Pan-Chroma-Relief film is exposed emulsion toward light source, developed and the silver gelatin image etched out by a special peroxide solution, thus giving positive from a positive.

Working from a negative in complementary colours, the film is exposed base toward light source, developed and the silver image turned into a relief by hot-water treatment, giving a positive from a negative. The colour prints are then made by the methods familiar to all workers in imbibition or wash-off relief processes.

Special tricolour gelatin filters were worked out for this product which required an approximate 1:1:1 exposure ratio when a standard enlarging bulb was used.

Kodachrome continued to be the most widely used colour film, with increasing use in the military and industrial fields. By the end of 1942 priorities and military demands showed that it would be increasingly difficult for the ordinary consumer to get Kodachrome film.

Microphotography.—Within the previous two to three years the technique of microphotography permeated many phases of business and industry and likewise achieved an important place in scientific and cultural work. As a technique, it achieved a high status of mechanization and, like the photocopying or photostat machine, it became not an end in itself but rather a means to an end, or in other words, a valuable tool for many diverse types of work. Significantly enough, all of the large film manufacturers in 1942 provided two or more specialized emulsions designed for use in microcopying. Microphotography reproduction in full colour, with the exposures made and film processed in any ordinarily well-equipped laboratory, was a reality. Equipment manufacturers developed highly-mechanized semiautomatic an automatic cameras, special film printers and continuous processing machines modelled somewhat after those used in the motio picture industry but fitted with precision controls and other devices required for processing microphotographs. A large numbe of continuous automatic enlargers, capable of reproducing enlarged paper facsimile prints from negative microfilms on a production line basis, were manufactured largely for use with th V-mail or "soldier's mail" program. These are also applicable t other projects.

In response to existing demand, general purpose equipment wa superseded to some extent by specialized machines intended fo particular applications. Coincidentally, however, a particularl successful attempt was made to bring low-cost simplified equipment within the reach of the average individual. A small microfilm reading machine was available in 1942 which cost no mor than a typewriter. The microprint process, wherein 100 pages o text are placed on a sheet of paper no larger than an ordinar book page, gave promise of becoming a popular publicatio method so that a library of 10,000 volumes in microprint for together with a reading machine would occupy a space no large than an ordinary office desk.

Under the direction of the committee on scientific aids t learning, the Spencer Microfilm Reader was made available. Th was designed to fill the low-priced market and yet give goo optical results.

In the federal government microphotography became an accepted method of records control in administration. By law (5 Stat. 958) microphotographic copies prepared in the prescribe manner must be judicially noticed and might replace origina documents that had been destroyed. Special courses of instruction in microphotography were being given in at least two larg universities (Chicago and Columbia) for technicians and administrators.

V-Mail.—In April 1941 the British adopted the Airgraph system to solve the problem of getting mail to and from the force in the near east. In 1942 the system was put into operation fo the American forces, scattered over the world, under the nam of V-mail. The process was worked out by the Eastman Koda company, originally with the object of using it for the rap transit of mail by aircraft in peace time. Arrangements wer made for its operation with Pan American Airways and Britis Overseas Airways, and when war came the service was offered t the American and British governments. The method employe is to write a letter on a special sheet of paper. This is photographed on a 16-mm. film and flown in this form to its destination. There it is enlarged onto a sheet of paper, folded, sealed i an envelope and sent to the addressee. Eighty-five thousand letters, which would normally weigh about 2,000 lb., weigh only 2 lb. in film form.

Still another important development in the copying field wa the continued use of reflex copy paper. Kodak put their produc on the market during 1942. This photographic paper is used b placing directly in contact with a book page or other materi and then a light is turned on and the exposure is made directl through the back side of the reflex copy paper.

Agfa Direct Copy film was introduced by Agfa some years ag and had found wide application for duplicating negatives or positives in one step. A new Direct Copy film was made availab which has greater speed and more latitude. The new film can b more universally used and is less critical in regard to exposu and darkroom handling than the product formerly made.

Sensitized Translucent Waterproof Paper.—Several attempts to introduce such a material as a negative medium ha been made in the past. They were unsuccessful, however, du her to deficiencies in the base paper or to prohibitive cost. In the latter part of 1941, the Defender Photo Supply Comny, Inc., in co-operation with an American waterproofing firm, ceeded in developing a satisfactory and moderately priced oduct which was made commercially available and which found reasing acceptance as a supplement to conventional film negaes in planographing, duplication of blueprints, and diazotypes, otographic reproduction of pencil and ink tracings, auxiliary atives in template processes, etc. Chief advantages as comed with film products are resistance to tear, low shrinkage and etch, and moderate cost.

Photographic Lighting.—Probably the most important deopment in 1942 as regards photographic lamps and in fact all es of light sources was the simplification and limitation of lamp es imposed upon the industry by the War Production board's p order L-28A. By the end of the year photolamps were ainable only by various government branches, including the itary, and publishers, such as newspapers and periodicals. At end of the year no provision was made for releasing lamps to mercial photographers.

This curtailment of photographic lamps included all flash ps for civilian use. Until after the war flash photography for general public was to be suspended.

ne of the most significant developments in the field of flash tography was the production of the Ilex built-in-shutter flash chronizer mechanism. Cumbersome flash synchronizer atments were, normally, mounted on the camera body and out camera shutters. With this new Ilex synchronized shutter, rything is built right into the shutter mechanism. Electric rent is drawn only for igniting the flash lamp. Time delays n zero to about 23-milliseconds can be set as quickly and ably as the speed of the shutter. This range covers all avail lamps, such as the Kodatron Speedlamp, the SB bulb and standard flash bulbs. It was the first synchronizer made ilable for universal use.

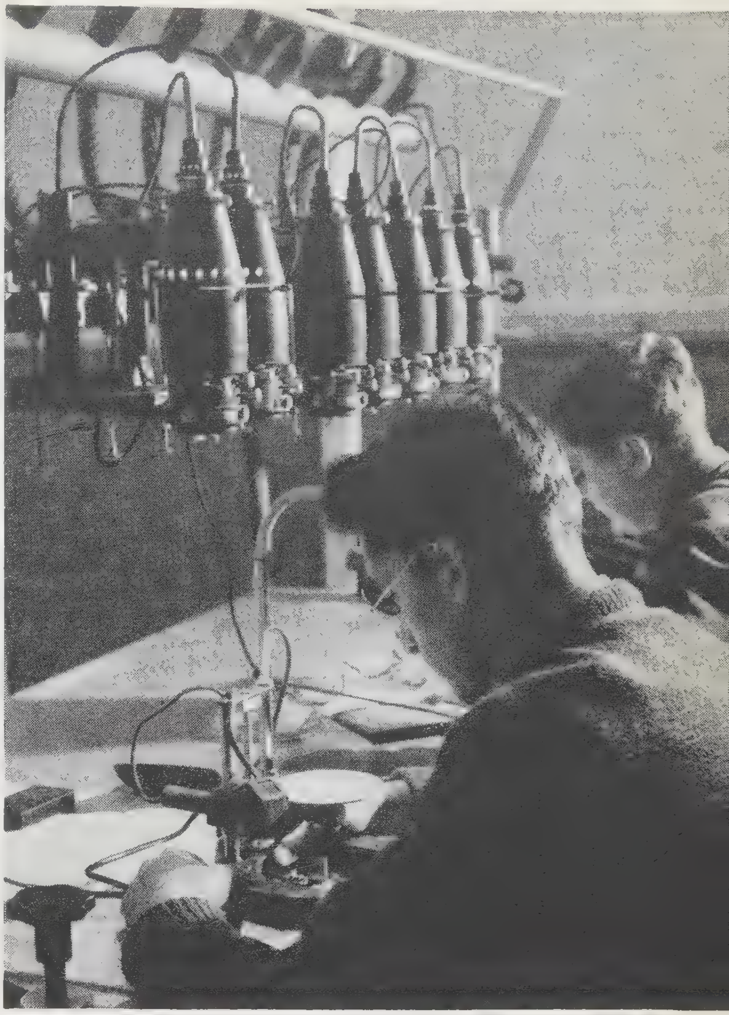
light aerial photography by flash bombs in the military field continued on a greater scale. This work was greatly accelerl by the introduction of new aerial films of extremely high ed and new lenses of high aperture, particularly one of 12-in. l length and an aperture of f./2.5 containing the new Kodak s.

Miscellaneous Developments.—In 1942 Defender embarked n the commercial manufacture of optical gelatin filters. Two s were offered: namely, conventional and lacquer-coated rs. The latter variety is a noteworthy improvement over viously obtainable filters, due to their resistance to adverse ospheric conditions and ruggedness against wear and tear se.

uring 1942 Defender concluded experimental work resulting water-resistant basic paper stock which, suitably sensitized, be used for aeromapping and quick finishing, such as reed in aerial reconnaissance. A new type waterproofing layer, eved to be superior in water and moisture resistance as well exibility over conventional nitro and acetate cellulose lacquers, used in the manufacture of this product. This was available to the armed forces.

mong the new lenses brought out during 1942 were the Kodak ra lenses in focal lengths of 8½ in., 10 in. and 12 in., suppleting the earlier 14-in. Ektra. The Eastman High Speed nera, Type 3, for making 16-mm. high-speed motion pictures o 3,500 frames per second was another significant developt of the year.

odak fluorescent water colours were introduced. They were ially designed for the use of commercial artists and illusors in the making of sketches to be reproduced by photomechanical methods in which colour correction is applied photographically.



TO GIVE AERIAL PHOTOGRAPHS a third dimension and thus locate contours, U.S. army engineers use a special multiplex machine

The Kalart company produced its new Model E De-Luxe camera range finder exclusively for military use. Also this firm introduced the Focuspot, a light beam focusing device that is projected through the range finder to facilitate quick focusing camera adjustments.

The Ansco-Sweet Densitometer was described in various scientific journals. A few instruments were made available for defense and government agencies.

The Mallinckrodt Chemical Works placed the production of ammonium thiosulphate on a commercial basis in a purity suitable for photographic work. This chemical may be used in place of hypo (sodium thiosulphate). Ammonium thiosulphate gives a faster working solution for ordinary negative development such as certain types of aerial reconnaissance as well as in the industrial field. The expanding use of X-ray methods of inspection of castings produced another demand for more rapid processing of the X-ray film. X-ray developer and X-ray fixer in concentrated liquid form were made available as Liquadol and Liquafix.

The Electron Microscope.—During 1942 electron microscopy advanced in two directions—a great increase in the number of centres of microscope research, and a broadening of the scope of the electron microscope by the application of new procedures and accessory apparatus. RCA electron microscopes were in operation in various laboratories and hospitals in addition to a few privately constructed ones. Many original observations and discoveries resulted from electron microscope research. However, these findings were not made public for military reasons. The electron microscope is finding many new uses in the entire photographic field. This equipment will undoubtedly be included in many new research departments and photographic laboratories in the future.

In the bacteriological field, the study of bacterial morphology and bacterial reactions—in particular reactions of bacteria and their antibodies and "staining" effects of heavy-metal salts—were carried further. Certain bacteriophages (parasites of bacteria), once believed to be macromolecular in nature, were shown by Drs. S. E. Luria and T. F. Anderson to consist of head and tail, the former with a characteristic granular structure. A definite complex structure could also be demonstrated in the case of the elementary bodies of the virus of vaccinia (cowpox), suggesting a closer relationship to bacteria than to the truly molecular plant viruses such as tobacco mosaic virus.

In the study of relatively thick specimens, such as biological sections, progress was made possible by the use of electrons accelerated through very high voltages—up to 300 kv. Thus Drs. A. G. Richards and T. F. Anderson were able to shed new light on the structure of insect cuticle and of insect tracheae or air tubes. Stereoscopic pictures, obtained with a special specimen holder, aided considerably in the interpretation of the observations

In the chemical field, the possibility of using the RCA electron microscope as a high-precision electron diffraction camera added greatly to its utility. A specimen which has been observed in regular fashion may be quickly transferred to a second position in the microscope, where it gives rise to an electron diffraction pattern. For finely divided material the latter, recorded on a photographic plate, consists of a series of concentric rings, whose diameters are determined by the separations between the atoms, or by the crystal structure of the material. Thus the diffraction unit performs a microanalysis of the specimen observed in the electron microscope.

Finally, the electron microscope was adapted for surface observation, essential in metallurgy, in two different manners: (1) by the preparation of very thin plastic replicas of the surface to be studied which are then examined in the standard instrument by transmission, and (2) by the development of a "scanning electron microscope" for the direct examination of surfaces. The latter combined the techniques of electron microscopy and electric picture transmission (facsimile) to obtain greatly magnified recorded images of surfaces.

The standard electron microscope, recently redesigned, was found to have an optimum resolution of the order of 30 angstroms, corresponding to a useful magnification of 100,000. A much smaller electron microscope, operating on similar principles, was developed. With a microscope column measuring only 16 in. in length, versatility and high initial magnification were sacrificed to compactness.

Physics.

It used to be difficult for some competent physicis to find positions in which they could use their abi ties to the full. In 1942, the situation was reversed. Governme departments and laboratories, industrial organizations, the arm forces, colleges and universities were all prepared to employ phy cists if they could be found. Physics went to war. The first n tional committee, designed to advise local draft boards concer ing the deferment of essential workers, was set up in Washingt to ensure that the current supply of physicists be conserved, a to ensure that physicists-in-training would, later on, be locat in positions where they could give the greatest help to the w effort. Circumstances drew physics and physicists out of secl sion to play a key role in the war. A necessary consequence this change in the national position of physics was that most cu rent research was of a confidential nature, whose immediate di closure would be inimical to the best interests of the countr The developments which are summarized below therefore deal, the main, with special aspects of research programs which we initiated several years ago, and upon which work had in 19 practically ceased.

Thermal Diffusion.—Several methods of separating isotop had been tried in the previous 20 years. Of these, the mo promising was that involving thermal diffusion. This phrase d scribes the process whereby, in a mixture of gases, a temperatu gradient creates a concentration gradient, making the lighter pa ticles more numerous in one place than another. A separati of the light and heavy components is thus theoretically possib The theory of the phenomenon is not simple, and the mathema cal predictions, which must be based on some arbitrary but reaso able assumption concerning the forces between molecules, do n give much more than a qualitative agreement with experimen One interesting point in the theory is that if the force between pair of molecules be taken as proportional to the inverse fif power of their distance apart, then a temperature gradient in gas mixture does *not* create a corresponding concentration grad ent. Hence the fact that isotopes can be separated implies tha

THE 4,900-TON CYCLOTRON of the University of California at Berkel Calif., was turned to military uses in 1942 the theory be correct, the forces between molecules do not y with distance in quite the way this simple inverse power suggests. In spite of the many defects of the theory, the cess of thermal diffusion is, in practice, an effective sepa- or of isotopes. Clusius and Dickel, whose work was mainly ponsible for the renewed attention given to the subject, used nultiple-tube unit with an effective length of 36 metres, and ained from ordinary hydrogen chloride samples which con- ned about 99.5% of the light (35) isotope of chlorine, and ers which contained the heavy (37) isotope to the same de- e of purity. The case of chlorine happens to be a fairly easy , for the two stable isotopes differ by 6% in mass, and occur urally in comparable amounts—actually almost in the ratio ee to one. Since thermal diffusion occurs also in liquids, it expected to be used by those who seek to develop practical rces of atomic energy in an effort to separate the remarkable isotope from ordinary uranium.

he Nucleus.—The laws of conservation of energy and of mentum are so well established that physicists are unwilling admit their failure even in nuclear processes. Several years , a study of the beta ray spectra of radioactive elements ught to light an apparent violation of these laws. But rather n admit their failure, Fermi invented a new particle, the trino, which he assumed took part in beta ray disintegration, such a way as to permit the two laws to remain valid. The blem thereafter was to detect the neutrino, for the properties ch the theory demanded of it were nearly all negative. It ded no mass, in this respect resembling the photon; it needed charge, like the neutron; it needed no magnetic moment; it ded a spin of one-half. The only feasible way of detecting it by the recoil it gave to another particle, for, like the photon, an carry momentum.

he experiments designed to detect the neutrino had been ewhat inconclusive. New experiments by J. S. Allen were h more clean-cut. He chose a reaction in which only one r particle, a Li^7 nucleus, was involved, which carried away the momentum of the neutrino. Actually, he was able to de- the recoiling Li^7 nuclei as positive ions, a condition in which were reasonably easy to handle. These Li^7 ions, flying along vacuated tube, were controlled by a retarding potential, which n large enough, prevented the ions from reaching an amplify- device. Hence, when the current generated by the amplifier reduced to zero, it was considered that the retarding potential large enough to turn back the fastest of the ions. From , the velocity of the ions could be calculated, and hence the nentum carried away by the neutrino. Allen found that 30 tron volts represented the energy which the Li^7 ions gained n the neutrino. This information, by itself, does not deter- e uniquely the properties of the particle. It does not, for ance, guarantee that its mass is zero. Indeed, if the mass e as large as one-fifth of that of the electron, Allen's experi- t would have been unable to tell the difference. Although in respect the result is inconclusive, the experiment increases ormously the probability that the neutrino really exists.

Cosmic Rays.—The most interesting new development was tained in a paper by Millikan, Neher and Pickering, who co- nated the results of a world-wide survey extending over sev- years to arrive at a new hypothesis concerning the origin he rays. Experiments showed that cosmic rays do not come n the stars, but from a much more uniform distribution of rces in the nearby universe. Yet the energy which cosmic carry is so great that no other process save atomic annihila- can provide it. Millikan, Neher and Pickering assumed that rays arise during the annihilation of atoms in interstellar ce, giving rise to charged particles of some kind, and proceed to test this theory as far as they can. The most common atoms in space (which is not quite, though nearly, devoid of matter) are hydrogen, helium, carbon, nitrogen, oxygen and silicon, which occur approximately in the ratios 100, 10, 1, 1, 1, 1. There were good reasons for believing that the radiations from hydrogen annihilation are too weak to penetrate to the earth through the screening magnetic fields of the earth and sun, but the heavier atoms mentioned can produce annihilation radiation capable of reaching sea level at certain parts of the earth. The exact process by which the annihilation occurs is not known, but the energy is calculable in each case, being due merely to the disappearance of mass and the appearance of another form of energy in accordance with a well known equation set up by Einstein. From current knowledge of the earth's magnetic field, it can be predicted that the radiation from silicon could be observed all the way from the equator to the magnetic poles. The weaker radiations from the other elements, being more easily deflected, can be observed from the poles only as far as certain latitudes which are determined by the particular energies in question. Hence, in proceeding northward or southward from the equator, plateaus should be discernible on a graph showing the varying cosmic ray intensity as a function of latitude. This is exactly what the world-wide survey showed. It had not been possible to date to test the theory quantitatively with any great precision, nor to relate it closely to other types of cosmic ray theory. It gives little information as to the nature of the primary particles or their absorption in matter, but it will serve as a good qualitative hypothesis until more experimental results are available.

X-Rays.—The focus of interest in 1942, as it was in 1941, was the interpretation of the anomalous diffuse spots which are found in the diffraction patterns of crystals. Raman and his school in India still maintained that they are due to a quantum phenomenon analogous to the optical Raman effect, while the majority of workers in other English-speaking countries believed that no quantum phenomenon is involved. Be that as it may, something very useful was emerging from the work. As Lonsdale hinted nearly two years previously, the diffuse spots are very closely related to the elastic properties of the crystal. The original theory of Waller concerning the heat motions of atoms in a crystal was extended by Jahn in such a way as to connect the appearance and size of the spots with the elastic constants of the crystal. The pattern for tungsten, a highly elastic metallic crystal, is sharp and small, whereas those for sodium and lead are fuzzy and spread out. Measurements of such patterns are in good agreement with Jahn's calculations. The importance of the work lay in the fact that it promised to open up a new method of determining the elastic constants of a substance without bending or twisting it. (*See* also X-RAYS.)

Active Nitrogen.—This form of nitrogen can be created by certain types of electrical discharge. It glows with a yellowish light which persists for a long time after the excitation ceases. First discovered in 1900, its exact nature had been a mystery. But thanks to a fine series of experiments by Lord Rayleigh, and a neat summing up by Debeau, the main details of its behaviour were established. Rayleigh first found by photometric measurements that only about one molecule out of every 1,000 in a volume of strongly activated nitrogen actually gave out radiation. What, then, were the other 999 molecules doing? In his most recent series of experiments, he observed that pieces of metal foil immersed in active nitrogen were raised to incandescence or were even melted. By measuring the power emitted from the foil in the form of temperature radiation, he was able to deduce that the energy concentrated on the foil was so large as to require *every* molecule in a volume of active nitrogen to transport some 5 or 10 electron volts of energy to it. This suggested that active nitrogen is almost completely dissociated. The finishing touch was applied by Debeau at the University of California, who proved, by repeating an old experiment of J. J. Thomson's, and by some new experiments of his own, that active nitrogen is really in the atomic form. He then interpreted the subsequent behaviour of the gas so as to account for the observations of Rayleigh. It appeared very probable that the first step in the return of active nitrogen to the normal form is the formation of a "collision complex," a grouping of two atoms in a manner different from the ordinary molecular binding. This collision complex can return to the ordinary form of molecular nitrogen by one of two paths. Either light is emitted, or else the excess energy is given up in the form of heat at a suitable surface in the gas. The former occurs only about once to every thousand of the latter. Hence, from the point of view of energy, the glow of active nitrogen, on which most of the experimental work has been done, is almost insignificant.

Other topics of interest were the scattering of protons and neutrons by nuclei, and the behaviour of ions and electrons in crystals, particularly in their application to photoconductivity and the photographic process. A useful summary and brief bibliography of physics in 1942 were given in the *Journal of Applied Physics*, Feb. 1943. More detailed information and references to related research in foreign countries can be found by working from the indexes of the *Physical Review*, vols. 61 and 62.

(T. H. O.)

Physiology.

Treatment of Shock and Haemorrhage.—The most important single feature in the treatment of both wound shock and haemorrhage is restoration of the blood volume. In haemorrhage, whole blood is lost from the body; in wound shock, blood plasma (whole blood minus the blood corpuscles) is lost into the tissue spaces. It was found that the replacement of the blood volume is much more important than the replacement of red blood cells, even after extensive haemorrhage. This fact is of military importance because whole blood is perishable, and difficult to transport and store, whereas blood plasma is capable of long storage and easy transportation in the liquid, frozen or dried state. Dried human plasma was adopted as the official blood substitute by the U.S. army and navy. The navy also used dried human albumen (one of the blood proteins). Experiments were carried out in regard to the possible use of bovine or horse serum albumen as a blood substitute for human use. This would supply a cheap and unlimited source. However, a product sufficiently pure and non-toxic was not prepared. The army and navy require about 2,500,000 pints of blood yearly for the production of dried plasma during the present emergency.

Nerve and Muscle.—The events which transpire at the neuromuscular junction have long been of interest to physiologists. Each voluntary muscle fibre is supplied by a motor nerve filament which terminates upon the muscle fibre in a specialized structure known as the motor end plate. Excellent photomicrographs of these motor nerve endings were obtained. It was found that the motor end plate expands when the muscle fibre contracts, and retracts when the muscle fibre relaxes. The demands of increased functional activity appear to produce an expansion and extension of the motor end plates by active ameboid motion. This increase in surface of the end plate may favour transmission of the nerve impulse to the receptive substance of the muscle. These findings were interpreted as favouring the chemical theory of neuromuscular transmission. During starvation, the motor endings expand and finally appear to become separated from the muscle fibres.

The fact that an increase in acidity causes a marked accentuation in after-discharge phenomena (*i.e.*, a muscle continues to respond after the stimulus is removed from the nerve) fits in well with the chemical theory of synaptic transmission. It was thought that the increase in hydrogen ion concentration prevents the d struction of acetyl choline and thus allows its accumulatio Acetyl choline was thought to be the chemical mediator in neur muscular transmission. Acid-neurohumeral interplay may infl ence all physiological processes and also pathological manifest tions where acetyl choline is involved, *e.g.*, mountain sicknes tetany, coma, etc.

Vitamins.—The relationship of vitamin deficiency to gray ha received considerable attention. A deficiency of pantothenic ac (a member of the vitamin B complex) was found to cause gra ing of the hair in experimental animals. This could be co rected by the administration of pantothenic acid. A lack of th substance was also found to cause a loss of pigment in chic feathers. Some claimed that para-aminobenzoic acid would al darken gray hair in rats and in human beings. This was denie by others. The ratio between the para-aminobenzoic and pant thenic acid present in the body may be the important factor, relative increase in the former promoting graying of the hai Some believed that para-aminobenzoic acid stimulates the grow of certain intestinal bacteria which destroy pantothenic acid.

Studies indicated that a deficiency in certain members of th vitamin B complex may cause high blood pressure in the rat. was suggested that the vitamin deficiency blocks the action certain enzymes which are essential to make oxygen available the kidney cells. Massive doses of vitamin A were reported lower the high blood pressure produced by renal ischemia in th dog. (*See* also VITAMINS.)

Radioactive Elements.—By the use of radioactive carbo atoms produced in the cyclotron it was shown that animals utili carbon dioxide in metabolism. It had long been known that pla cells use carbon dioxide in the synthesis of carbohydrates, b this was not known to occur in animal cells. It was shown, how ever, that pigeon liver tissue utilizes carbon dioxide in the sy thesis of certain complex organic compounds related to the carb hydrates and perhaps also to the proteins.

Aviation Physiology.—The effect of exposure to altitude o the human body received an immense amount of investigatio during 1942. Much of this investigation was of a confidenti nature The problems of greatest importance and regarding whic important discoveries were made may be enumerated as follow (a) The development of oxygen supply equipment and oxyge masks and helmets; (b) The study of factors which increa tolerance to oxygen lack; (c) The incidence of the symptoms decompression sickness in aviation cadets (the cause and preve tion of such symptoms as the "bends" and "chokes" is of muc importance and progress has been made); and (d) The amelior tion of the "blackout" or loss of vision and later the loss of co sciousness which occurs when an aviator makes a sudden turn high speed.

tsburgh. Tenth largest city of the United States; Pittsburgh, Pa., had a population of 671,659 by the eral census of 1940. It is in the southwestern part of Pennsyl- ia, at the junction of the Monongahela and Allegheny rivers. a, 54,295 sq.mi. (excluding rivers). Mayor (Jan. 1, 1943): nelius D. Scully.

he story of Pittsburgh in 1942 was one of industry geared to t the demands of modern warfare. Steel mills raised their ot production to the all-time high of more than 20,000,000 . The Westinghouse Electric & Manufacturing company de- red in 1942 some $500,000,000 worth of apparatus, practically of it for war work. This output was about 35% ahead of the esponding production for 1941. The Aluminum Company of erica nearly completed in 1942 its $250,000,000 expansion gram. Industrial payrolls for 1942 were more than 230% ve those of the boom year 1929, and upwards of 100,000 more ons were employed. Production for civilian consumption was minimum, as was shown by a drop of 50% in the production plate glass.

n addition to supplying the materials of war, Pittsburgh was re, in 1942, of its responsibility for providing the funds for prosecution of the war. During the Victory Loan drive in . 1942 Pittsburgh and Allegheny county subscribed $274,000,- $4,000,000 more than the quota assigned to the district. er the leadership of H. J. Heinz II, Pittsburghers contributed 00,000 to the United War fund, $300,000 more than the quota

our major flood control dams in the district, constructed after disastrous St. Patrick's day flood of 1936, did not entirely eed in preventing a flood stage of water in the rivers late in . 1942. For a brief period some of the plants located along banks of the Monongahela, Allegheny and Ohio rivers were ed or had their production hampered by a crest-stage of ft. (J. G. Bo.)

s XII (1876–), the 262nd successor to St. Peter in the See of Rome, was elected pope by the assembly ardinals on his 63rd birthday, March 2, 1939, and was en- ned on March 12. (For details of his early life, see *Encyclo- ia Britannica.*) As pope he is held to be the vicar of Jesus st on earth, and his spiritual power extends over an estimated 000,000 Catholics scattered throughout the world. These to be found in 1942 in all the warring nations, and his con- for them was universal, regardless of their racial or civil iance.

in preceding years, the pope's words and actions in 1942 directed solely toward the attainment of peace in a war-torn d, but a peace founded on justice and charity. His policy as poral ruler of the independent Vatican City state continued to hat of the strictest neutrality; nevertheless, his denunciations ie evils of totalitarianism and his assertion of the inviolability uman and divine rights and liberties continued with redoubled e.

is propagandists endeavoured to make capital over the estab- nent of diplomatic relations between the Holy See and Japan, it was explained by Radio Vatican that these relations were established at the request of Japan. In an address to the men of Italian Catholic Action the pope said that the new order sought by the fascists was not in reality a new order.

On Dec. 8, 1942, the pope officiated in St. Peter's at a ceremony of expiation and intercession, praying for world peace. The Immaculate Conception of the Blessed Virgin was designated as Patroness of the Military Ordinariate of the United States. St. Albert the Great was proclaimed Patron of the Studies of Natural Science. In May the pope called the world to prayer for peace. He celebrated his silver jubilee of episcopal consecration May 13.

The pope granted the following unusual permissions in 1942: He renewed the permission given for the midnight mass to be offered on the afternoon of Christmas Eve where blackouts prevailed; he granted to bishops the right of dispensing their subjects from the rule of fast and abstinence for the duration of World War II; he granted permission to military chaplains at the front to offer mass without the usual altar stone. In July the pope sent $40,000 for relief of Malta and later $20,000 for reconstruction of bombed churches. In a letter to the English bishops the pope said: "We stand horrified before the spectacle of the growing violence and fury of this war." On Dec. 8 the pope read the prayer of consecration to the Immaculate Heart of Mary, and afterwards imparted the papal benediction from the loggia of St. Peter's.

On May 12, 1942, eve of the silver jubilee of his episcopal consecration, the pope made a broadcast to the world, and a plea to the warring nations. On Sept. 27 he broadcast in Portuguese to the Fourth National Eucharistic Congress of Brazil at São Paulo, in which he included a special prayer for Russia. On Nov. 1 he broadcast in Portuguese on the anniversary of the Apparition of the Blessed Virgin Mary at Fatima, consecrating the world to the Immaculate Heart of Mary. On Nov. 26 he broadcast in Spanish to the Eucharistic Congress at San Salvador, voicing a prayer for peace among men.

On Dec. 24, 1942, the pope's Christmas message was broadcast to the world. He denounced totalitarianism, insisted upon the need of a juridical order for society and co-operation between classes. He assailed the peril of the godless state, and added five fundamental points for the order and pacification of human society: respect for the human person and human rights; integrity of the family; honour for labour; restoration of the juridical order; and an ethical basis for the state. (*See* also ROMAN CATHOLIC CHURCH; VATICAN CITY STATE.) (J. LAF.)

Plague, Bubonic. Plague infection of man was reported during the first nine months of the year[1] in Africa, Asia, Asia Minor and South America, and among field or domestic rodents in Alberta, Canada, and in the United States, including the Territory of Hawaii, from which 82 infected rats were collected during this period. More than two-thirds of 2,127 reports of human cases originated in Kenya, Uganda, Madagascar and Morocco.

The epidemic which prevailed in Nairobi during 1941 abated during Feb. 1942 after 354 patients died among 547 who were hospitalized; 431 of the latter were bubonic cases and 131 were septicaemic or pneumonic. Health officers of Kenya used Dagenan 693 (sulphapyridine) as treatment of 693 patients and observed that 12% died after administration of large doses early in the course of the disease and 87% died among those similarly treated during its later stages.

In view of the endemicity of plague among various field rodents of western United States the federal government continued its surveys by mobile field laboratories, and in an effort to determine the eastern boundary of the infection among rodents collected approximately 85,000 of 26 genera between the 100th and 105th meridians, west. No infection was found although susceptible rodents abound and harbour parasites whose capability as vectors was experimentally proven. New foci of infection and recrudescence of old foci occurred throughout California and in Nevada. The disease was found for the first time in Oregon west of the Cascade mountains in ground squirrels (*Citellus douglasii douglasii*), and probably represented an extension from that detected during 1941 in the northern counties of California.

---

[1] Reports for the last three months of 1942 were not received, or not published.

Infected fleas were collected on two occasions from rats trapped on the waterfront of Tacoma at an establishment visited by foreign shipping. Plague was not found previously in this port.

Collections from 13 of the western states included one or two species of rats (*R. Alexandrinus, R. rattus rattus*) in addition to the Norway rats (*R. Norvegicus*) from each of six states. Eighteen species of fleas were taken from the rats aside from the three which usually infect those animals in the United States. Seven of the 18 served as vectors under experimental conditions.

Manoeuvres and encampments of military forces in areas which are sparsely settled and in which the disease is endemic amongst rodents necessitated the prosecution of measures to reduce the probabilities of its dissemination to man by destroying rodents in and around the military and civil communities.

Plant Industry, Bureau of.

Comprising only two-tenths of 1% of the corn belt corn acreage in 1933, hybrid-corn acreage grew to 13% by 1937 and then rose to 26% in 1938, 39% in 1939, 52% in 1940, 65% in 1941, and 72% in 1942. Grown on only about 144,000 ac. in 1933, it was used in 1942 on about 41,000,000 ac. Its wartime importance is indicated by the calculation that use of hybrid seed added 300,000,000,000 bushels to the 1942 corn crop, enough to produce about 3,300,000,000 pounds of pork—about half the total tonnage of red meats estimated as needed in the 1942 marketing year for military and lend-lease uses.

An example of plant-science mobilization to solve wartime problems was the corn breeders' development of a substitute for the tapioca starch no longer available from the orient. Secret of this success was the hybridizing of American corn with a waxy corn with starch similar to that of tapioca, through procedures similar to those followed in developing hybrid corn. The original waxy corn came to the department of agriculture from a missionary in China and was for years grown mainly as a curiosity. In 1936, hybridizing experiments began, and when the war came these were accelerated to such an extent that in 1942 a waxy corn crop was raised on 326 ac. for trial by commercial mills. Production of seed for future crops was so intensified that the 1942 seed crop was expected to make possible the planting of 60,000 ac. of the commercial crop in 1943, which was expected to produce more than 2,500,000 bushels of waxy corn. Of even greater importance, the 1942 preparations were to make possible the 1943 planting of 3,000 ac. for seed to be used for the 1944 commercial crop.

Other crops in which great development was achieved as a result of the work of the bureau of plant industry and its co-operators in 1942 included soybeans, tomatoes, peas, beans, corn, sugar beets, forage crops, guayule and other rubber-producing plants, sugar cane, sorghums, drug plants, castor beans, and hemp to replace the abaca, or manila hemp, formerly imported from the far east. (*See* also FERTILIZERS.)

The bureau of plant industry played a prominent part in efforts to increase the planting of legumes for winter cover crops in the South as a means of adding to the nitrogen content and fertility of crop lands and participated in nationwide efforts to increase gardening at home, promoting victory gardens both on farms and in small city and suburban areas.

Research with plants is concerned with reducing production hazards and improving the quality of crops. One of the principal ways of doing this is by breeding new strains or varieties that are resistant to diseases, heat, cold or drought. Many of the new forms result from the foreign exploration work of the bureau and the domestic introductions that follow. Efforts to control plant diseases involve studies of the causative organisms and their life histories and a knowledge of how they are spread to new territory. Other studies are concerned with weed control and methods of planting, harvesting, transportation and storage of crop plants.

In 1942, the bureau maintained experimental farms, greenhouses and laboratories at its Beltsville, Md., headquarters, conducted research in co-operation with all the state agricultural experiment stations, and administered the National arboretum at Washington, D.C. During the 1942 fiscal year it contributed 14 new publications to the department of agriculture series, and in addition members of the bureau contributed about 600 articles to outside scientific, agricultural and commercial publications.

In connection with a reorganization of the department of agriculture for more effectiveness in the war, the bureau of plant industry was included in a newly established Agricultural Research administration, and its former chief, E. C. Auchter, was made administrator. Effective April 9, 1942, Robert M. Salter was appointed chief of the bureau, its sixth head since the agency was established in 1901. (H. Z.)

Plasma: *see* PHYSIOLOGY.

Plastics Industry.

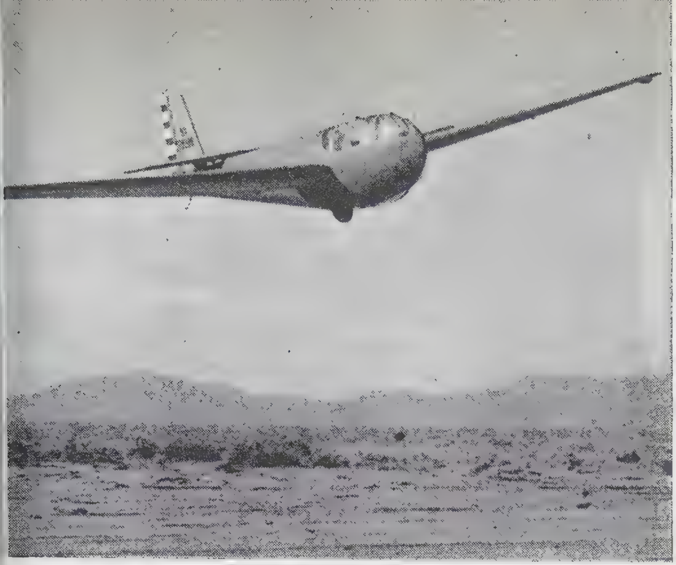
Production figures from enemy countries were not available, nor from Allied Nations, but based upon United States figures, the 1942 world production of plastics and plastic resins was estimated to have reached the staggering figure of 1,000,000,000 lb. Estimates placed the value of plastics in the United States in 1942 at more than $450,000,000. Reasonably accurate figures for the production of plastics and plastic resins in the United States for 194 showed approximately 500,000,000 lb. with a value of $160,000,000.

It is difficult to say in what field plastics were of greatest value in the prosecution of war but it is certain that in aircraft construction a great deal of aluminum was saved and much plastic was used where no metal was suitable. It was conservatively estimated that the average aeroplane contains about 200 plastic parts, mostly phenol or urea formaldehydes.

With the above resins as bonding adhesives, large quantities of plywood were used in wings and fuselages in trainer planes, in pulleys, gears, instrument parts and interior fittings. Another important and ingenious replacement was that of aeroplane engine parts previously made of sheet aluminum. These were made of cotton impregnated with phenol formaldehyde and moulded into the desired form.

Moulded phenolics, usually strengthened by fabric fillers, found extensive use in range finders, oil pump bearings and propellers. Various parts of machine tools applied to aircraft making were also made from moulded phenolic.

The use of acrylic resin in the form of methyl methacrylate which had already found wide application in aeroplanes was greatly extended. This material became practically indispensable as the transparent sheeting for forming bomber noses, turret tops, domes, cockpit enclosures and other special equipment. It protects the pilot and crew from the weather and the rushing wind and at the same time enables them to enjoy complete vision i



E FIRST ALL-PLYWOOD PLASTIC GLIDER landing after a test flight near Angeles in 1942

STIC HOSE NOZZLES were another example of metal replacement in 1942. outer sleeve and nut are made of ethocel; the nozzle end and tip of styron

BOMBER NOSE of lucite, a methyl methacrylate plastic

AIRCRAFT RADIO BATTERY CASE fabricated of styron in 1942

all directions.

In addition to aircraft applications, many other war and essential civilian needs were supplied. For example, plastic-bonded plywood was used for helmet liners, warship steering tubes and pigeon crates. Phenol formaldehyde was made into washing machine agitators, electric fans, water meter disks, school desks and chairs.

The vitally important application of nylon as replacement for the silk formerly used in parachutes, while not strictly a plastics application was well supplemented by the use of nylon monofilament in aeroplane engine polishing brushes, paintbrushes for the army and navy, surgical sutures and other essential bristling applications.

Cellulose acetate butyrate, because of its resistance to moisture, enjoyed a large market with an estimated United States production of 7,000,000 lb. This thermoplastic resin, as well as cellulose acetate, found application in many aircraft parts where the strength of fabric-filled phenol formaldehyde was not required. Cellulose acetate in the form of transparent sheeting was used in glider and motorcycle windshields, windows for blimps, and because of the scarcity of methyl methacrylate, acetate was used for the transparent enclosures of trainer and observation planes and in many auxiliary and secondary construction points.

The application of styrene to the manufacture of synthetic rubber started the construction of styrene plants with a capacity of over 200,000 tons per year. These plants were not producing to any great extent in 1942 and consequently a considerable portion of styrene normally available for plastics was used for pilot plant production of synthetic rubber. A large amount of polystyrene did, however, find its way into moulded combs for the armed forces, into signal lenses and into instrument dials.

One of the large plastic production groups is that of the vinyl resins which as polyvinyl chloride or as the chloride acetate copolymer found increased use as rubber substitutes. Approximately 12,000,000 lb. of these resins were thus used in the first six months of 1942 with a resultant saving of 18,000,000 lb. of rubber. These applications were special protective paints, paper coatings, certain chemical tank linings, printing plates and stirrup pump hose. Germany made great strides in the use of polyvinyl chloride for valves, tubes and conduits.

Polyvinyl acetate was not only used as an intermediate in the manufacture of polyvinyl alcohol, polyvinyl acetals and vinyl chloride copolymers, but in its own right became a commercially important resin used primarily as an adhesive in water emulsion. Another vital use of this material was in the manufacture of sulpha drugs in which approximately 7% of the current production was used.

Polyvinyl alcohol made from polyvinyl acetate was used for solvent resistant tubing, foot pedal coverings, pulley facings, aircraft and refrigerant hose. Polyvinyl acetal, a condensation product of polyvinyl alcohol and aldehyde, was used for the waterproofing of raincoats and hospital sheetings, fuel tank liners, and shatterproof glass for tanks and armoured cars.

Because of the necessity for secrecy, a great many uses of plastic in the war effort could not be mentioned but these uses were expected to result in amazing revelations after the war has ended. As in World War I, the intense pressure of necessity in World War II, compressed into months developments which might have taken years to achieve under less urgent conditions. (*See* also CHEMISTRY; PAINTS AND VARNISHES; RAYON AND OTHER SYNTHETIC FIBRES; RUBBER AND RUBBER MANUFACTURE.) (H. W. PA.)

Platinum.

There was little information on world platinum production after the beginning of World War II. The U.S. Geological Survey estimated the 1941 output in Alask at 25,400 oz. of crude, containing about 22,630 oz. of platinu against 31,300 oz. of crude, containing 27,230 oz. of platinu in 1940. Operations at Goodnews Bay were expanded, and th 1942 output was expected to be greater. No Canadian figur were made public, but it was officially reported that the nick output had increased each year, and presumably the recove of the associated platinum metals increased proportionatel The Colombian total was not announced, but the chief produc reported 30,548 oz. of crude, containing 26,204 oz. of platinu in 1941, a marked increase over 1940. The 1941 total for Sout Africa was not received, but figures for 10 months indicated figure of the order of 90,000–95,000 oz. of platinum group metal containing 55,000–58,000 oz. platinum.

An order of the War Production board dated May 30, 194 placed platinum under priorities control, and required reports c sales, stocks and inventories. The reason was not so much a shor age of supply, as a desire to restrict as much as possible th chances of acquisition of platinum by the enemy, by smuggling out of the country, as well as by improper domestic use. (G. A. Ro.)

Plums and Prunes.

Fresh basis production of plums i 1942 was 72,000 tons in Californ and 5,300 tons in Michigan, compared with 71,000 tons in Ca fornia and 6,900 tons in Michigan in 1941; the ten-year (193 39) average was 64,600 tons in California and 5,370 in Michiga

Table I.—*U.S. Production of Prunes in Tons, by States, 1942 and 1941*

State	1942 (fresh basis)	1941 (fresh basis)
Western Oregon	61,000	54,000
Eastern Oregon	15,300	15,400
Eastern Washington	17,200	14,800
Western Washington	7,400	7,500
Idaho	17,800	21,000

No reports were available in 1942 from crops in central Europ a major prune-producing area. The department of agricu ture reported the United States prune crop, fresh basis, as 118,7 tons in 1942 and 112,700 tons in 1941, with a ten-year average c 159,320 tons, all in three states, Oregon, Washington and Idah

Table II.—*Quantities of Prunes Used Fresh, Canned and Dried*, in Tons*

State	1942	1941
Used fresh (fresh basis)		
Oregon	19,000	13,800
Idaho	17,800	21,000
Washington	13,900	10,600
Canned (fresh basis)		
Oregon	21,700	29,600
Washington	8,100	9,300
Dried (dry basis†)		
California	174,000	178,000
Oregon	7,000	6,500
Washington	200	400

*Includes quantities sold and used on the farm for household consumption.

†The drying rate in Oregon and Washington ranges from 3 to 4 lb. of fresh fruit to 1 l of dried; in California, 2½ lb. fresh fruit to 1 lb. dried.

California production, dry basis, was 174,000 tons in 1942. was 178,000 tons in 1941; the ten-year average was 207,100 ton (S. O. R.)

Pneumonia.

During 1942 there was a marked decrease the occurrence and fatality of pneumococ pneumonias, due, possibly, to the use of chemotherapy which, l prompt destruction of the pneumococci, diminished the numb of carriers. This was associated, however, with the increase the number of patients with pneumonia from whom it was im possible to obtain pneumococci and which were not responsi to sulphonamide therapy. These were grouped as "atypical" "virus" types. Some of these cases were undoubtedly due tacosis and other bird- or animal-borne viruses. Some pigeons New York city were infected with a psittacosis-like virus. l F. Meyer designated as ornithosis, psittacosis-like viruses ch infect domestic fowl and other birds.

clearer concept of the action of serum and chemotherapeutic ts developed. Chemotherapy acts on pyococcic organisms by rfering with their growth and the production of capsular sub- ce. Serum acts by neutralizing the capsular substance and itizing organisms so that they may be phagocyted, an entirely rent mechanism of healing. Sulphonamides may be ineffective use the organisms are fast to the drug or because substances h neutralize sulphonamide action develop in the body. Among e inhibiting substances is para-amino-benzoic acid and some o acids. By suitable observation of blood and sputum, the onse of the patient to his infection and the state of the in- ng coccus may be known. Frisch observed disappearance of nisms or chaining and phagocytosis when autogenous immu- develops. Reticulation of strands of capsular substance may resent and offer a grave prognosis. Serum has not been sup- ted by sulphonamides. Each remedy is used appropriately on occasion, one supplements the other. The combination bstitution may lower mortality.

lphadiazine was still the drug of choice for most pneumo- ic pneumonias. The virus pneumonias are a heterogenous p which, for the most part, are not influenced by chemo- apy but the diagnosis is often improperly made after in- uate study. (*See* also CHEMOTHERAPY; EPIDEMICS AND LIC HEALTH CONTROL; MEDICINE.)

and. A republic in northeastern Europe, invaded and conquered by the Germans in 1939. Area (Sept. 1,) *c.* 150,820 sq.mi.; pop. (official est. Jan. 1, 1939, including hen) 35,090,000. Capital: Cracow (280,000). Other chief : Warsaw (1,300,000); Lodz (690,000), Lwow (350,000); an (290,000); Vilna (225,000). Prime minister (1942): Wladislaw Sikorski.

Sept. 29, 1939, after the conquest of the country was virtu- completed, Germany and the U.S.S.R. partitioned Poland set up a new boundary which, running from north to south, ly followed the Pissa, Bug and San rivers. The Germans divided their territory into two sections: one, including the nces of Pomorze, Posen, Upper Silesia and Lodz, was di- annexed to the reich; the rest was constituted as the ernement General of Poland, under German administration, Cracow as the capital. After the Russian-occupied terri- s had been taken by German forces, eastern Galicia was in- d in the Gouvernement General on Aug. 1, 1941. Wolyn ynia) was left as a separate district. The northeastern parts oland, with Estonia, Lithuania and Latvia, and parts of J.S.S.R., were incorporated in a new German creation known stland.

story.—The signing of the Anglo-soviet alliance (*see* .R.) founded on the principles of the Atlantic charter, was of major importance to Poland in 1942, following as it did the soviet-Polish declaration of Dec. 4, 1941, and Stalin's statement that the soviet government wished to see a free, independent and powerful Poland. In the execution of their joint declaration of Nov. 11, 1940, the governments of Poland and Czechoslovakia signed in London on Jan. 23, 1942, an agreement settling the terms of their confederation, and expressed the hope that this would embrace other states of the European area with which the vital interests of Poland and Czechoslovakia were linked. On Jan. 21, Dr. Marjan Seyda (National party), one of the three members who had resigned in July 1941 after the signing of the Polish-soviet agreement, returned to the cabinet and became minister for postwar reconstruction. Waclaw Komarnicki (National party), minister of justice, and Jan Kwapiński (Socialist), minister of commerce, industry and shipping, were appointed to the other two posts vacated, and thus the government again became one of national unity. A new Polish national council was appointed on Feb. 9, composed of 31 members representing the four main political parties—Socialist, Peasant, National Labour and National. Professor Stanislaw Grabski was the speaker of the council.

The Struggle Outside Poland.—More than 100,000 Poles were fighting in 1942 with the allies in Britain and in the middle east, and Poland's army stood as fifth strongest among the United Nations. She had one armoured and motorized army corps in Scotland and one autonomous army in the middle east. The Polish air force was in 1942 twice as strong as it was in 1939. From Nov. 1, 1941 to Oct. 31, 1942, Polish fighter squadrons destroyed 86 enemy aircraft, raising the total since their arrival in Britain to 496. Polish bomber squadrons executed during the same period 2,960 operational flights against the enemy, bringing their total since June 1940 up to 3,992; and the Polish navy, too, was stronger.

Under German Occupation.—After the establishment in March 1942, under Alfred Rosenberg, of a ministry for the occupied eastern territories, Poland was divided into three great zones: the northwestern districts incorporated in the reich; the central parts and eastern Galicia included in the so-called Gouvernement General; the eastern area divided between two reich commissariats—Ostland (*q.v.*) and Ukraine. Speaking in Cracow on Oct. 26, on the third anniversary of his office, Hans Frank, the governor general, announced that the new epoch of the east in German history had begun, and further claimed that a considerable part of the Polish population understood the demands of the epoch and had accepted German leadership. The facts, however, belied his boasts. Stanislaw Mikolajczyk, the Polish deputy

POLISH CIVILIANS, released from Russian prison camps, en route to Tehran, Iran, in 1942 to volunteer for service with the United Nations prime minister, stated in London on July 9 that the number of Poles executed, murdered and tortured to death during nearly three years of German occupation amounted to 200,000; while the number of massacred Jews exceeded 200,000. Moreover, the Germans had tried many times to form a puppet Polish government but without success. Their disappointment was obvious when the reich press chief, Otto Dietrich, in Berlin in Feb. 1942, blamed the Poles for unleashing World War II, for their uncompromising resistance to victorious Germany and for their united efforts in obstructing and sabotaging Germany's economic efforts. By such suicidal behaviour, he affirmed, Poland had erased herself from the map of Europe. (K. Sm.)

Banking and Finance.—(In thousands of zlotys): revenue (est. 1939–40) 2,428,700; expenditure (est. 1939–40) 2,486,500; public debt, March 31 ,1939, 5,317,800; gold reserve (Aug. 31, 1939) 443,000. Bank notes in circulation (Aug. 31, 1939) 1,928,000. Exchange rate (1938 av.) 1 zloty=18.86 U.S. cents; (Aug. 1939) 1 zloty=18.75 U.S. cents.

Trade and Communication.—Foreign trade (in thousands of zlotys): imports, merchandise (1938) 1,299,600; (Jan.–July 1939) 762,300. Exports, merchandise (1938) 1,184,400; (Jan.–July 1939) 781,500. Communications: Roads (1937) 36,689 mi.; railways, main lines (1937) 11,223 mi.; shipping (July 1, 1939) 63 vessels, totalling 121,630 tons gross; shipping (Gdynia) net tonnage entered (monthly av. 1938) 542,000; (June 1939) 622,000; net tonnage cleared (monthly av. 1938) 542,000; (June 1939) 600,000.

Agriculture, Mineral Production, Manufacturing.—(In metric tons) (1939): wheat 2,270,000; barley 1,480,000; rye 7,630,000; oats 2,880,000; (1938) maize 126,200; potatoes 34,558,200; beet sugar 387,000; coal 38,104,000; petroleum 507,000; pig-iron and ferro-alloys 968,000; steel 1,542,000. Industrial production (monthly av. 1938) (1929=100) 118; (June 1939) 127. Unemployed (monthly av. 1938) 347,509; (June 30, 1939) 241,464.

Police.

The year 1942 intensified the effects of World War II upon police forces everywhere. In the vicinity of the fighting fronts civil police either disappeared altogether or were virtually absorbed into the support of armies actively engaged in conflict. In occupied territories established police forces continued their duties of civil protection and law enforcement, but operated under the vigilant surveillance and control of the occupying troops. On the "home fronts" of more than a score of other belligerent nations, police continued to enjoy their usual civil status, but found themselves collaborating more and more with the military arms in the enforcement of wartime regulations, in joint manoeuvres of a defensive character, and in measures aimed at espionage and sabotage. In all countries, including a few remaining neutrals, civil police were confronted with new problems originating in war at home or abroad.

Police activity in general was also enlarged by the appearance of increasingly greater components of military police. These performed patrol duties in many areas that had formerly been the exclusive province of civil police. Manpower shortages in some instances required, as in Great Britain, that women be organized as uniformed police units for the performance of many tasks, particularly the regulation of traffic and the maintenance of routine observation patrols. Shortages in durable goods raised difficult problems in maintaining an uninterrupted supply of police equipment, and particularly in the United States, where many of the larger police developments revolved around the adaptation of mechanical devices to the special requirements of police.

Auxiliary police, consisting chiefly of part-time aides to regular police establishments, were widely organized. In United States, such special recourses were so extensively adop that they threatened to overburden the regular police by the sh weight of their numbers and inexperience. A summary of ratios and distribution of some 75,000 auxiliary police enrolled the service of 408 American cities on April 30, 1942, appears Table I. It shows such wide and inexplicable variations in ratio of enrolled auxiliaries as to raise serious question whet public policies in this area of police development rested upon a coherent plan or purpose.

As was to have been expected with the advent of wartime c ditions, the number of regular police increased somewhat in 19 despite increasing difficulties in recruiting young, able-bodied a intelligent males to the police service, when the same men w the particular objects of military recruiting programs. The ra of police to population, in 1942 as compared with 1941, appe in Table II.

Table I.—*Quotas of U.S. Auxiliary Police by Geographic Divisions and Population Groups, 1942*

Number of Auxiliary Police per 1,000 Inhabitants by Geographic Divisions	Population Groups of Cities (000 omitted)				Total
	I Over 250	II 100 to 250	III 50 to 100	IV 25 to 50	
New England	4.24	3.69	4.70	4.96	4.37
Middle Atlantic	1.45	4.22	3.58	4.87	2.19
East North Central	1.36	3.83	3.50	2.67	2.11
West North Central	2.64	3.45	1.81	1.87	2.59
South Atlantic	3.86	4.44	4.94	5.19	4.44
East South Central	5.87	2.30	15.22	3.11	6.02
West South Central	2.49	3.58	2.83	2.48	2.75
Mountain	1.67	10.00	2.08	1.77	3.25

General Averages	2.47	4.37	4.24	3.89	3.1

Table II.—*Numerical Strength of U.S. Municipal Police Forces, 1941-42*
(Number per 1,000 inhabitants)

Population Groups of Cities	1941	194
Group I—Over 250,000	2.12	2.13
Group II—100,000 to 250,000	1.45	1.50
Group III—50,000 to 100,000	1.37	1.46
Group IV—25,000 to 50,000	1.23	1.29

The index of police effectiveness, as represented by the prop tion of reported crimes that were "cleared by arrest," continu in general to decline, as it had each year since the peak est lished in 1938. Table III shows the comparison of 1941 w 1940, the two latest years for which index figures are available.

The number of policemen killed by criminals constitutes index of law observance attitudes. In 1941 there was an incre in such cases in American cities, although not sufficiently large overtop the levels reached in recent years, and far below records compiled during the prohibition era. Table IV prese

Table III.—*Per Cent of Crimes Cleared by Arrest in U.S. Cities, 1940-41*

Uniform Classification of Crimes	1940	1941
Murder and non-negligent manslaughter	88.7	88.1
Negligent manslaughter	83.4	86.6
Rape	79.4	76.2

nparisons for 1937–41.

The annual congress of the International Association of Chiefs Police was held in New York city in Sept. 1942. Questions sidered were largely confined to problems arising out of war-e conditions. Special attention was directed at the establish-nt of professional standards for dealing with the suppression prostitution and venereal disease as a military efficiency meas-. During the year, the association continued its efforts di-ted at extending the system of police mobilization already ablished in a number of states. (*See* also CRIME; KIDNAPPING; RET SERVICE.)

litis, Nicolas Socrate (1872–1942), Greek jurist and diplomat, was educated at the versity of Paris, and at the age of 27 became professor of rnational law at Aix-en-Province university. He held similar s at the universities of Poitiers and Paris. He was permanent etary-general in the ministry of foreign affairs of Greece, 4–16, and minister of foreign affairs, 1916–20. Thereafter, permanent delegate to the League of Nations, he became one he leading spirits at Geneva, and was president of the as-bly in 1932. During his long service with the League, he oured for peace and repeatedly warned that the League's ar-ation program would fail unless it was backed up by force. was one of the chief designers of the Geneva protocol, and also headed the committee that set up the World Conference Limitation of Armaments in 1929. He served again as foreign ister of Greece for brief periods in 1922 and 1936 and was ister to France, 1924–36 and 1938–40. He died in Cannes, nce, March 4.

o. Soon after the entry of the United States into World War II, the United States Polo association suspended national championships and other formal matches played er its auspices and, with most of the polo players and all of officers of the association in active service, what polo there during the year 1942 was of a purely informal nature. The championships decided during the year were intercollegiate, Yale winning the indoor tournament held at West Point and ceton taking the outdoor title played at college fields, defeat-Yale in the final round.

olo in the eastern United States was confined to two or three s. There was considerable play in Texas and the middle west the cavalry training centre at Fort Riley in Kansas was a re for several months because a good many high ranking s passed through during the course of their military training.

y executive committee action, F. S. von Stade was appointed erve as acting chairman of the association in place of Lt. E. T. y, on duty with the army air force, and W. T. Kissel to e as acting secretary-treasurer in place of Lt. Commander I. Carnochan, on active duty with the navy. (R. F. K.)

rten, Hein ter (1887?–), Dutch army officer, was trained at Holland's Royal Military emy. One of the first Netherlands officers to obtain a pilot's ce, Poorten long advocated increasing the air arm of Dutch es, and made several visits to the United States to study air-. and purchase planes. A veteran of 30 years service in Holland's Asiatic colonies, he was made commander in chief of the Netherlands East Indies army and head of the war department in Oct. 1941. After Japanese invasion forces landed on the island of Borneo in late Dec. 1941, he called upon the Allies for more bombers, fighting planes and anti-aircraft guns. On March 2, 1942, he was given command of United Nations armies in Java, but eight days later the Japanese had conquered Java and Poorten was captured and interned in an enemy army camp.

Porras, Belisario (1856–1942), president of Panama was born Nov. 28 in Las Tablas, Panama, and attended the universities of Colombia and Brussels. Dr. Porras served in the Colombian government as consul in Brussels in 1881. He was professor of law at the University of San Salvador. A dynamic personality, Dr. Porras led a successful revolt on Chiriquí and proclaimed himself leader of the Isthmus in 1900. Although he objected to the new Republic of Panama in 1903, he was finally persuaded to lend his talents to the Panamanian administration, and he served as president 1912–16, 1918–19 and 1920–24. Later, he also served as Panama's minister to France, Great Britain and Italy, and he represented his country at the League of Nations. He died in Panama City, Aug. 28.

Porto Rico: *see* PUERTO RICO.

Portugal. A republic of western Europe, forming part of the Iberian peninsula and bounded on the N. and E. by Spain and on the S. and W. by the Atlantic ocean. Area (including Azores and Madeira), 35,670 sq.mi.; pop. (census Dec. 12, 1940) 7,702,000. Chief towns: Lisbon (cap. 594,300), Oporto (232,280). President (1942): Gen. Antonio Carmona; premier, Dr. Oliveira Salazar (*q.v.*); language: Portuguese; religion: Christian (mainly Roman Catholic).

History.—The year 1942 opened with discussions between Portugal and Britain, following the occupation of Portuguese Timor (Dec. 17, 1941) by Allied troops in view of the imminent invasion by Japan. As a result, the Portuguese government announced (Jan. 23) that troops would be sent to Timor from Lourenço Marques immediately. Before they could arrive, however, Timor was invaded by the Japanese and the troops were recalled. In a strong protest to Tokyo, Dr Salazar observed that Japan must have known that Portuguese troops were on the way and had thus no excuse for her action; he also paid tribute to the loyalty and goodwill of the British government during the discussions.

Friendly relations between Portugal and Spain continued. On Feb. 12–13 their heads of government and foreign ministers met for discussions at Seville. A Portuguese-Spanish scientific congress was held at Oporto (June 18–24). On Feb. 8 General Carmona, 72 years of age, was re-elected, without opposition, to the presidency.

Upon the opening of the North African campaign Nov. 8, President Roosevelt sent President Carmona a formal assurance that the military operations were in no way directed against Portugal or its possessions. In his reply dated Nov 12, Carmona expressed his gratitude for the message, "another proof of the unalterable and confident friendship existing between our two nations."

In June, as a further precaution against inflation, the government, which had again issued a balanced budget, launched a new 3% loan of 1,000,000,000 escudos. Since 1939 the cost of living had risen by 44% without a corresponding rise in wages and salaries. As a first step toward the alleviation of hardships, Dr. Salazar promised workers' deputations a system of family allowances. On June 25 he broadcast to the nation on "Defense: economic, moral and political." In September it was announced that all school clubs, societies, etc., must be incorporated into the national youth movement of Portugal. A series of strikes, accompanied by some unrest, broke out in Lisbon in late October, but these were quickly settled.

War conditions during 1942 greatly affected Portuguese life. Fuel shortage reduced lighting and decimated train services. Lack of gasoline and rubber almost stopped private motoring. Dearth of sulphates threatened the port wine industry. The price of wolfram, one of Portugal's metals, was fixed. Black marketing in food was being dealt with. War profits were taxed. In August stocks of olive oil were requisitioned. A scheme of civil defense was prepared against possible emergency; test exercises were held in Lisbon.

Plans were approved for the erection at Coimbra of a "university city" covering 200,000 sq.m. The budget for 1942 included a large item for the restoration and upkeep of historical monuments. (E. A. P.)

Education.—Elementary (1938–39) schools 7,962; scholars 462,854; secondary schools 42; scholars 18,242; universities 3; students 5,182.

Banking and Finance.—Revenue, ordinary (est. 1942) 2,132,900,000 escudos; expenditure, ordinary (est. 1942) 2,126,600,000 escudos; public debt (Dec. 31, 1940) 6,489,700,000 escudos; notes in circulation (June 30, 1942) 4,511,000,000 escudos; gold reserve (June 30, 1942) 1,372,000,000 escudos; exchange rate (average 1941) 1 escudo = 4.002 cents U.S.

Trade and Communications.—External trade 1941 (merchandise): imports 2,642,700,000 escudos; exports 2,896,200,000 escudos. Communications and transport (Dec. 31, 1937): roads, first and second class 8.858 mi.; railways, open to traffic, 2,187 mi.; motor vehicles licensed (Dec. 31, 1937): cars 34,442; commercial 11,410; cycles 4,536; shipping (June 30, 1939) 269,000 gross tons.

Agriculture and Minerals.—Production 1940 (in metric tons); wheat 285,100; maize 367,900; wine 5,187,000 hectolitre coal 310,000; rye 76,100; oats 25,000; rice (1939) 71,600; barl 26,200; potatoes 616,700; olive oil 34,500; sea fisheries (exclu ing cod-fishing) 195,000. (*See* also PORTUGUESE COLONIAL E PIRE.)

Portuguese Colonial Empire.

Total area (approx 839,506 sq.mi.; tot population (est. Dec. 31, 1939) 9,930,000, excluding Portug the Azores and Madeira. Certain essential statistics of the coloni possessions of Portugal (*q.v.*) are given in the accompanying tab

History.—In June, Dr. Vieira Machado, minister for the col nies, visited Angola, Mozambique, Belgian Congo and the Uni of South Africa. In Mozambique he took formal possession of t territories of Manica and Sofala, previously held by the Charter Company of Mozambique, which, on July 18, reverted to sta administration. This transference marked the end of the la Portuguese chartered company and completed the unification the Portuguese empire.

Despite the war, colonial development continued. Angola w proceeding with the construction of the port of Loanda an Mozambique with the construction of the Tete railway and t irrigation of the Limpopo river. The Portuguese governme established the first centres of overseas colonization, in whi selected families were to be settled, financed and provided wi machines and tools necessary to them.

Strong reinforcements were sent, not only to Timor, but other colonial stations of strategic importance—notably to t Azores, Cape Verde Islands and Angola. (E. A. P.)

omens sem caminho and Bernardo Teixeira's partly epistolary *tónio*. João de Castro Osório, author of a *Cancioneiro sentintal,* published the first drama in what was to be a Maeterckian tetralogy (*Tetralogia do Príncipe imaginário*) under the le *O Ramo de flores sem flores.* Of verses, in which Portugal always prolific, outstanding collections were the modernist rnando Namora's *Mar de sargaços,* Fernanda de Castro's *39 emas* (containing both old and new) and *33 Poesias* by a less own poet of great promise, Cabral do Nascimento.

Collections of essays appeared in great number and variety. table were António Ferro's sidelights on contemporary history itled *Homens e multidões;* the *Ensaios* in which B. Xavier utinho leads us down bypaths of history and comparative litture; Professor Mendes Correia's historical essays and articles; *Raça e do espirito;* and an *ideário,* more personal in character, *imas Aventuras,* by the well-known historian of Portuguese rature, Dr. Fidelino de Figueiredo, who was in 1942 in Brazil. eiroz Veloso's critical biography, *Fernão de Magalhães,* apred appropriately in the wake of the 1940 celebrations. uardo Brazão's *Relance da história diplomática de Portugal* ers the period from 1640 to 1942 with special attention to the h century.

)f the classics, Gil Vicente came in for preferential attention, a popular biography by Queiroz Veloso, a critical study by o de Almeida (*Notas para uma edicão de G. V.*) and two edis from Coimbra: Dr. Paulo Quintela's, of *Auto da emcaçáo da glória,* and Dr. A. J. da Costa Pimpão's of the *gicomédia pastoril da Serra da Estrêla.* Apropos of the ero de Quental centenary were Manuel Mendes' *A. de Q.* (a ular life), A. C. Monteiro's edition, *Cartas* (of A. de Q.) *a ónio de Azevedo Castelo Branco* and F. Ramos' *A Expressão liberdade em Antero e os Vencidos da vida.* Other editions e two of Vieira's sermons by Mário Goncalves Viana, who wrote a slight but significant study *Os religiosos e os místicos literatura portuguesa;* A. C. Pires de Lima's *Poesias selectas Frei Agostinho da Cruz* and José Pereira Tavares' edition of ther of Portugal's *clássicos esquecidos,* Filinto Elísio. Three lies of more modern authors were: *O Talento e os desvarios Guerra Junqueiro,* by the veteran politician and voluminous er António Cabral; Norberto Lopes' life of Sr. Teixeira nes (*O Exilado de Bougie*) and Eduardo Coelho's *Ricardo ge* (*Recordações*).

he first volume of an important new *Bibliografia Geral tuguesa* appeared, dealing with the 15th century. (E. A. P.)

tuguese West Africa: *see* PORTUGUESE COLONIAL EM-.

st Office.

The audited revenues of the post office department for the fiscal year 1942, as stated in the rds of the comptroller general of the United States, amounted 859,817,490.88. This was the highest in postal history and 989,755.17 higher than in 1941, which was the next highest. here were also reported to the treasury department the items ed in the act of June 9, 1930, indicating the estimated post- that would have been collected if the services had been on a ılar pay basis, in the case of penalty and franked mail, free-inıty mail, differentials in second-class mail matter and free ter for the blind. These amounted to $73,916,128.

he expenses of the department for the fiscal year as audited unted to $873,956,527.57, of which amount $24,324,210.89 on account of prior years. There was $22,010,360.11 to be on account of the 1942 fiscal year. This left a total exe for the fiscal year 1942 of $871,642,676.79, resulting in a s operating deficiency on an accrual basis of $11,825,185.91.

Effective March 27, 1942, free mail privileges were granted to members of the armed forces. It was estimated that 154,885,703 pieces of first-class mail were mailed during the three months ending June 30, 1942 by U.S. soldiers and sailors. The revenue which would have been derived from this mail at the rate of 3 cents apiece would have amounted to $4,646,571.

The tremendous increase in the volume of mail handled by the post office department for other branches of the government had been a matter of concern to congress and the department for a number of years. Thousands of tons of forms, pamphlets, circulars and supplies were being sent by government departments and establishments free of postage under the "penalty privilege." Congress enacted laws prohibiting, with certain exceptions, the sending free of postage of books, reports and bulletins without a request therefor. Congress also required that reports be submitted each quarter from the various executive departments and independent establishments of the government to the post office department showing the weight, by classes, of matter mailed free. The records disclosed that during the fiscal year 1942 there were mailed free 1,516,015,444 pieces, weighing 236,529,015 lb., an increase of 392,451,723 pieces and 84,852,924 lb. over the previous year.

The intensive bond and stamp sales program, inaugurated May 1, 1941 in co-operation with the treasury department, was greatly expanded after U.S. entry into the war On June 30, 1942, war savings stamps were on sale at 33,878 post offices. Sales from May 1, 1941, to June 30, 1942, amounted to $314,708,228.55. Sales during the period from Dec. 1, 1941 to June 30, 1942 aggregated $283,197,574.45, or an average of $40,456,796.35 per month for the first seven months of the war.

From March 1, 1935, when the United States savings bonds were placed on sale at post offices, to June 30, 1942, there were sold through the postal service 35,128,618 bonds, having a sale value of $4,309,937,575. During the fiscal year ended June 30, 1942, 19,204,630 bonds, having a sale value of $956,754,675, were sold. At the close of the year bonds were on sale at 19,956 post offices, including 1,102 branches and stations, a net increase of 3,200 over the preceding year.

The post office department was charged with the distribution of War Manpower commission forms for voluntary registration of women over 18 years of age for war work. This work called upon carriers to leave one form at each household on their routes "unless they have reason to believe that two or more women over 18 years of age reside in the household, in which case a form for each woman should be delivered" The forms were not to be delivered to offices, stores, factories or any other place of business.

Through its 43,406 post offices and 4,802 stations being conducted under contract agreement, as well as 1,678 classified stations and branches, there were received, transported and delivered approximately 30,207,000,000 pieces of mail matter during the fiscal year, having a weight of 3,228,000 tons, representing an increase over the previous fiscal year of 971,000,000 pieces of mail and 103,000 tons.

On June 30, 1942, there were 4,802 stations being conducted under contract agreement. The average cost per contract unit was $352 and the total cost of operation during the fiscal year amounted to $1,689,000, whereas the receipts from the sale of stamps at these contract stations amounted to $38,822,000 during the calendar year 1941.

During the fiscal year, city delivery service was established in 49 additional cities, thereby increasing to 3,347 the number of cities in which this service was in operation. It was extended to 34,338 blocks of territory serving 636,050 families and 26,817 new places of business.

Postmasters.—During the fiscal year there were 1,974 postmasters confirmed by the senate and appointed without term by the president. There were 1,132 presidential postmasters reappointed upon the expiration of their commissions and 240 reappointed due to advancement of their offices from the fourth class to the presidential grade, which necessitated new appointments. Of the postmasters appointed, 1,259 were due to the expiration of four-year terms, 285 to advancement of offices from the fourth class to the presidential grade, 131 to resignations, 140 to deaths, 75 to removals, 25 to retirement, 56 to transfers to other classified positions, 2 to failure of postmaster to qualify after appointment, and 1 to the establishment of a new presidential post office. Fourth-class postmasters were commissioned at 2,177 offices during the year as vacancies occurred through various causes.

Dead Letters.—During the year 14,990,943 letters were impossible of delivery, an increase of more than 9% over the previous year. This increase reflected to some extent the increased volume of mail handled but was due more to the large number of incorrectly addressed letters for the military and naval forces and for civilians who moved incident to changes in location due to war work. A total of 2,637,490 letters were returned to the senders, of which 278,345 were found to contain valuable enclosures and 79,475 of them contained money, amounting to $133,077. A total of 12,271,677 letters were destroyed as undeliverable. Money found loose in the mails amounted to $31,440. There were also 237,100 unclaimed parcels and articles found loose in the mails. These parcels were sold at public auction and $61,000 realized.

Air Mail.—On June 30, 1942, there were 44,623 mi. of domestic air mail routes in operation, an increase of 1,212 mi. over 1941. The number of miles flown was 89,410,021, which was 14,154,813 more miles than in 1941.

A number of transport aircraft available for mail service on domestic routes was transferred to the military service near the close of the fiscal year 1942 but a program for the most extensive use of the remaining equipment was organized which permitted the maintenance of essential routes and schedules and the transportation of an increased volume of air mail with reasonable expedition.

While foreign air mail routes were necessarily curtailed, extensions on the other hand were made to certain areas and the frequency of service was materially increased to the Latin American countries and to Hawaii and Alaska.

Rural Delivery.—The rural delivery routes in operation on June 30, 1942 required a total daily travel of 1,420,971 mi. by rural carriers in providing service to approximately 29,200,000 patrons. The policy of consolidation of rural routes to absorb vacancies was continued. Operation of the rural delivery service resulted in an expenditure of $91,631,650 for the fiscal year as compared with $91,501,569 for the previous year, an increase of but $130,081 over 1941. The amounts saved through consolidation of routes were utilized to establish new routes and provide extension of existing routes. Thereby 9,218 more miles were covered by rural carriers at the close of the fiscal year 1942 than in 1941. Rural delivery service was transferred from the jurisdiction of the second assistant postmaster general to the first assistant postmaster general on July 1, 1942, to co-ordinate it better with other delivery services.

Postal Savings.—The postal savings system continued to merit a widespread public demand for its services; the depositors numbered 2,812,806 for 1942, a decrease of 2.43% from the preceding year. The balance due depositors represented by outstanding certificates of deposit was $1,315,410,402, an increase of $11,257,128, or about nine-tenths of 1%. In addition, there was held in trust for depositors $166,341,239.40, represented by outstanding postal savings stamps, now called war savings stamp accrued interest of $38,556,979.69, and unclaimed deposits $112,930, making a total of $1,520,421,551.09. At the end the year, postal savings certificates were on sale at 8,063 d positories, including 852 branches and stations; but savin stamps were on sale at all post offices and practically all branch and stations.

Buildings.—During the fiscal year 1942, 58 new governmen owned post office buildings were placed in operation, 7 extensio to existing buildings were completed, and 6 new federal buildin replaced a similar number of old buildings. Through reassig ments of space within these buildings, agencies of the gover ment which were or had intended occupying commercial quarte were accommodated, with a saving of $17,255.60. Due to t war, the public building program was suspended. Expiring leas numbering 1,023 were renewed in 1942. Where necessary meet increased service needs, larger quarters and superior faci ties were obtained, and in other cases necessary improvemen were secured in the occupied quarters. The square foot cost renewing leases was reduced from 77.2 cents in 1941 to 73.8 cen in 1942. One hundred and nineteen new leases were made, i cluding 105 for offices previously occupying space on a month rental basis, the new contracts providing improved quarters a in many instances complete new equipment. (I. Gg.)

Great Britain.—The 1942–43 budget estimate of expenditur £102,523,000, showed an increase of £8,800,000 but, addition war expenditure being met from vote of credit, comparisons a difficult. The revenue estimate, £112,523,000, was £14,000,0 above the estimate for 1941–42 (£3,000,000 above actual r ceipts). These figures exclude wireless licences, which were to accounted for separately but include war surcharges, estimated £14,500,000. Commercial accounts were suspended to save wor

Inland posts suffered less dislocation from bombing than 1941. Overseas mails, despite attacks on shipping, successful adjusted themselves to the ever increasing number of troo serving abroad. Airgraphs were extended at a charge of 8*d*. civilian correspondence to and from Canada, South and Ea Africa, the middle east, India and Ceylon and before the end 1942 the total traffic to and from troops and civilians reach 2,000,000 pieces weekly. A 6*d*. "air letter" to the troops supe seded the 3*d*. air postcard at the end of 1942.

Telephone and telegraph services carried increasing loads fro the fighting and defense services, vital war industries and vario other sources. All urgent traffic was handled expeditiously n withstanding widespread dilution of operative and engineeri staff and extensive work on replacement of circuits withdra for fighting operational purposes. Long distance circuits we more than doubled after the outbreak of war and various ne facilities introduced in the overseas telegraph services to me strategic needs and to give British and Allied troops means rapid communication home.

While war restricted some postal traffic, mainly by reduci circular advertising, the heavy increases mentioned combined wi new work at the public counters required further intake of sta In Oct. 1942, the number employed was 293,000. The pre-w total was 283,000 of whom 65,000 (including 1,200 women) h joined the forces and 4,900 were on loan to other government d partments. These movements were balanced by the employme of temporary staff, mostly women, raising the pre-war total 64,000 women to 121,000. (*See* also PHILATELY.) (S. R. C.)

Potash.

With the bulk of the world potash output within immediately adjacent to the war zone, there w little information on the industry after 1939. German expo overseas, of course, stopped and shipments within Germany a e occupied areas were seriously handicapped by the shortage of our, materials, and shipping facilities, and these conditions ere intensified by the absorption of the Alsatian mines after e fall of France. Nothing whatever was heard from the Rus- n industry, or of that of Poland. The Spanish industry, which s closed by the civil war, was reopened in 1940, but the output s reduced well below its former level by the lack of markets in ance and Great Britain.

In the United States the 1941 output increased 38% over 1940, 524,875 short tons of K_2O, while sales increased 35% to 531,- 6 tons of K_2O. Sales exceeded production, and stocks were luced slightly. Imports during the first nine months of 1941 had clined to the rather nominal figure of 45,581 long tons of salts, ile exports were 70,169 tons, leaving the domestic supply more n self-sufficient. (*See* also FERTILIZERS.) (G. A. Ro.)

tatoes.

The highest per-acre yield on record was made by the United States potato crop of 1942, when pro- ction averaged 135.7 bu. per ac. This is 5 bu. more than the rage acre yield of 1941 and 9 bu. above the five-year (1937– average. The 1942 crop was estimated Nov. 1 by the depart- nt of agriculture as 379,624,000 bu. compared with 357,783,000 in 1941 and a 10-year (1930–39) average of 370,045,000 bu. e department of agriculture announced a program in March 2 to support prices, to induce growers to increase the 1942 eage planted to potatoes by 10%. The area seeded to potatoes 1942 was 2,844,700 ac., about 1.8% over the 1941 acreage of 93,000 ac. Increased production was urged because it was esti- ted that United States starch requirements in 1942 might ex- d 4,000,000,000 lb. The largest production of potato starch the United States was 54,500,000 lb. from 8,000,000 bu. in crop year of 1940–41. Prices for potatoes were subject to a ximum by government regulatory order of Nov. 9, 1942. ato consumption improved, under wartime demand in 1942, rking a change from the steady trend of declining per capita sumption for more than 20 years owing to competition from er vegetables, particularly frozen foods, and because of the lely current belief that potatoes are fattening. Although a wing use of dehydrated foods to save space in shipments over- s was reported in 1942, such development did not affect atoes or other vegetables because there were not enough de- rating plants in the United States in which to process potatoes any material quantity.

weet Potatoes.—The 1942 sweet potato crop in the United States was 69,814,000 bu., as indicated Nov. 1 by the department of agriculture. The 1941 crop was 63,284,000 bu.; the 10 year (1930–39) average, 73,208,000 bu. Average per-acre yield was 92.2 bu. in 1942. It was 84 bu. in 1941; the ten-year average, 83 bu.

(S. O. R.)

Poulsen, Valdemar

(1869–1942), Danish engineer, was born Nov. 23 at Copenhagen. He invented the telegraphone in 1898 and devised the Poulsen arcs used in radio. With Prof. Reginald Aubrey Fessenden, U.S. physicist and engineer, Dr. Poulsen was credited with the invention of a wireless telephone system. His death was reported in New York city, Aug. 6, by the National American Denmark association. (See *Encyclopædia Britannica.*)

Poultry.

The 1943 goal for production of dressed poultry in the United States was placed by the Office for Agricultural War Relations as 4,000,000,000 lb. of chickens and 560,000,000 lb. of turkeys. The 1942 goal for chickens, 3,118,000,000 lb., was attained. The 1942 production for turkeys was 485,000,000 lb., which was 15,000,000 lb. short of the prescribed goal. At the beginning of 1942 the number of chickens on farms was estimated by the department of agriculture as 473,933,000 compared with 422,909,000 a year earlier; turkeys, 7,710,000 at the beginning of 1942 and 7,252,000 a year earlier. Production during 1942 was the heaviest on record, and operations of commercial hatcheries, beginning with Nov. 1942, were on a scale which indicated a still larger production in 1943. The output of commercial hatcheries in Nov. 1942 was at the record top for that month—25,000,000 chicks, 2,300,000 more than the Nov. 1941 hatch. The hatch would have been still higher except that it was impossible to obtain more eggs. Ceiling prices were placed on turkeys Nov. 9, 1942, and on chickens Dec. 18, 1942. Prices were at ceiling levels at the end of 1942. Exempt from the price control were stock for breeding purposes, baby chicks, ducklings, goslings and poults. The high production of chickens asked in 1943 was considered dependent on an increase of 10% in chickens raised on farms for flock replacements and an additional 125,000,000 young chicks raised in general farming areas. The hatching season was unfavourable for turkeys in 1942, and increase in 1943 depended on farmers retaining turkey hens for egg production. If commercial broiler producers were to shift their output to marketing heavier birds, the 1943 production would thereby be increased from 150,000,000 to 200,000,000 lb. Commercial broiler producers in 1942 marketed approximately 200,000,000 birds. To reach their proportionate part of the 1943 goal they would have to market 275,000,000 birds of average weight of not less than 3 lb. (*See* also EGGS.) (S. O. R.)

Presbyterian Church.

The Reformed churches holding the Presbyterian system, within the United States of America, were 12 in number and included in 1942, 18,561 ministers, 18,534 churches, and 3,891,292 communicant members with approximately 7,500,000 adherents. Outside of continental United States they had 2,148 American foreign missionaries and 13,951 native workers in a total of 21 countries with a communicant membership of 240,528.

All of the churches of the Presbyterian family affirming "that we are a people with a national heritage that makes for free men and that this heritage is opposed by those who contend against us in the present war," united in pledging themselves to pray and work for a right victory and an enduring peace. Facing their present war-emergent tasks they enlarged and further implemented their wartime activities. Over 700 of their ordained ministers volunteered and were commissioned as chaplains with the armed forces. Almost $2,000,000 in special funds were raised and used for spiritual work among soldiers and sailors, for the special religious needs in national defense industry areas, and for foreign relief causes. The General assembly of the Presbyterian Church in the United States of America appointed a committee to study the vital matter of a righteous peace based on "the principles of the Christian religion."

In the oecumenical field, provisions were made for celebrating the 300th anniversary of the historic Westminster assembly which convened in Westminster abbey, July 1643, and formulated the doctrinal standards used by Presbyterian churches throughout the world. Continued progress was made in negotiations looking toward closer relations and eventual union between the Presbyterian Church in the United States of America and the Protestant Episcopal Church, and between the former church and the Presbyterian Church in the United States (Southern).

The western section of the World Presbyterian alliance, representing the Presbyterian and Reformed churches in the United States and Canada with representatives from Europe and Asia, held its annual meeting in Atlantic City, N.J., Feb. 10–11, 1942.

Europe.—A new sense of vitality and hope distinguished all the reports from the Reformed churches in Europe. The Reformed Church in France continued to keep alive the sense of its absolute solidarity looking to the time when the true independence of the country would be restored. The decision wa made that the churches of the occupied zone, instead of meetin in a General assembly, would meet in an interregional synod en dowed with all administrative powers within the framework of th decisions of the national synod. In spite of the arrest of man of its outstanding leaders and the general restrictions upon it freedom, the congregations of the Reformed churches of Hollan and Belgium continued their work.

The general convention of the Hungarian Reformed Churc was held in Budapest in May. The Vienna arbitration divide the Transylvania Reformed Church in two—two-thirds of th parishes went to Hungary, the rest, comprising 251 parishe with about 238,000 persons, remained in Rumania. The scant news from Bohemia and Moravia indicated that the Czechoslova Church was still hard at work. The Reformed churches in Eastern Europe, particularly in Poland, Lithuania and the Ukrain as organized bodies practically disappeared. Very few report emanated from the church in Germany, but there was ample ev dence in them of "the vast passive support" given to the opp sition churches. (W. B. PU.)

THE RIGHT REV. JAMES H. COCKBURN, moderator of the Church of Scotlan visited the U.S. in Feb.-April 1942, preached at several churches, including th Washington cathedral, and was received by Pres. Roosevelt

esidents, Sovereigns and Rulers.

The following list includes the names of those holding chief sitions in their countries at the beginning of 1943.

Price Administration, Office of.

During 1942, OPA placed controls over the prices of almost everything the people of the United States eat, wear and use—from the first shipment of raw material to the final finished product and its sale at retail. Rent regulations controlled the prices for living quarters in areas in every state in the nation except North Dakota. Rationing regulations distributed the national supplies of sugar, coffee, gasoline, typewriters, bicycles, automobiles, fuel oil and tires.

The first 10 days after the Dec. 7, 1941, attack on Pearl Harbor were days of frantic effort to check prices of many commodities affected directly or indirectly by the prospect that imports from the far east would be seriously curtailed or entirely cut off.

Preventive action of one kind or another was taken to hold down the prices of refined sugar, wheat, butter, soybeans, eggs, flaxseed, millfeeds, soybean and cottonseed meal, wool, coffee, cocoa, pepper, flashlights (there was a buying panic and profiteering along the west coast), leather, and some 1,800 fats and oils. It was this latter move—a temporary 60-day ceiling over fats and oils—that turned the tide. By noon on Monday, Dec. 15, 1941, basic commodity prices had receded to levels somewhat under the closing prices of Monday, Dec. 8.

The declaration of economic war came on Jan. 6, 1942, when President Roosevelt outlined his "Blueprint for Victory" that called for production of armaments on a record-breaking scale. Expenditures of from $5,000,000,000 to $6,000,000,000 a month for war as indicated by the president's message meant that civilian purchasing power, if uncontrolled, would be swollen far beyond already history-making levels and would collide head-on with a drastically curtailed production of civilian goods. All previous concepts of the size of the pending job were scrapped. Planning of new measures of the broadest kind began.

The Emergency Price Control act of 1942, giving OPA statutory authority, became law on Jan. 30, 1942.

Tire rationing early in Jan. 1942 fell to OPA's already overloaded staff. Other rationing programs followed swiftly—automobiles and sugar—and before the winter was over OPA had emerged from relative obscurity and had become a familiar symbol in every home in America. With the establishment of ration boards in every county of each of the 48 states, nearly 30,000 volunteers were added to the staff.

March saw the first attack on high rents in defense areas, the initial major action under the Emergency Price Control act signed by the president Jan. 30. Price actions came fast thereafter and reached a climax April 28, when the General Maximum Price Regulation was issued, an omnibus order that took in everything congress had not excluded from control or was not already covered in earlier regulations.

The "General Max" was timed to follow immediately the president's anti-inflation message, containing a 7-point program that called for legislation involving heavy taxation and restoration of the parity principle instead of the 110% of parity formula contained in the Price Control law. Success of the "General Max" was immediate and dramatic. It brought to a dead stop 19 months of continuous advance in the cost of living.

This success, however, was not to continue for long. There were two major reasons. First, and most important, was the fact

PRICE FREEZING of most U.S. commodities at the levels of March 1942 was announced by Price Administrator Leon Henderson at a press conference in Washington April 28, 1942

that extra parity provisions for farm products in the Price Control law left uncontrolled nearly 40% of the items in the average family's food budget. Second, implementation of the other anti-inflation measures recommended by the president was slow; in fact, as to two major points—heavy taxation and wage stabilization—it was completely lacking.

During the summer, the price control situation deteriorated. Propelled by abnormally large increases in prices of the food stuffs exempt by law from OPA control, the cost of living resumed its upward march. As new crops of uncontrolled fresh fruits and vegetables reached the market for processing and canning at prices greatly ahead of those of the previous year, cracks began to appear in the OPA's over-all ceiling.

Fighting hard to hold the line, OPA was forced to make "adjustments"—increases in ceiling prices so that necessary commodities could continue to be sold. Most of these were accomplished by the expedient of removing the affected group of products from the confines of "General Max" and setting it up in a separate regulation with provisions that lifted the ceiling above the levels of March, 1942.

Retreat in each case was made grudgingly and only after OPA had exhausted every weapon at its command. Two things were needed—return to parity and the use of subsidies. Congress had not acted on the president's request that the parity concept be restored and had not provided funds for subsidies.

Resumption of the rise in living costs did not go long unnoticed, and as the summer of 1942 waned it became more and more evident that demands for higher wages could not be resisted much longer. On Sept. 6 the president asked congress to furnish the administration with a revised and workable piece of anti-inflation legislation. In less than 30 days both houses passed an amendment to the law. Almost immediately the president created the Office of Economic Stabilization and drafted as its director James F. Byrnes, who resigned from the United States supreme court to accept the new post.

OPA again moved swiftly. Within 24 hours after the issuance of the new executive order, practically all of the hitherto exempt food items that had so nearly wrecked the price control program were brought under control. Many items covered at first by the General Maximum Price Regulation were later placed under individual regulations specifically tailored to the practices of particular trades and industries.

Rent control likewise moved ahead swiftly. On June 1, 194 the rents in 20 areas previously designated came under actual federal control. By October the list of rent controlled areas had increased to 190 and by Dec. 1 to 354.

Leon Henderson served as administrator of the OPA throughout 1942 but submitted his resignation in December. Prentiss Brown of Michigan was named early in 1943 to succeed him.

Prices.

Commodity prices in most markets throughout the world continued to advance during 1942. Widespread warfare on all the continents and on the high seas created exceptional demands for commodities and, at the same time, curtailed the movement of commodity supplies and limited the production of various commodities. The operation of these factors created unusual upward pressure on prices and price advances were moderated only by governmental controls.

In some countries prices were lower for commodities whose markets were curtailed. These instances were fewer than in 19 because, with the United States actively at war, heavier purchases were made in Latin America, Africa and the South Pacific to the raw material needs of the United States and for financial a to those countries.

The United States during 1942 joined the major countries which had previously undertaken broad national control over commodity prices. In certain of these countries, where exceptional economic conditions had strained their resources, as China, France and Italy, national measures to restrain price nces appeared to have been ineffective.

In most countries prices and fiscal problems generally were garded, in view of military events, to be of subsidiary impornce. Price changes to determine distribution of commodity supies were generally replaced by direct allocation of industrial aterials and equipment, and by rationing of essential consumer ods. Conversion of manufacturing and transportation facilities war purposes, use of raw materials and foodstuffs for military eds, and naval blockades sharply reduced supplies available for vilians and living costs rose steadily.

United States.—Commodity prices in the United States conued to advance rapidly during the early part of 1942, as shown figs. 1 and 2. War appropriations, which totalled about $65,0,000,000 in Nov. 1941, doubled soon after the United States tered the war. Actual war expenditures expanded sharply witht a corresponding rise in taxes or savings. Consumers and instrial buyers bought heavily at that time with purchases often ing made for protection against further price increases and ssible scarcities. To maintain orderly price conditions, a gen.l maximum price regulation was issued at the end of April to it wholesale and retail prices of most goods and services to highest levels reached in March. Maximum rent ceilings were up for an increased number of localities in an effort to staize the cost of living.

Prior to this action, authorized by the Emergency Price Conl act of Jan. 1942, maximum price controls were largely on ected basic materials and products at wholesale. They were igned to limit increases in manufacturers' costs and thereby irectly to hold down the cost of the defense program and the t of living. After the United States entered the war, action s broadened to include ceilings on wholesale and retail prices certain consumer goods, like automobiles, tires and electrical pliances, production of which had been discontinued or re.cted by the war program. It was evident, however, that the jor cause of the rise in prices of civilian goods was the growth consumer incomes rather than the rise in manufacturers' costs. nsequently, price increases in retail markets could only be preited by direct control.

The general regulation controlled retail prices of approximately)-thirds of the leading cost-of-living items. A number of foods e exempted, however, including fresh products which were ticularly difficult to control or other products which were sely related to prices of farm commodities that were allowed rise further according to the provisions of the Price Control . For several months after the general regulation was issued, ces of farm products showed little change. This reflected a kening in speculative interest, marketing of large crops, and idation of accumulated stocks of processed farm products. August mounting consumer incomes were reflected in the rkets for farm products, which were in short supply, and ces began to rise again.

Retail prices of uncontrolled foods and wage rates, also, coned to advance during the summer, resulting in new legislation Oct. 2, 1942, authorizing the president to issue a general order oilizing prices, wages and salaries, affecting the cost of living. s legislation permitted the establishment of maximum prices farm products and their manufactures at levels lower than vious statutory limitations. Controls which had covered retail es of 60% of the food budget were extended over 90% of the l. A tax measure was also enacted which called for a large ease in federal taxes, the bulk of which would represent a ndrawal of disposable income from consumers.

Prices of commodities other than farm products and foods e relatively stable during the year, as shown in the table, owing part to the broad extension of price controls. Another important factor was the high level of stocks of many consumer goods. Output of most civilian goods had continued at a high level after the beginning of the year. By the time production was curtailed in selected lines, heavy stocks had been accumulated by producers, distributors and consumers. Particularly during the latter half of the year a greatly increased proportion of expanding consumer income went into savings, chiefly by purchasing war bonds, paying off instalment and other debts, and accumulating currency and deposits. This withholding of current income from expenditures on consumer goods limited the rise in the cost of living to about 10% during the year. Supplies of most consumer goods, except metal and rubber products, were still generally available at the end of 1942 although scarcities were increasingly apparent, including some important foods. Rationing programs had been adopted to provide equitable distribution of scarce essential commodities.

United Kingdom.—Commodity prices in the United Kingdom were more stable in 1942 than in 1941, as shown in figs. 1 and 2. To a greater extent, however, price quotations were nominal and price indexes failed to reflect the restricted supply of civilian goods more than in the previous year as rationing and other controls over the distribution of resources were increased.

Most of the direct price controls and other measures indirectly affecting prices undertaken in the earlier years of the war were broadened and improved in 1942. Steps to assure production and distribution of essential goods like utility clothing at reasonable prices became an important factor in the markets. Receipts of large supplies of foodstuffs from the United States under lend-

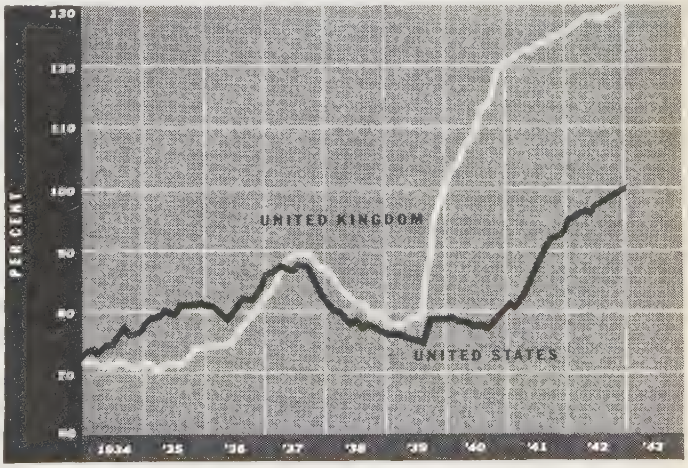

Fig. 1.—WHOLESALE PRICES IN THE UNITED KINGDOM AND THE UNITED STATES, 1934–42 (Source: United Kingdom—Board of Trade, converted to 1926 base; United States—Bureau of Labor Statistics). War conditions in the United Kingdom made many price quotations nominal; undoubtedly the index for that country understates the price rise after August 1939

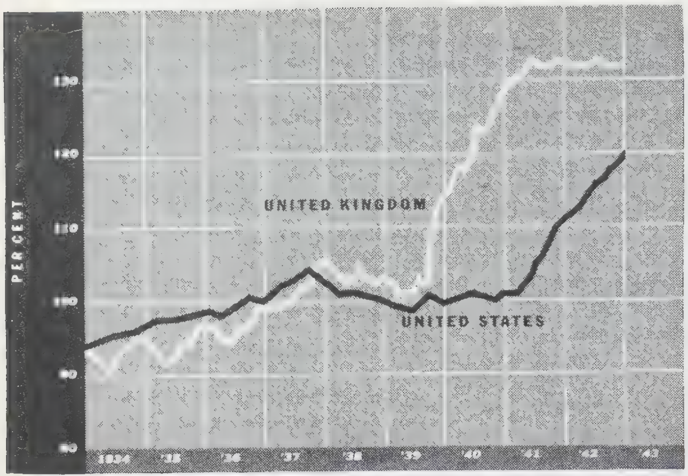

Fig. 2.—RETAIL PRICES IN THE UNITED KINGDOM AND THE UNITED STATES, 1934–42. (Source: Cost of living indexes. Ministry of Labour, converted to 1935–39 base, first-of-month data; Bureau of Labor Statistics, mid-month data, selected dates before Sept. 1940.) Because of the war, the price rise shown for the United Kingdom after 1939 and, to a lesser extent, for the United States after 1941, is probably understated.

lease were of primary importance in the retail food price situation. It had been announced that arrivals of these foods totalled 1,000,000 tons in 1941 and the tonnage probably increased considerably in 1942, particularly of high protein foods. This development, the continuation of food subsidies, and the increased prosecutions (4,150 in October) of distributors violating food orders resulted in some reductions in retail food prices in 1942 as compared with 1941. These reductions were offset by increases in retail prices of fuels and other commodities and the total cost of living showed little change. Prince Edward Island.

The smallest of the Canadian provinces lies in the Gulf of St. Lawrence. The island is about 130 mi. long, and has an average width of 21 mi. Pop. (1941) 95,047. The largest city is Charlottetown (14,460), the provincial capital. The island is separated from the mainland by Northumberland strait, which is crossed regularly by powerful railway ferry boats. Communication is also maintained by the Trans-Canada Airway service, which in 1942 provided two round trips daily between Charlottetown and Moncton. In 1940, 1,297 passengers were carried by aeroplane. The climate of the island, tempered by the Gulf of St. Lawrence, is moderate. Agriculture is the principal industry, all but about 15% of the total surface of the island being arable. The total estimated value of farming in 1940 was over $13,000,000. The most profitable crops grown were hay and clover, valued in 1941, at $3,680,000; potatoes at $2,414,000; oats at $2,116,000. Prince Edward Island was the original home of silver fox farming, experiments in breeding dating back to the early 19th century. While the fox farming industry scarcely occupies the place it once did, in 1938–39 the island produced 70,420 pelts valued at over $1,000,000. Another industry of considerable economic importance is fishing, which in 1940 produced a return of $714,870. Charlottetown is the seat of Prince of Wales college and also of St. Dunstan's university, the latter being a Roman Catholic institution. (J. I. C.)

Princeton University.

An institution of higher learning at Princeton, N.J. During 1942—its 195th year—Princeton once again girded itself for war. I adopted a year-round schedule to speed up the training of under graduates, introduced emergency courses to give instruction i particular war skills, instituted a physical fitness program, co operated with the reserve programs of the armed services an installed an information service to keep students abreast of th man-power plans of the government. Its faculty member pursued war research and served in advisory capacities to govern ment agencies. It provided accommodations for an army post ex change school of 250 men and a naval training school of 800 men

The year was also marked by reshaping of the curriculum to war needs; establishment of a department of aeronautical en gineering; expansion of geological engineering; introduction of program in American civilization; and adoption of a tutorial pla to remove the causes encouraging resort to commercial tutoring Robert Garrett gave to the university a distinguished collectio of books and manuscripts. President: Harold W. Dodds. Fo statistics of enrolment, faculty, endowment, etc., *see* UNIVER SITIES AND COLLEGES. (H. W. Do.)

Principe: *see* PORTUGUESE COLONIAL EMPIRE.

Printing.

Restrictions on machinery brought offerings of im portant new equipment during 1942 to that irre ducible minimum, nothing. Inventors, however, were reported t be busy. Photocomposition of "type" to supplement typecastin and typesetting machines utilizing metal, reported heretofore promised to become a practical reality at war's end. Experiment in use of plastics to replace type metal (largely lead) in castin linotype slug lines also were reported. During 1942 Du Pon announced types made from Nylon—like plastic, a carbohydrat material—to be unavailable for the duration.

An important development of the year was a compositio plastic and processed paper press plate for offset printing. Th plate, flexible with a glazed surface, is composed of equal part of paper and plastic, the latter forming the printing surface, th paper, flexibility. The new material effects a considerable savin in costs. While some in the trade did not regard the materi equal to zinc and aluminum heretofore used for the purpose WPB officials were said to, especially for plates 22 x 29 in. an smaller. One government executive reported a single run o 100,000 from such a plate.

Printed reproductions of full-colour paintings were accom plished with separate plates for yellow, red and blue values, als one for black to provide tones and shadows. Full-colour copy i photographed once for each plate, using a colour filter whic eliminates the reds and blues, as the camera sees the painting when making yellow plate, *et cetera,* for red and blue plates. A best the method was imperfect, artists correcting inaccuracie by hand. The Kodak Fluorescent process, developed in 1942, im proved on the method, speeded the making of plates. Picture are painted in water-colour paints which fluoresce in ultraviole light. This fluorescence so improves the red and yellow that colou correction is virtually perfect. Although invisible in ordinary light the bright fluorescence, which fully effects colour correction in re and yellow, makes a striking display in a darkened place unde strong ultraviolet rays. Photography for blue and black plates i accomplished, however, with white light only falling on copy.

Another outstanding contribution to the betterment of lithog raphy was the latest contact screen produced by Eastman Koda company. For fidelity it was said to be the nearest thing to con tinuous tone reproduction—that is, most like a genuine photo graph. It is also more efficient, requiring but one piece of fil or one dry plate. Time of making negative is much shorter control need be exercised over only one exposure to one film ead of two. The final result of the first process was a positive l required another contact exposure to produce a negative en it was used on albumen plates. By this new method a half- e negative is produced.

'hotoelectric colour-register control applied to supplements of vspapers printed on rotary presses, which decidedly reduces tage resulting from out-of-register colours, was not new. As etofore used the automatic colour register was applicable to a ss making an eight-page colour supplement. It was frequently ıd desirable to make sixteen-page supplements, folded, stitched trimmed as a book. Such sixteen-page sections heretofore to be combined by hand from the output of two presses, a tively slow and costly process. During 1942 a method to com- , by means of photoelectric register control, the output of presses was developed. While the inside eight-page section ıot be seen by the inspector, his inspection is not required.

nting Office, U. S. Government.

The office was established by au- rity of Congress in 1860 to execute printing and binding for executive and judicial departments and the court of claims. functions extend to all branches of the government and in- e the sale of official publications, reports and technical bulle- Many of its publications are printed in foreign languages find circulation in other countries. The total area occupied he government printing office (including rented space) in 1942 1,457,138 sq.ft., or 33½ ac. The value of the government ting office buildings proper was $9,634,825; machinery and pment $6,143,484, making the total value of the plant $15,- 309. At the end of the fiscal year 1942 there were 8,216 loyees on the rolls, with a pay roll of approximately $19,- 000. The office produced a total of 365,456,048 publications l classes. This total included 9,789,638 copies of the *Congres- al Record,* 5,502,258 copies of specifications of patents, trade- ks, designs, etc., and 258,743 copies of the *Official Patent e Gazette* and annual indexes. Postal cards delivered unted to 2,465,498,000; money orders delivered, 278,106,600; tores division handled approximately 4,632 carloads of paper. ing the fiscal year 1942 the division of public documents ed out 622,736,070 publications and forms; its receipts from sale of government publications during the year amounted to 12,539.28. The total value of all printing done was $46,- 343.90.

(A. E. Gi.)

rities and Allocations.

The rush of U.S. industry into high volume produc- of war materials brought on severe growing pains as the year progressed. The principal causes of production troubles med from rapidly developing shortages of vital raw materials failure of established systems of control to force the best of available materials.

early fall it was apparent that a new method of handling ities and allocation of raw materials was necessary and one worked out by responsible government officials and industrial ers. This new system, announced Nov. 1, 1942, was the rolled materials plan. It was hailed as the most advanced yet taken in the United States toward an all-out war econ- With the experience gained under previous systems of rials control to guide its sponsors, the plan approached the lem from a new angle. It was based on allocation rather than priority system to achieve an ordered flow of vital raw rials to war plants.

the beginning of 1942, the old priorities system was still in . Under that plan, preference ratings were issued to insure that materials and components went first to essential production. However, preference ratings could do nothing to correct a more basic difficulty.

Some manufacturers, more favourably situated in certain respects, were able to turn out their products at much greater speed than others; in fact, the government unconsciously encouraged this lopsided production output by awarding honours to plants making outstanding records of production. Soon it became apparent that while there was a plethora of some essential war products there was a dearth of others. In many respects, the over-all war production effort was slowing down because of the unequal distribution of material and the unevenness of production of parts by different parts manufacturers. For example, a machine gun plant might be far ahead of schedule with guns for combat planes but the maker of engine parts for these same planes might be lagging behind schedule because the steel he needed had been used by the gun manufacturer, or was part of an over-ample inventory in some other war factory.

The inadequacies of this method of materials distribution had been realized late in 1941, and a new system—the production requirements plan—had been devised. Going into effect during the first quarter of 1942, this plan afforded some relief, but subsequent results proved that it was not the "ultimate plan" that some of its sponsors had hoped it would be. Under the PRP the individual manufacturer estimated his requirements for three months in advance and WPB, taking into consideration his estimate and the amount of material he had on hand, attempted to insure him sufficient materials to meet his production needs. Under a ruling issued in June 1942 it became mandatory for companies using more than $5,000 worth of certain critical materials a quarter to come under PRP. By Oct. 1, approximately 30,000 manufacturers were operating under this plan and their applications for materials constituted a report of about 95% of war industry's basic requirements. Under PRP the manufacturers were permitted to receive up to 40% of the total quarterly allotment during the first month, 40% during the second month, and 20% during the third month, these percentages being cumulative.

The baffling problem of bringing war production into balance and making the best possible use of all available material and facilities was not solved by PRP, because PRP provided no means of forcing each plant to operate on definite, approved schedules.

Inauguration of the controlled materials plan for regulating the flow of vital materials into war production—or into essential civilian production—did not do away immediately with the preference ratings or allocations under PRP. The controlled materials plan was designed to go into effect gradually, becoming fully operative beginning July 1, 1943. The CMP came as nearly as any conceivable program at the time of its adoption to composing the differences between the various elements involved directly in wartime production. Adoption of the plan resulted from careful study of the methods formerly employed in the United States and those of other nations and of the difficulties to be overcome. It was the outcome of painstaking conferences between army, navy, marine commission, WPB, and the Office of Civilian Supply, as well as representatives, consumers and producers of materials.

The first metals to come under the allotment control of the new plan were steels, copper and aluminum. The assumption seemed to be that any production program maintained within the available supplies of steel, copper and aluminum would not be likely to encounter immediate shortages of other materials. During the transitional period, these three controlled metals were to be delivered in accordance with both allotments and priority ratings. After July 1, 1943, deliveries of these three metals were to be prohibited except in accordance with allotments. Materials not on the controlled materials list continued to be distributed through the priorities system. Technically, CMP was a "shift from horizontal to vertical material control." Prime contractors presented "bills of materials," specifying not only what materials were required but when they must be received in order to fulfil scheduled deliveries. The bills of materials included all materials needed by subcontractors and their suppliers as well.

The requirements committee of WPB, which made the broad, final allotments, dealt through army, navy, maritime commission, aircraft scheduling unit (agent for army air forces and bureau of aeronautics), lend-lease, Board of Economic Warfare, Office of Civilian Supply and other agencies. These agencies were made responsible for the actual apportionment of the materials. They were known as "claimant agencies." When requirements of manufacturers and the agencies were brought into balance with supply and finally approved, then the WPB vice-chairman on program determination, who was also chairman of the requirements committee, allocated to each claimant agency authorized quantities of the controlled materials, and the agencies in turn handled the distribution among the prime contractors. Distribution was facilitated through the use of "allotment numbers," which constituted a right to receive delivery of materials.

Products were divided into classifications A and B. Custom-built products for the armed forces or other claimant agencies, such as guns, tanks, ships and planes were included in class A, and allotments for their manufacture were received direct from the claimant agencies. The class B list was made up of items such as nuts, bolts, small motors, other standard parts and maintenance and repair products for both industrial and civilian use. Materials for these products were allotted to manufacturers by the various industry divisions of WPB.

Each company receiving an allotment number carrying an allocation of controlled materials also received a preference rating for use in obtaining other materials. During the period of making the change-over from one system to the other, existing procedures, including preference rating orders and PRP certificates and individual material allocations under "M" orders were continued in effect for consumers who had not been able to qualify under the controlled materials plan.

During 1942, the compliance division of WPB checked the operations of some 50,000 business firms, and nation-wide surveys were made with the aid of investigators assigned by other federal agencies. More than 18,000 suspected violations of priority orders and regulations were investigated and 7,500 PRP firms were audited. Warning letters brought about desired results in 4,500 cases of significant or wilful violation of regulations, but 32 criminal and 10 civil cases were referred to the department of justice for appropriate legal action. In addition, the War Production board itself issued nearly 200 penalty orders against offending companies. The penalties imposed for the most part consisted of denial of priority assistance and allocations of restricted materials for periods of time ranging from three months to one year. The compliance division held 252 meetings during 1942, at which the workings and requirements of the priorities system were explained to approximately 150,000 industrialists.

Shortage of manpower and materials, which were urgently needed in the production of war munitions for immediate use, had its effect on the building construction program that had been planned for 1942, for it was necessary to divert both men and materials to the more pressing need. Notwithstanding, necessary building went on at a furious pace. Military housing for more than 250,000 men was provided in a single month, aeronautics construction reached $250,000,000 a month, more than $400,000,000 went into war factory buildings in one month, and an average of 40,000 residential units was built each month. T 1942 construction program consumed approximately 13,000,c tons of cast iron and steel in the form of finished products whi means that it took a pig and ingot capacity of 18,000,000 to It took about 180,000,000 bbl. of cement, nearly 160,000 sh tons of copper in finished products, nearly 190,000 short tons lead, nearly 75,000 short tons of zinc and more than 21,000,00 000 bd.ft. of lumber. This summary merely hints at the probl of priorities and allocations involved in the construction progra in 1942.

Toward the close of 1942, it became necessary for the chairm of the War Production board and the secretaries of the war a navy departments to issue jointly a directive on constructi establishing principles for curtailing facilities expansion. In so instances entire projects were discarded; in others, projects we reduced in size. Much building scheduled for 1943 was ca celled. Material that would have gone into such buildings w allocated to facilities needed immediately for the manufactu of munitions currently behind schedule.

(M. P. Q.)

Prisoners of War.

World War II brought the first test the international agreement regardi the treatment of prisoners of war, developed at Geneva, Switz land, in 1929 by delegates of 47 nations and subsequently ratifi by most of the nations represented. Demonstrating the need f such a convention is the fact that an agreement between G many and the United States for the treatment of prisoners duri World War I was not arrived at until the morning of Nov. 1918.

In general, the convention provided minimum standards f the treatment of prisoners of war. Food was to be equal to th of troops of the detaining power at base camps. Sanitary a medical facilities were to be provided. Prisoners might be he in compounds but not individually confined except under usual circumstances. Officers received pay, generally on the sa scale as officers of corresponding rank in the army of the deta ing power. Prisoners other than officers might be required work with pay at an agreed-upon rate, but the work should ha no direct relation with war operations. Representatives of t protecting power might visit camps. Facilities for the exchan of correspondence with relatives at home were to be provide and prisoners were allowed to receive parcels. Such correspon ence and parcels were exempt from all postage duties. The co vention further provided for the exchange of information abo prisoners through information bureaus in each of the belligere countries and a central information bureau.

Two major belligerents in World War II did not ratify t convention, Russia and Japan. Russia stated that she was appl ing the standards of the Hague convention of 1907, which h no provision for neutral observation of prison camps or for t exchange of names of prisoners. In Jan. 1942 Japan agreed abide by the terms of the convention but without formal ratifi tion. (*See* also Red Cross.)

During 1942 reports of the delegates indicated that, in gener the terms of the convention were being observed, although names of only a few of the prisoners taken by Japan had be officially reported, nor had Japan yet accorded facilities for t regular shipment of supplementary supplies to prisoners in t far east. Neutral representatives of the Young Men's Christ association had also been given permission by most of the bell erents to visit camps to assist prisoners in educational, recr tional and religious activities.

No official figures were available by nationality for the total mber of prisoners during 1942. Unofficial information indi- ed, however, that there were about 4,000,000 such captives. issian prisoners were estimated at 1,800,000 in Germany and ,000 in Finland. The next largest group appeared to be French d by Germany, reported at 1,084,000. The number of German soners held in Russia and the various British dominions was available although there were 23,000 German prisoners re- rted in Canada. It was estimated that Britain was holding ne 300,000 Italians in India and the Libyan campaign of late 2 had resulted in the capture of an additional 100,000. Re- ts indicated that in addition to French prisoners, Allied pri- ers in Europe included 142,000 British, 500 Americans, 140,- Yugoslavs, 70,000 Belgians, 56,000 Poles, 2,000 Dutch, 00 Greeks and 300 Norwegian seamen. It was also estimated t there were 282,000 prisoners held by Japan, including some 000 members of the U.S. forces other than Filipinos.

The detaining powers determined the form and frequency of respondence which prisoners might be allowed to send. Pri- ers held in the United States were allowed two letters and one t card per week. Usually the number of letters which prisoners ght receive was not restricted. Mail and parcels sent through tal channels were handled without charge, although a route parcels to the far east was not available during 1942. In- uctions for communicating with and sending parcels to pri- ers were changed occasionally but in the U.S. the latest in- mation was obtainable from post offices, Red Cross chapters the office of the provost marshal general, Washington, D.C.

Supplementary food, uniforms, tobacco, medical supplies and nfort articles were sent regularly to prisoners through the In- national Red Cross committee by Red Cross societies and governments. Distribution was supervised by the international committee and receipts were returned to the senders. Although some supplies for prisoners in the far east were carried on the diplomatic exchange ships during 1942, no regular shipment was developed principally because of Japanese refusal of safe conduct for neutral vessels to carry such supplies. Efforts to overcome these difficulties were being continued by the Red Cross and the government. (*See* also INTERNATIONAL LAW; RED CROSS; WAR RELIEF CONTRIBUTIONS.) (P. E. R.)

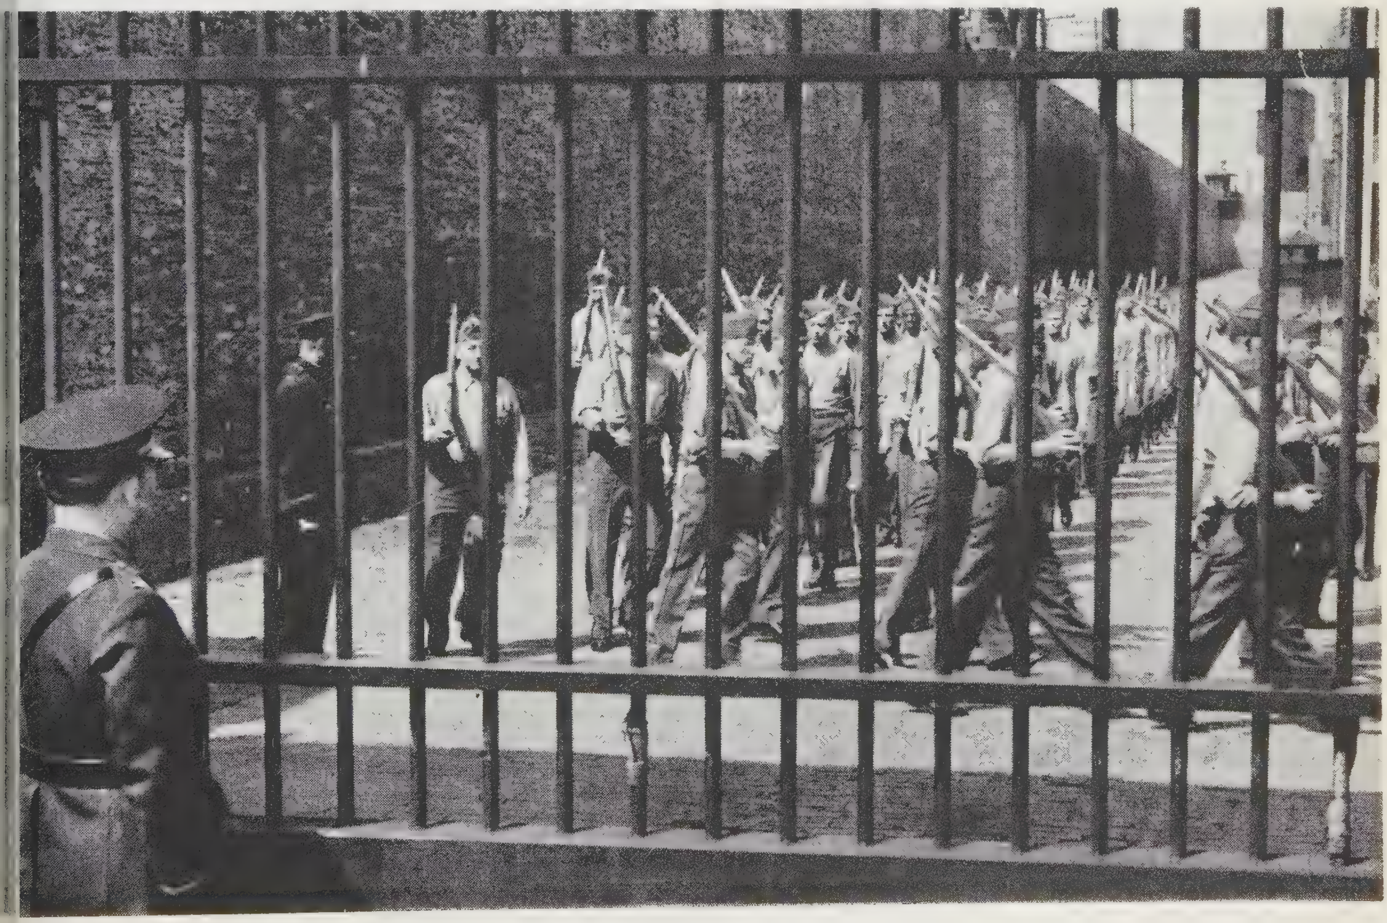
Prisons.

Because of the war and the consequent restrictive use of vital materials, no new buildings were erected in prisons in the United States during the year 1942. However, at the Federal Reformatory at El Reno, Oklahoma, a factory, construction of which started in 1941, was completed. Inmates in all federal institutions and most state prisons manufactured many articles for the army and navy. In fact, in some prisons, the men and women worked on two to five shifts, and their enthusiasm indicated beyond doubt that patriotism, not compulsion, motivated them. Tents, clothing, brushes, brooms, tarpaulins, blankets, tools and rope were some of the commodities produced. And at the McNeil Island penitentiary, on Puget sound, federal inmates constructed 65-foot motor patrol boats in the prison shipyard, the first project of its kind in the country.

Prisoners also supported the war effort wholeheartedly in other respects. They purchased thousands of dollars worth of war bonds from their paltry earnings in prison industries, frequently giving up the little luxuries that they are permitted. And in many institutions, they willingly gave their blood to Red Cross units.

In some states, *e.g.* Ohio and California, the men were allowed to engage in military drills, and using only dummy weapons, prepare for possible service in the army. In many other states, they grew food on prison farms, and in Oregon, they worked in prison

SONERS OF OHIO STATE PENITENTIARY formed a voluntary drill unit in 1942 to prepare themselves for military service after their release



lumber camps. Inmates from the federal prison camp in Montgomery, Ala., performed many important chores at Maxwell Field, an army post in that city.

Released felons were no longer barred from the army, provided their offenses were not of the more heinous type, *e.g.* murder, rape. Kentucky enacted a law permitting the parole of prisoners for military service or farm labour. The act suspends, for the duration, the statutory requirement that men serving sentences of ten years or less must serve at least one half of their terms before being eligible for parole. New Jersey, Michigan, Oklahoma and Texas passed similar acts, thereby giving men behind bars an opportunity to serve their country, if they could show beyond doubt that they were physically, mentally and morally healthy. Other states were expected to adopt this same policy.

A 3.3% increase in crime during the first quarter of 1942 was reflected in the reports received at the Federal Bureau of Investigation from 354 cities, with a combined population of 47,422,481. Rape, felonious assault, and larceny showed the largest upsurge; the net change for robbery was negligible, and burglary showed a decrease, as compared with the same period for 1941. But while official reports were meager, unofficial reports from various law enforcement and social agencies indicated that in 1942 there was a marked increase in juvenile delinquency, a result, no doubt, of conditions created by the war.

With the exception of England, no information was available about crime and prisons in Europe. That country, which reported an increase of juvenile delinquency for 1941, reported a decided decrease for 1942. That was due to the fact that steps were taken to provide adequate recreational and educational facilities for children whose parents were engaged in war work, and for youngsters who were evacuated to places where they were deprived of a normal home environment.

Production Research and Development, Office of.

The Office of Production Research and Development was established in the War Production Board (*q.v.*) by Chairman Donald M. Nelson on Nov. 9, 1942, with Dr. Harvey N. Davis as director.

In essence, this office was set up in order that production of war goods could be aided through the most rapid appraisal and the speediest and most effective utilization of available processes, materials, mechanisms and inventions. In the production field it parallels the work done for instruments of war by the Office of Scientific Research and Development (*q.v.*).

The principal functions of the Office of Production Research and Development were outlined as follows:

To provide the chairman of the War Production board with technical information on problems directly concerning him, and on research and development work in progress in the War Production board; to provide the various operating divisions and branches of the War Production board with research information and findings.

To initiate the evaluation and analysis of specific scientific or technological proposals, through the establishment of expert committees or through reference to research groups in government, education or industry.

To get needed research accomplished by contracting with outside laboratories or agencies for experimental work.

To bring about development of such processes or projects a merit it, either through contracting for the construction of prototypes or through the erection of pilot plants.

The director of the Office of Production Research and Development was charged with initiating such technical evaluation research and development work as would in his judgment advance the war program. (H. N. Ds.)

Proportional Representation.

"Proportional representation," writes Prof. T V. Smith, University of Chicago, in his *Promise of America Politics* (1936), "would raise representatives above the provincialism of local communities without destroying localism itself . . . would not only give minorities a voice up to the level of their real strength, but . . . would keep the majority efficient up to the level of its strength. No vote would be thrown away but every vote would be counted for its full weight in the total field. It would automatically adjust the conflict between functionalism and regionalism by permitting effectively to operate at elections whatever resolution this conflict had reached in the mind of each voter. But basically and finally . . . it leaves nobody, no territory, no interest, no basis of choice unrepresented." The American Labor party, said the *New York Times,* editorially, on Aug. 25, "is the child of Proportional Representation; its successes in election to the city council have been largely possible through Proportional Representation." The *Times* had not been so friendly to proportional representation and the import of this concession was understandable only by recalling that the party provided a balance of power in New York which had rendered possible a change, in the metropolitan government, from machine rule to nonpartisan administration and, in the state government (at the 1942 election), from two decades of domination by a single party. The attempt to repeal the city's charter provision for proportional representation proved unsuccessful, the petitions for a referendum being judicially found insufficient. A similar attempt in Yonkers, however, reached the voters on Nov. 3.

Two substitute plans were offered them: (1) for a council of 11 members, 5 at large and 1 from each of six districts (rejected, 24,143 to 12,975); (2) for a council of 9, 3 at large and 1 from each of six different districts (rejected, 24,158 to 11,761).

Each plan included a mayor and vice-mayor to be chosen by the council, but gave the voter only one choice of candidates.

Protestant Episcopal Church.

The 125 parishes and missions of the Episcopal Church in Japan became an independent Japanese church and their statistics were therefore not included in the annual reports.

The statistics for 1942 in the United States showed an increase of 77 in the number of clergy, the number reported being 6,277; the number of communicants reported was 1,508,894, a decrease of about 10,000; the number of confirmations was 67,470, a decrease of 2,630 as compared with the year preceding; the total number of baptized persons was 2,168,164, an increase of 6,142. The contributions for the year totalled $35,311,31 This showed an increase of $1,640,952, which was due in large part to the sums given for emergency needs caused by the war

Pryor, Arthur (1870–1942), U.S. bandleader, was born Sept. 22 in St. Joseph, Mo., the son of Samuel D. Pryor, founder of Pryor's Silver Cornet band. His father and mother, both gifted musicians, began his musical education when he was an infant. He could play the drums at three years of age, and the piano at six. Before he was given his first trombone at 17, he was already a skilled musician playing the cornet, alto horn and bass viol. He joined Sousa's band at the Chicago World's Fair, 1893, and made three world tours with the "March King" as premier trombone soloist and assistant conductor.

In 1902, after his father's death, he took over Pryor's band and gave his first concert in New York city the next year. He continued with the band until his retirement 30 years later. Pryor composed about 300 musical works, including several light operas.

He died in West Long Branch, N.J., June 18.

Psychiatry. **Civilian Reactions.**—The effect of air raids on the civilian population was reported by numerous authors in England. Vernon pointed out that there was at no time widespread panic. In general, the population soon became acclimatized, particularly to heavy attacks at night, and many managed to sleep throughout the raids. Persons who went to shelters might become more nervously upset by inaction than by the actual effect of the raid, and the presence of group leaders showing activity was a marked factor in overcoming fear among civilians. Where raids were heavy, the effects on individuals were due more to excessive fatigue, dislocation of normal living, lack of sleep and improper diet than to the actual effect of the raids themselves. There developed no psychiatric syndrome which could be deemed an "air-raid neurosis." In general the psychological disorders associated with air raids were much less serious than the social disorganization consequent to the destruction of homes, the dislocation of communications and similar effects. Children were less affected than adults. Patients with mental disease were often impervious to the effect of raids and epileptics showed no increase in fits. Lewis reached similar conclusions and felt that on the whole air raids had not been responsible for any striking increase in neurotic illness. There were some acute forms of reaction such as anxiety, depression and a moderate amount of hysteria. Most patients, however, with these symptoms recovered rapidly and the study by Wilson would indicate that the large majority of those who were hospitalized were able to return to their normal life within one or two days.

That the nervous system is often seriously disturbed, however, is brought out by the studies of Stewart and Winser on the secondary effects of air raids in an increased incidence of perforation of gastric ulcer. This serious complication arose particularly in the period when the air raids were most active in London during Sept. and Oct. 1940. The authors found, in times of peace, that slightly more than 20 patients a month were admitted to London hospitals with perforations of gastric ulcers. During Sept. and Oct. 1940, the admission rate was over four times this average. The factors that were considered as causative were anxiety, dietetic difficulties, increased smoking and drinking, and possibly bacterial infection; but the authors felt that anxiety was the main factor predisposing to ulceration and perforation, thus linking the psychological effects of the air raids with the development of a serious gastric complication.

The more general aspect of air raids was also studied by Vernon. He found that people living in heavily bombed areas and who had a good knowledge of the war and its general purport were particularly free from symptoms and, in fact, had the highest morale of the whole group. Air raids tended to reduce irrational attitudes and even caused an increase in war effort. At no time did the raids tend to inhibit activity, and bombing and danger both encouraged thinking reality. The raids, therefore, tended to make good citizens better and few grumblers and critics were found in areas where extensive bombing had taken place.

Psychiatry in the Armed Forces.—Duval and Hoffman examined a considerable number of patients with mental disease from the military services. They found that about two-thirds of the patients presented schizophrenic symptoms and they contrasted these findings with those ordinarily encountered in civilian life. Their principal finding is that in military life the onset of the schizophrenic episode is often explosive, the patient showing panic states with aggressive tendencies, acute depressions with suicidal drives and other marked symptoms. Although the reaction is a serious one, it is often brief and there is a large percentage of recoveries, more so than in civilian life. The patients present symptoms suggestive of marked hysteria rather than schizophrenia. The authors found that nearly half of their patients were well enough in a few months to be discharged from the hospital.

The question of seasickness in navy personnel had never been thoroughly studied from the point of view of psychiatry. The work of Schwab called attention to this important field of investigation. He found that there were two rather definite types of patients with seasickness. One was constitutional; with a strong and uniform history of nausea and vomiting when riding in cars, trains, buses, on swings or roller coasters. In this group the nausea and vomiting are often initiated by the sense of smell or of taste; the sight of blood may cause an attack. Similar symptoms occur during periods of intense emotion or anxiety. The second group of patients are those that are seasick but do not have the symptoms noted above. In this group there is no nausea or vomiting from emotional situations. The patients in the first group are in general of the psychoneurotic type, unstable individuals readily showing evidence of neurotic character. It is in this group that efficiency at sea is extremely low and no amount of effort towards keeping the officers or men at sea will overcome their extreme seasickness. The second, or milder type of seasickness, although it recurs with considerable frequency and is often not entirely curable, is best treated by transfer to larger ships or in some cases, land duty. A large percentage, moreover, of gastro-intestinal abnormalities were found in this group, some of which might be corrected by operation or other types of treatment. The author found no correlation with the patient's background, race or body type in either form of seasickness.

Schizophrenia.—There is considerable resemblance between pictures drawn by primitive man and the drawings made by patients with schizophrenia. Gutiérrez-Noriega found that the symbolic pictures of ancient Peru are closely similar to the drawings presented by his patients of the Indian race. So many characteristic symptoms of schizophrenia, moreover, find a counterpart in the behaviour of man at the earliest genetic levels that Osborne has suggested a new name for the disease, "palaeophrenia."

The differentiation of patients with schizophrenia between those that are likely to recover and those that will not has been investigated by Gottlieb and Hope, by the use of the drug, sodium amytal, given intravenously. The group showing a good reaction to this drug has a large percentage of social recoveries and conversely, of 61 patients showing a poor reaction, 53 were unimproved.

Shock Therapy.—Various forms of shock therapy continued as a form of treatment in most hospitals in the U.S. and abroad. Kalinowsky made a survey of European centres and he found that insulin, metrazol and electric shock were all being used, there being no distinct preference for any one of them. There wa feeling among psychiatrists that shock therapy has a definite pl in the treatment of mental diseases.

Alcoholism.—In 1940 the treatment of alcoholism by est lishing a conditioned reflex along the lines developed by Pav was instigated by Voegtlin. Certain nauseating drugs were lized to elicit an unconditioned reflex of nausea and vomiti The sight, smell or taste of alcoholic beverages serves as conditioned stimulus. When completely developed, all alcoh beverages will stimulate the reflex and thus a state is produ for the conditioned stimulus amounting to a strong and defi aversion to the sight, smell or taste of liquor. The treatment undertaken in a hospital where the patients stay from five seven days under especially prepared surroundings. The resu were satisfactory. A later report by Voegtlin indicated that some cases a reinforcement of the treatment is necessary wit a period of months.

Psychology.

In keeping with the demands of a total w U.S. psychologists were enlisted on many fro during 1942. Their main concentrations were in two areas: training and selection of military and governmental personnel (2) social research concerned with morale and psycholog warfare. Contributions in these areas came both from psych ogists in governmental service and from universities whose search had been oriented in the direction of war needs.

The work of social psychologists was funnelled through f main governmental agencies: (a) the Office of War Informat (*q.v.*), which in June 1942 took over the activities of the Of of Facts and Figures, (b) the research bureau of the special se ices division of the army, (c) the Office of Strategic Servi under the joint staffs of the army and navy which replaced Office of the Coordinator of Information and (d) the fore broadcasting monitoring service under the Federal Communi tions commission.

In the Office of War Information, psychologists were utili mostly in the bureau of intelligence, the research organization the domestic activities of the office. Their participation in preparation of informational campaigns in the United States elsewhere was slight, but they played a major role in the bur of intelligence. The purpose of the bureau was to advise operating bureaus of OWI as well as other governmental ag cies of the state of public opinion and the conditions underly opinion, so that the proper measures could be taken for the eff tive administration of governmental programs. The tasks ran in 1942 from the measurement of national morale to the test of incentive devices to speed war work in crucial industries.

Systematic attitudinal research to acquaint administrative cials with the problems they faced in carrying out their progr had been initiated in the government before World War II the division of program surveys under Rensis Likert of bureau of agricultural economics in the department of agri ture. With the setting up of the Office of Facts and Figures division of program surveys was expanded and was put to w on a contractual basis for OFF. This arrangement was ma tained when OWI replaced OFF, until Nov. 1942, when bureau of intelligence took over this type of activity direc Highly significant methodological contributions were made by sion of program surveys and by the bureau of intelligence to field of social psychological research. Through the use of ly skilled interviewers and through the development of new rviewing techniques, the statistical approach of the commer- pollers was effectively combined with the depth analysis of clinician. In their work, moreover, program surveys and the eau of intelligence went far in achieving an integration of the nces of psychology, economics, sociology and political sci- ; their studies not only were directed at the individual's re- ons but also at the relevant factors in the social milieu giving to individual opinions. In this integration, psychologists ked together with representatives of the social disciplines.

he research bureau of the special services division of the y roughly paralleled among enlisted men the work of the eau of intelligence among civilians in 1942. The special serv- division, originally called the morale division, was charged supplying the extra-curricular needs of the enlisted men for cation, entertainment, recreation and information. Under the ership of Samuel Stauffer, its Research Bureau was divided two sections. The experimental section under the Yale chologist, Carl Hovland, pretested educational and morale grams, and the surveys section under Professor Cottrell of nell conducted attitudinal researches with both written ques- naires and oral interviews to advise army officials of the sol- 's problems from his own point of view.

he Office of Strategic Services, concerned with certain aspects psychological warfare abroad, maintained a research bureau a psychology division headed by Professor Tryon. Psychol- ts in this division helped in collating and interpreting materi- on customs and habits of thought of peoples in axis and axis- pied countries. Research was of course highly confidential.

he foreign monitoring intelligence service under the Federal mmunications commission had started even before Pearl Har- to record and analyze the short-wave broadcasts of other ntries—a program initiated by the Princeton Listening centre. analysis helped other governmental agencies to understand cope with the propaganda offensives of the axis powers. One nple of its work appeared in the conviction of William D. ey for treasonable utterances. A comparison of short-wave dcasts from axis countries with an analysis of Pelley's paper he media division of the bureau of intelligence of OWI dem- rated that Pelley's publications were following the axis line. chologists such as Goodwin Watson and Otto Klineberg of mbia and Theodore Newcomb of Michigan figured prom- tly in the work of the monitoring service during 1942.

World War I, group psychological tests were employed for first time on a large scale for the classification of men. War- in 1942, however, consisted of many highly specialized tasks, e of them unknown in civilian industry. The problem, there- , had become one not only of dividing men into rough cate- es on the basis of intelligence, but also one of selecting and ing men for jobs requiring special skills and special emotional cities. To select the best men for these new demands requires lamental psychological research on the qualities of mind and erament involved in such difficult tasks as night flying and bombing. Hence the personnel problems of the armed forces ssitate the use of experimental or laboratory psychology to eater extent than was true in World War I. Thus, psychol- ts working in or for the armed forces were giving their atten- in 1942 to five main types of problems: (1) the placement nen through standard intelligence tests or slight modifications hem, (2) research on the types of reactions involved in com- operations, (3) the development of new testing methods, administration of training programs for the U.S. army and y, and (5) clinical work with members of the armed forces. The development of new testing techniques based upon fundamental experimentation was especially marked in the fields of aviation and naval service. More than 100 psychologists were on duty with the army air forces, a number of whom, under the direction of Lieutenant Colonel J. C. Flanagan, were engaged in discovering the physiological and psychological traits involved in different aspects of aviation. An important development was the acceptance by the navy of psychological methods for the selection, placement and training of men. A committee was set up under the auspices of the National Research council, with John Stalnaker as chairman, to aid in carrying out necessary research projects.

The activities of psychologists in full-time government employment were supplemented in 1942 by research projects carried on in the universities either on the advice of a governmental agency or on the initiative of the local psychologist himself. Research, for example, on the problems of sensory acuity under various conditions, on fatigue, on perception and emotion was in many cases oriented in the direction of making the maximum contribution to the war effort. In social psychology, research was cleared through the Society for the Psychological Study of Social Issues to coordinate individual projects with one another and with governmental needs. The research seminar in social psychology in many universities followed the lead of Gordon Allport of Harvard in investigating morale problems. Rumour clinics were likewise instituted in a number of cities by local psychologists both for purposes of studying rumours and of combating them. The second year book of the Society for the Psychological Study of Social Issues was entitled "Civilian Morale" and was devoted to bringing together and interpreting available material relating to morale.

The formal activities of U.S. psychologists were curtailed in 1942 when it was decided to dispense with the regularly scheduled annual meetings because of the undesirability of civilian travel in wartime. The council of the American Psychological association met, however, and proceeded with plans for a council embracing representatives from all psychological organizations to give more formal unity to American psychology. The Society for the Psychological Study of Social Issues held informal round tables in Sept. 1942 in place of its regularly scheduled meetings for those psychologists in Washington at the time. Topics discussed included techniques of opinion research, psychological warfare abroad, the selection of pilots, and the most effective use of psychological research facilities of the universities.

The year 1942 saw the creation of an Office of Psychological Personnel as an agency of the American Psychological association under the directorship of Dr. Steuart Britt, charged with "the maximum effective use of psychologists, irrespective of society membership, in the war effort." This office and the subcommittee on personnel of the Emergency Committee of Psychology which it replaced were in part responsible for the fact that the specialized skills of more than 500 American psychologists were being utilized by at least 40 military and governmental agencies by the end of 1942. Public Health Engineering.

Air Sanitation.—In Great Britain, the National Institute of Medical Research had under study for some time the special hazards associated with air-raid shelters and with emergency and overcrowded hospitals. The fear that extensive outbreaks of respiratory diseases might result from the overnight occupancy of crowded shelters happily did not materialize, and most of the extensive preparation for the use of masks and the disinfection of the air were held in abeyance. Van Den Ende and Andrews expressed the view that the control of dust by use of special floor material or by oiling, is perhaps the most significant single item of precaution.

In the United States, interest was centred in the development of ultraviolet light as a disinfecting agent, owing in part to a vigorous support of the movement by the lamp manufacturers. However, Robertson and associates continued their studies of aerosol mists and vapours. They found propylene glycol to be most advantageous and to give promise of exerting a minimum harmful effect upon the human occupants. On the basis of animal experiments alone, however, they were not willing to recommend this or any of the aerosols thus far suggested for routine use in crowded spaces.

The harmful effects of the pollution of the air of industrial establishments by dusts, fumes and vapours was also being emphasized by the increased demands for plant output, newly developed processes, and continuous 24-hour operation of plants. The subject of industrial sanitation, including air conditioning and ventilation, was stressed in special intensive courses given by several American universities to selected groups, including medical officers of the military forces. Here again, dividends were received upon long years of research, and those responsible for production realize as never before that plant output is a direct function of the well-being of the workers.

Water Supply.—The current literature in water supply again illustrated the change of emphasis due to war conditions. Of special importance was the development of methods for repairing air-raid damage to water mains. M. A. Carrington Wildsmith of the Manchester (Eng.) Water Works, described some of these methods. Organization for immediate action is essential. Often sewers and water mains are destroyed in the same crater. Rapid shut-off is essential to prevent flooding, often of nearby air-raid shelters. Thorough sterilization of the mains after emergency repairs is a primary requirement. Damage also may result through earth movement at some distance from the bomb crater. The author found no evidence thus far of the spread of disease following these emergency repair jobs. It was likewise reported, by the London Metropolitan Water board, that there had not been a single case of water-borne infection following air raids in their jurisdiction.

Destruction of plants and structures by sabotage, while an ever-present danger, did not seem to have occurred to any extent. The possibilities of contamination by aerial attack or by sabotage was also given some consideration. With suitably planned chlorination, any danger of bacterial contamination is largely eliminated.

An essential requirement, however, is that water must be chlorinated at the outlet end of a reservoir or at the aqueduct intake. This was recognized as good practice in normal circumstances.

Chemical poisoning of a large supply reservoir is hardly practicable, as there are relatively few materials that could be added in sufficient quantity and that are sufficiently soluble and nonreactive with the normal water constituent to do any material harm.

Public Utilities.

So far as progress of the public utility i dustries was concerned, the year 1942 wa marked by accelerated expansion in plant and of services derive therefrom, especially when compared with the year 1941. In th first full year of the war, the electric power industry in particula supported the war effort with considerably larger reserves i generating capacity than had been anticipated at the end of 194 This was accomplished not only by additions to power productio plant but also by using the existing plant more efficiently and fo greatly extended hours of use when compared with peacetim The output in kilowatt hours rose to the unprecedented total o 188,500,000,000, with a power producing capacity expanded t 46,800,000 kw. There was no significant complaint, except in few localities, of shortage in war power requirements and eve these were rapidly overcome. With it all, the electric power i dustry carried its expanded civilian load to 32,200,000 customer representing a country-wide electrification estimated at 80%.

Compared with preceding years, 1942 was a good water yea As a result hydroelectric energy represented one-third of the tot generation. This was also made possible by the growth in hydr electric capacity to 28.4% of the total. This growth was dom nantly in publicly owned plants, the total of which by the end o 1942 reached 17% of the combined public and private capacity.

Some steps had to be taken in order to conserve power capacit for more vital purposes. The introduction of "war-time" wa estimated to have held down the national peak by 1,000,000 k "Dim-out" orders, the stopping of rural electrification projec not nearing the completion stage, decreases in street, highway an ornamental lighting, and a relative decline in the small light an power load due to mortality among commercial customers an small manufacturers unable to convert to war orders, were amon the more significant factors making for a decline in normal us On the other hand, power requirements by war agencies, and i creased sales to electric and interurban railways due to the rubb and gasoline shortages, were countervailing developments whic pushed electricity use to the highest totals yet attained. Signif cantly enough, 1942 began with the cancellation by OPM of i power curtailment program in the southeastern states.

Rationing of scarce and critical war materials also left its mar on the utility industries where line extensions and repairs we held down to the barest essentials. A system of intra-industr inventory control and sharing of excess supplies was inaugurate in order to eliminate regional inequalities. A significant priorit order by WPB redistributed the ultimate use of generating capacity, so that of 9,600,000 kw. of capacity on order for pow systems, some 4,300,000 kw. were given other destinations; whi 1,800,000 kw. were reserved for installation in 1942, a total 2,970,000 kw. in 1943 and 500,000 kw. in 1944. The plant wi these accretions would constitute the power-producing capacit which must see the U.S. through the next war years.

Legislatively, the most significant event was the passage b congress of the act of Oct. 2, 1942, designated to "aid in stabili ing the cost of living." This legislation placed the Office of Pr Administration in a position where it might influence the ra making activities of regulating commissions. Under the terms this act, OPA must be notified 30 days in advance of a rate pr eding and must be given an opportunity to intervene in any se involving rate increases by a public carrier or other public ility. This power to intervene was upheld by a United States cuit court of appeals in the case of an interstate motor carrier the ground that the Interstate Commerce act had been super- led “to whatever extent may be necessary to achieve its own rposes.”

The tendency of the state commission to freeze the level of blic utility rates for the duration of the war, unless there were ecial circumstances requiring an increase in earning capacity in ler to enable a public utility to carry on its functions, was well istrated by an order of the Wisconsin Public Service commis- n in May 1942. The order dismissed an application for an in- ase in telephone rates in Madison, Wis., by the Wisconsin lephone company. Similarly, the Federal Communications com- ssion sought to secure a reduction in the long-distance tele- one toll rates of the American Telephone company because a imed earning capacity of approximately 15% upon the net ok investment after all taxes was deemed excessive during the r emergency.

The most outstanding event of 1942 which was likely to have greatest consequences in the future was the decision of the ited States supreme court in the Natural Gas Pipeline company e on March 16, 1942. In this opinion the majority of the court nitely freed the commission from the requirement hitherto erted by all opinions of the highest court to give preponderant ght to replacement costs in fixing a valuation for rate-making poses.

The gist of the opinion is contained in the following paragraph:

> he Constitution does not bind rate-making bodies to the service of any le formula or combination of formulas. Agencies to whom this legisla- power has been delegated are free, within the ambit of their statutory hority, to make the pragmatic adjustments which may be called for by icular circumstances. Once a fair hearing has been given, proper find- made and other statutory requirements satisfied, the courts cannot rvene in the absence of a clear showing that the limits of due process been overstepped. If the Commission's order, as applied to the facts re it and viewed in its entirety, produces no arbitrary result, our iry is at an end.

Although the case was generally hailed by the press as marking downfall of the 44-year old doctrine of “fair value” as em- ied in the rate-making rule of Smyth *v.* Ames, the minority nion, though agreeing with the disposition of the case, deplored t the majority did not see fit to take this more radical step.

Marking a further and perhaps final step in the marketing of A power, the 1942 session of the Kentucky legislature passed bling legislation which authorized municipalities to acquire construct distribution systems for the purpose of purchasing rgy from the authority at wholesale and distributing it at retail accordance with TVA's well known low-rate and high-use cies. A unique provision of the act was the requirement that e as well as local taxes be actually paid by the distribution ems in an amount at least equal to the taxes paid under vate ownership. Weekly. *Dragon Seed,* by Pearl S. Buck (400,000 copies), was in third place, followed by *And Now Tomorrow,* by Rachel Field (*q.v.*) (93,000), *Drivin' Woman,* by Elizabeth Pickett Chevalier, and *Windswept,* by Mary Ellen Chase (first published in Nov. 1941). On the nonfiction list, Marion Hargrove's *See Here, Private Hargrove* was first with 330,000 copies sold, none through book clubs. Second was Joseph E. Davies' *Mission to Moscow* (published Dec. 29, 1941), followed by *The Last Time I Saw Paris,* by Elliot Paul, *Cross Creek,* by Marjorie Kinnan Rawlings, *Victory Through Air Power,* by Alexander P. de Seversky, and *Past Imperfect,* by Ilka Chase.

Retail Sales.—Despite the decrease in number of titles published, the retail trade continued to grow in 1942. According to a survey conducted by *Publishers' Weekly,* sales exceeded those of 1941 by approximately 20%. Technical books were in great demand, as were books dealing with the war, and juvenile books (an anomaly of the year was the sizeable decrease of new titles in children's books). Interest in fiction, poetry and drama dropped sharply.

Great Britain.—British book production continued to decline numerically in 1942, to 7,241 new titles, reprints and new editions, as compared with 7,581 in 1941, 11,050 in 1940 and 14,904 in 1939. The demand for books was as great as during the years preceding World War II, if not greater; but the industry in 1942 was allotted only 37½% of the paper used in the 12 months ending Aug. 31, 1939. Rationing of other materials and the shortage of manpower were other factors in the curtailed production. Table II, page 573, compiled by the publishers of *The Bookseller* and *Whitaker's Cumulative Book List,* gives the breakdown of British book publishing by classification. (*See* also NEWSPAPERS AND MAGAZINES; AMERICAN LITERATURE; ENGLISH LITERATURE, etc.) (J. V. Do.)

Puerto Rico.

A United States insular dependency in the West Indies; area, 3,400.6 sq.mi.; pop. (1940): 1,869,255, a 21.1% increase over 1930. Whites comprised 76.2%, Negroes, 23.8%. The chief cities are San Juan, the capital (169,247); Ponce (65,182); Mayagüez (50,376); Caguas (24,377); Arecibo (22,134); Río Piedras (19,935). Languages: Spanish and English; religion: predominantly Roman Catholic. Governor in 1942: Rexford Guy Tugwell.

History.—During 1942 Puerto Rico underwent one of the most serious economic crises in her history. Essentially the difficulties rested on shipping shortages which were, in turn, the direct outgrowth of wartime dislocation and disruption. In the face of normal shipping requirements estimated at more than 110,000 tons a month, Puerto Rico was allotted slightly in excess of 30,000 tons. Axis submarine attacks in the Caribbean area and emergency diversion of allocated shipping, also served at times to reduce available tonnage.

As shipping conditions tightened, prices rose from 149.67 points (basis: 1939=100) on Jan. 15 to 172 in June. Many essential food products advanced even more. Rising freight costs served further to accentuate the depressed condition.

Unemployment increased rapidly during 1942. The effects were first felt after the completion early in January of major construction on the Isla Grande air and naval base.

Several plans were tried in order to alleviate conditions. Gov. Tugwell and others made various trips to Washington, D.C., to get additional shipping allocated to the island. In May, at a meeting in Jamaica, supply officers of British and U.S. territorial possessions discussed plans for mutual assistance. Army and navy forces were supplied from the Dominican Republic and Haiti so as to ease demands in Puerto Rican markets. An estimated 15% of cargo space was saved by sending supplies from Florida across Cuba, Haiti and the Dominican Republic.

A redivision of the large landholdings of companies and co porate bodies was begun under the 1941 law. The program wa twofold. It was proposed (1) to sell small farms to qualifie farmers, and (2) to provide housing sites and garden plots fo farm labourers ("agregados"). In March 1942 the insula supreme court ordered the first estate to be partitioned.

Conditions in such export industries as sugar became especiall bad. The sugar mills were made public utilities as a result; i September Gov. Tugwell decided to make another trip to Wash ington for aid. Before he sailed, Senator Luis Muñoz Marín, Liberal leader in the legislature, presented the governor with petition signed by 314,316 persons supporting the Tugwell refor program.

In Washington, the United States senate actively intereste itself in the Puerto Rican situation. Senator Dennis Chavez o New Mexico headed a special investigating committee.

Education.—In 1940 there were 1,733 public schools, wit 286,098 enrolment. The University of Puerto Rico, with nearl 6,000 students in 1942, is the cultural focal point of the island

Finance.—The monetary unit is the United States dolla

Trade and Communication.—During 1942 external trad faced thoroughly adverse conditions. Exports of sugar and simila commodities were especially affected.

Under wartime conditions trade statistics were not made pub lic. In the year ending June 30, 1940, however, imports wer valued at $107,030,482, the United States supplying 93.9%. Th remainder represented chiefly petroleum products from Curaça jute from India, fish from Newfoundland and Canada, corn an other foodstuffs from Cuba and the Dominican Republic. Th United States supplied mainly foodstuffs, textiles, and miscellan ous manufactures, and took sugar, needlework, tobacco, rum fruits and coffee.

Puerto Rico in 1942 had daily air service to the United State and southward to Panama. Internal communication was by rai way (387 mi.) and by 1,487 mi. of main highway, supplemente by local and military roads.

Agriculture.—The island is essentially agricultural. Sugar the leading product, with a 1939–40 production of 1,018,80 tons, of which 868,568 tons were exported. Tobacco is secon (1941 production: 267,500 cwt.), followed by fruits, mainl grapefruit, pineapple, oranges and citron (1940 export valu $1,479,819). In 1940 there were 51,494 work and 112,585 othe cattle, and 22,709 horses, mules and donkeys. Pasture land aggr gated 1,005,560 ac.

Manufacturing.—Manufacturing is for domestic consumptio except for needlework (1940 exports: $12,514,429), sugar pro essing, cigar and cigarette making, and rum production. (C. L. G.)

Pulitzer Prizes.

The Pulitzer prizes in journalism and le ters were endowed by Joseph Pulitzer, pu lisher of the *New York World,* and are awarded annually in th spring by the trustees of Columbia university on the recommenda tion of the advisory board of the school of journalism of th university. In 1942 the award for the play was omitted. T following awards were made: For the novel by an America author, $1,000 to Ellen Glasgow for *In This Our Life;* for a boo on the history of the United States, $2,000 to Margaret Leec for *Reveille in Washington;* for the best American biograph $1,000 to Forrest Wilson for *Crusader in Crinoline,* a life Harriet Beecher Stowe; for the best volume of verse by an Ame ican author, $1,000 to William Rose Benét for *The Dust Whic Was God.* Awards were also made for disinterested public ser

LITZER PRIZE CARTOON of 1941: "British Plane," by Herblock (Herbert Block) of NEA Service, Inc. The award was announced May 4, 1942

by an American newspaper, a $500 gold medal, to the *Los* *geles Times* for its series on the right of free press; for dis-guished reporting, $1,000 to Stanton Delaplane of the *San* *ncisco Chronicle,* who reported the movement of California d Oregon counties to secede and form a 49th state; for dis-guished Washington or foreign correspondence, $500 to Louis rk of the *New York Times* for his reporting of labour, and to urence Edmund Allen, of the Associated Press, for his report- of operations of the British Mediterranean fleet, and to Dr. rlos P. Romulo of the *Philippines Herald* for his articles on far east; for distinguished editorial writing, $500 to Geoffrey sons of the *New York Herald-Tribune,* and for a distinguished toon, $500 to Herbert Lawrence Block, of the Newspaper terprise association. rdue University. An institution of higher education at Lafayette, Ind., founded May 6, 1869, the Indiana link in the chain of land-grant colleges and uni-sities. Degrees in 1942 were offered in agriculture, home eco-nics, pharmacy, science, physical education, education, and the owing branches of engineering: civil, electrical, chemical and allurgical, mechanical and aeronautical, public service and ineering law; trade and industrial education.

ike many other institutions of learning, Purdue in 1942 was red to the U.S. war effort, with the school calendar changed n two semesters of 18 weeks and a summer term to three full ns of 16 weeks each, so that a student might graduate in two two-thirds calendar years.

Vhile the type of training offered in Purdue fitted definitely the war program, there were in addition to the regularly enrolled student body in 1942 hundreds from the navy or army taking special courses lasting from four to eight months. Among them were 850 training as naval electricians; 150 as diesel engine experts; 210 as ferry pilots or flight instructors at the university airport; 60 in a Radar school, 60 in an ultrahigh-frequency class, and many other special types of training. The research program in farm and laboratory, as well as the teaching and the extension program, were also directed into the nation's war program. For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES.

Pyrite. The production of pyrite in the United States in 1941 increased by 5% over 1940, to 659,498 long tons, while imports declined from 407,004 tons in 1940 to 224,264 tons in the first nine months of 1941. The bulk of the imports formerly came from Spain, but shipping difficulties cut these to about one-tenth of their former bulk, and most of the receipts came from Canada. Australia has a large potential output as a by-product in the mining of copper, lead and zinc, but this was not being utilized to any great extent. As indicated by exports to the United States, production in Canada was increasing, but statistics were not published. Operations in Cyprus practically ceased while the area was in the war zone. The Portuguese output was 179,759 metric tons in 1941, about a third of the former output. The Spanish output dropped from 2,600,000 metric tons in 1939 to 490,096 tons in 1941, largely as a result of shortage of shipping space. Data were lacking from other important producing countries. (G. A. RO.)

Quakers: *see* FRIENDS, RELIGIOUS SOCIETY OF.

Quebec. One of the two central provinces of the dominion of Canada (*q.v.*), admitted to the union in 1867; area 594,534 sq.mi.; pop. (1941) 3,331,882, of whom 65% were urban. Capital, Quebec (147,908); largest city, Montreal (890,234). The lieutenant governor in 1942 was Eugene Fiset; the premier, Adelard Godbout.

Education.—The number of students in provincially controlled schools in 1942 was 610,792; in private schools 57,593.

Communication.—The mileage of surfaced highways in 1942 was 19,250; of earth highways 18,918; provincial expenditure on highways $21,389,804. The railroad mileage in 1942 was 4,804.

Finance.—The ordinary receipts in 1942 were $59,153,857; ordinary expenditure $66,441,201. The direct debt (less sinking funds) was $387,747,347, indirect liabilities (less sinking funds) $38,554,517.

Agriculture.—The acreage of field crops in 1942 was 5,995,400; gross value of all agricultural crops $213,116,000.

Manufacturing.—The gross value of manufactured products in 1940 was $1,357,375,776; net value $595,552,909; number of employees 252,492; salaries and wages $277,639,876.

Table I.—*Leading Agricultural Products of Quebec, 1941 and 1940*

Crop	1941	1940
Wheat, bu.	567,000	522,000
Oats, bu.	46,872,000	44,290,000
Barley, bu.	3,762,000	3,888,000
Corn, bu.	581,000	552,000

Table II.—*Principal Industries of Quebec, 1939 and 1938*

Industry	Value of products	
	1939	1938
Pulp and paper	$103,564,981	$88,990,115
Smelting and refining	86,005,322	78,954,445
Cotton, yarn and cloth	49,176,421	39,568,088
Tobacco, cigars and cigarettes	39,986,847	39,156,515

Mineral Production.—The value of the mineral production of Quebec in 1940 was $86,313,491.

Table III.—*Principal Mineral Products of Quebec, 1940 and 1939*

Mineral	Value	
	1940	1939
Gold	$39,238,238	$34,455,998
Copper	...	11,831,749
Nickel	14,476,814	...
Lead	..	...
Zinc	...	882,606
Silver	1,340,540	472,675
Asbestos, etc.	16,931,476	15,858,492

(J. C. HE.)

Queensland. A state of the Australian commonwealth lying in the northeast and occupying 670,500 sq.mi.; pop. (est. Dec. 31, 1941) 1,036,830. Chief cities (pop. Dec. 31, 1939): Brisbane, cap., 528,000; Rockhampton 32,600; Townsville 31,450. Governor (1942): Sir Leslie Orme Wilson.

History.—Forgan Smith, who was elected labour premier in 1932 and had held that post continuously ever since, resigned in Sept. 1942, in order to devote his services more directly to war work. He was succeeded by F. A. Cooper, the state treasurer.

Consequent upon war developments in the Southwest Pacific zone, the trend of economic organization in Queensland was naturally towards the establishment of specific defense works. Strategic roads connecting with the northern coast were built, large airfields for the use of United States as well as Australian air forces were constructed, and munition factories and cold storage facilities were enlarged. Unemployment reached an irreducible minimum, and women were drafted into both agricultural and manufacturing industries.

Successful experiments were undertaken for the production of rubber from the indigenous rubber vine which grows wild in the Charters Towers district.

The state budget revealed a surplus of £A63,772 for 1941–42. The loan council allocation for loan expenditure during 1942–43 for Queensland was £A1,626,000, mostly for inescapable defense necessities.

Education.—In 1940: schools, 1,914; scholars, 171,391.

Finance.—Revenue (1941–42) £A23,662,947; expenditure (1941–42) £A23,599,175.

Communication.—In 1940: roads, motor 49,973 mi.; railways (Dec. 31, 1941) 6,497 mi. Motor vehicles licensed (March 31, 1942), 64,128 cars and taxis; 44,051 commercial; 6,187 cycles. Wireless receiving set licences 173,265. Telephones, 85,847.

Agriculture, Manufacturing, Mineral Production.—Production in 1940–41: sugar cane 800,000 tons; wheat 5,700,000 bu.; maize 3,733,424 bu.; wool 194,200,000 lb.; gold (1939) 145,667 fine oz.; silver (1939) 3,600,000 oz.; coal 1,121,000 tons. Industry, manufacturing, 1939–40: factories 3,064; employees (average) 55,541; production, gross value of output £A68,753,142.

(W. D. MA.)

Racing and Races: *see* AIR RACES; AUTOMOBILE RACING; DOG RACING; HORSE RACING; TRACK AND FIELD SPORTS.

Radio. Manufacture of all types of radio receiving sets (including television and FM) was frozen by order of the War Production board but set inventories were sufficiently high to allow sales throughout the year. The total number of receiving sets in the United States at the end of 1942 was pegged at 59,340,000 distributed among 87% of the American homes. This compared with a figure of 57,000,000 sets a year earlier. In line with the government's hemispheric solidarity program, some 2,500,000 sets were delivered to countries in Latin America in 1942, according to best available information, for a grand total of 6,000,000 receivers in those nations.

On Jan. 1, 1942, in the United States there were 918 standard broadcast stations licensed and 909 in operation. Acting upon a directive of the War Production board, caused by scarcity o materials needed for transmitter manufacture, the Federal Communications commission discontinued licensing of new standard broadcast stations. Several stations voluntarily discontinued operations during the year, turning in their licences, because of loss of revenues, the war's drain on technical personnel and other factors. These, however, were in secondary areas, otherwise served by stations with higher powers.
